Dioxin-like compounds are lipid soluble, poorly eliminated and thus can accumulate in human fat, including the lipids of human milk. Since PCDD/F concentrations in blood and human milk are reasonably similar when concentrations are expressed on a lipid basis, human milk levels can provide a monitoring tool for exposure of a given population in a particular area (Päpke, 1998). Recently a reasonably comprehensive study on levels of PCDD/Fs and dioxin-like PCBs in human milk samples from Australian primiparous mothers has been published (Müller et al, 2003a); these results are considered below, with respect to estimating levels of exposure of the Australian population to dioxin-like compounds.

The objective of the study by Müller et al (2003a) was to investigate the levels of dioxins and dioxin-like compounds (PCDD/Fs and PCBs) in pooled human milk samples of cohorts from Australian urban, industrial and rural environments. The protocol used was identical to that used by the World Health Organization (WHO) in international studies conducted during 1987/88, 1992/93 and 2003. Once lactation was established, about 100 ml of milk was collected by each of the study participants, from which aliquots of 30 ml from each of ca. 10 mothers were pooled to give samples of about 300 ml, representing 12 regions. Besides exposure, the key factors affecting the levels of dioxin-like compounds in human breast milk are the number of children that have been breast fed by an individual (Fürst et al. 1989; Yang et al, 2002), the duration of the lactation period and maternal age (Fürst et al, 1992b). The first two factors were controlled by limiting participants to primiparous mothers breastfeeding an infant aged between 2 and 8 weeks post-partum. The mean age ($\pm$ SD) of mothers in the study was 30.7 $\pm$ 4.5 years, with the individual pools ranging from 26.8 $\pm$ 5.4 to 34.0 $\pm$ 3.4 years.

Pooled samples from Adelaide (2 separate pools), Brisbane, Darwin Hobart, Melbourne (4 pools), Perth and Sydney (2 pools) represented urban environments, Newcastle and Wollongong each provided a pooled sample representing more industrialised urban environments, while samples from the regional centres of Dalby and Bendigo/Ballarat/Lakes Entrance provided two pools representing rural regions. In total,

173 samples were collected from 12 regions between October 2001 and September 2003. Of these, 16 were excluded because they were found to have violated the inclusion/exclusion criteria. The remaining 157 samples were analysed as 17 pooled samples.

In addition to these samples a further 24 "historical" samples that were collected in 1993 were obtained from the Faculty of Life Sciences, School of Medical Sciences at RMIT University, Melbourne (courtesy of Prof. Jorma Ahokas). They were analysed as three pools of eight samples, to give a total of 20 pooled samples for analysis.

All pooled samples were assayed by the Australian Government Analytical Laboratories (AGAL), Sydney, and two duplicate samples were sent to the State Laboratory of Nordrhein-Westfalen, Münster, Germany. Both laboratories are accredited for dioxin analysis.

Dioxin-like chemicals were detected in all pooled samples. It should be noted that because of good assay sensitivity and the fact that a significant number of the congeners of the PCDD/F and PCBs were detected in the samples, the differences between lower-, middle- and upper-bound means and medians in this study were quite small. For samples collected during 2001-2003, the mean and median upper-bound levels of summed PCDD/Fs and PCBs, were 9.0 and 8.9 pg WHO-TEQ/g lipid, respectively (see Appendix IX). The average lipid concentration of all pooled samples was 3.7 $\pm$ 0.5%.

Of all analysed samples, PCDD and PCDF congeners were detected in 93% and 62%, respectively. The levels of TCDD detected in all samples were very low and ranged from <0.6 pg/g lipid in the Wollongong sample to 1.4 pg/g lipid detected in one of the two pooled Sydney samples. The average contribution of TCDD to the total WHO-TEQ for all pooled samples was 8.7%. On a concentration pg/g lipid basis, OCDD was the PCDD/F congener with the highest concentration in all pooled breast milk samples. Table 3-11 below lists the congeners making the most contribution to total WHO-TEQ in the breast milk and blood plasma (see Section 3.1.1). On average, the PCBs contributed about 30% of the total WHO-TEQ in breast milk.

**Table 3-11 Main congeners contributing to total WHO-TEQ - breast milk and blood**

| Congener | Breast Milk (1993) | Breast Milk (2001-2003) | Blood Plasma |
|---|---|---|---|
| *TCDD/Fs* | | | |
| 1,2,3,7,8-PeCDD | 26.9% | 25.5% | 19.0% |
| 2,3,4,7,8-PeCDF | 12.8% | 13.8% | 8.1% |
| 1,2,3,6,7,8-HxCDD | 10.4% | 9.6% | 11% |
| *non-ortho-PCBs* | | | |
| PCB126 | 12.7% | 18.9% | 18.0% |
| *mono-ortho-PCBs* | | | |
| PCB156 | 5.9% | 7.0% | 9.2% |

In breast milk collected in or close to an industrial area of Wallonia in Belgium (Focant et al, 2002) 2,3,7,8-TCDD, 1,2,3,7,8-PeCDD, 2,3,4,7,8-PeCDF and PCB-126 accounted for more than 90% of the WHO-TEQ. In breast milk from two areas in Korea, 2,3,4,7,8-PeCDD was the predominant PCDD/PCDF congener, with 2,3,7,8-TCDD being less than 3% of total PCDDs/PCDFs (Yang et al, 2002).

No obvious or systematic differences were observed in the levels of dioxin-like chemicals in breast milk samples collected from different regions of Australia during 2001-2003. Thus there were no significant difference between samples taken from urban and regional rural centres or between industrialised urban and other centres (see Appendix X). Levels, expressed as upper bound WHO-TEQs varied by a factor of 2.5, from a minimum value of 6 pg WHO-TEQ/g lipid in the rural Queensland sample to 15.2 pg WHO-TEQ/g lipid in the Brisbane sample (one pool from this city). The lowest concentrations were found in samples from a rural centre in Queensland, Wollongong (a quite heavily industrialised city), Adelaide (one of the two pools from this city), and Hobart. The higher value in the Brisbane sample was somewhat unexpected since in a previous study carried out as part of the worldwide WHO study on dioxins in breast milk, levels in a Brisbane sample were found to be close to the mean level observed of 8.3 pg WHO-TEQ/g lipid. The present result reflects an unusually low lipid content of 2.8% in the Brisbane sample, cf. 3.8 ± 0.5% for all remaining 16 samples. For results that are expressed on a lipid basis, a reduced lipid content can cause an overestimation of the actual concentration. If lipids are degraded in a sample (eg. when a sample is not adequately stored), an increase in the levels of dioxin-like compounds per unit lipid may be expected. The sampling design of this study relied on mothers collecting and storing samples themselves. Although instructions were provided, the study authors stated that it was unknown whether these instructions were always followed explicitly.

For samples collected from Melbourne women in 1993, the mean and median levels (upper bound) of PCDD/Fs and PCBs were 16 and 16.4 pg WHO-TEQ/g lipid, respectively (see Appendix IX). The average lipid concentration of these pooled samples was 3.9 $\pm$ 0.7%.

A comparison of the samples collected from Melbourne women in 1993 with those collected for the present study (2001 - 2003) clearly shows that the levels of dioxin-like compounds decreased over the ten-year time period. This is apparent if the comparison is done with all pooled samples from 2001 -2003 or just with the 4 Melbourne pools, for which the mean and median levels (upper bound) were 9.3 and 8.8 pg WHO-TEQ/g lipid. It should be noted that details of maternal parity and infant age at date of collection was not available for the older samples. However, despite this limitation, a clear decrease in the levels of these compounds over time was observed. The concentration decreased by approximately 45% between 1993 and 2001-2003. Consistently, PCDD/Fs as well as PCBs decreased in the samples.

**Table 3-12 Change in WHO-TEQs in breast milk over 10 years**

| pg WHO-TEQ per g lipid | 1993 Samples | 2001-2003 Samples | |
|---|---|---|---|
| | Melbourne (3 pools) | Australia (17 pools) | Melbourne (4 pools) |
| Mean | 16.0 | 9.0 | 9.3 |
| Median | 16.4 | 8.9 | 8.8 |

Data are upper bound means and medians.

A plot of the WHO-TEQ versus average age of donor mothers found no significant correlation ($r^2 = 0.16$). Similarly, the New Zealand breast milk study did not identify any relationship ($r^2 = 0.10$) between age and dioxin levels (Bates et al, 2001). Other studies have found a positive correlation between increasing maternal age and the levels of dioxin-like compounds (Fürst et al, 1992b; Beck et al, 1989); the lack of such a correlation in the Australian and New Zealand populations could possibly be due to the lower overall levels of dioxin-like compounds compared with breast milk levels in Europe and North America. Nevertheless, this relationship would be better assessed by examining individual rather than pooled samples.

The 1987/88 and 1992/93 international comparison studies organised by the WHO indicated that levels of dioxins in human milk were relatively high in industrialised countries when compared with non-industrialised countries (Liem et al, 2000). However, these international studies noted an average decline of breast-milk dioxin levels between the 2nd round investigation in 1992/1993 and the 3rd round in 2003 of about 40% (Malisch & Van Leeuwen 2003), with the largest declines in countries with the highest initial levels (Van Leeuwen & Malisch, 2002). In Japan, assays of breast milk samples collected in Osaka between 1973 - 1996 and stored frozen showed that the concentrations of dioxin-like compounds decreased by 50% over that period (Hirayama, 2000). Consistent with worldwide trends, the levels of dioxin-like compounds in the breast-milk of Australian mothers have significantly decreased over a ten-year period from 1993 to 2003.

As noted above, no consistent trends were observed between pools obtained from rural, industrial or urban regions of Australia. This is in agreement with results obtained in other studies in New Zealand (Bates et al, 2001) and Europe (Fürst et al, 1992b, Deml et al, 1996).

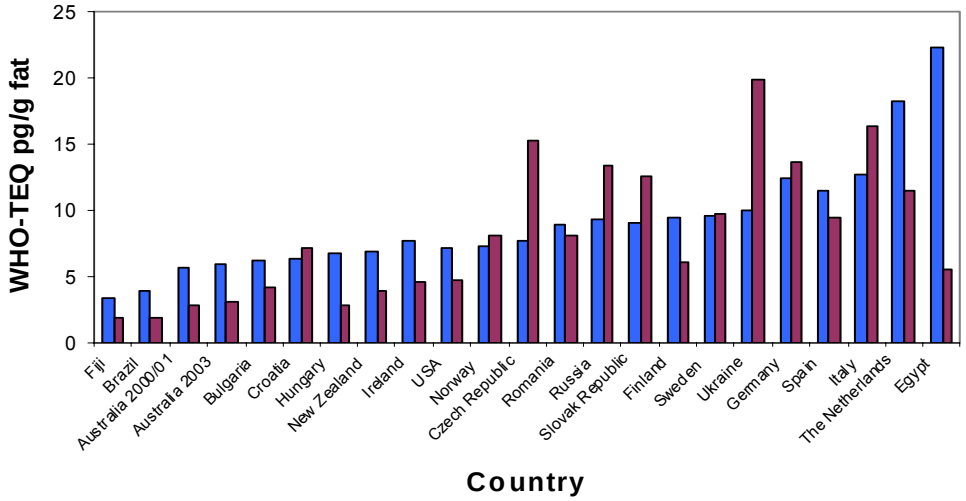

**Figure 3-9 Comparison of levels of PCDD/Fs and PCBs in pooled human milk. (The first column for each country represents PCDD/Fs and the second, PCBs.)**

Figure 3-9 graphically presents a comparison of PCDD/Fs and PCBs (as WHO-TEQ pg/g lipid) from the 3rd round WHO study from 2003. The lowest levels of PCDD/Fs and dioxin-like PCBs were found in the Southern hemisphere (Fiji, Brazil, Australia and New Zealand); in fact, after Fiji and Brazil, Australia had the third lowest levels of the 22 countries included in the comparison. Egypt had the highest WHO-TEQ levels for PCDD/Fs and the Ukraine had the highest WHO-TEQ for PCBs (Malisch & Van Leeuwen, 2003). Van Leeuwen & Malisch (2002) noted that for only a few countries (Australia, Brazil, Bulgaria and Hungary) were the observed levels for all three groups of compounds (PCDD/Fs, dioxin-like PCBs and indicator PCBs) consistently lower than other countries.

Higher levels than reported above have been reported from mothers living near heavily industrialised sites. Thus, relatively high levels of dioxin-like compounds have been reported in 20 non-pooled breast milk samples collected in or close to an industrial area of Wallonia in Belgium (Focant et al, 2002); PCDD/F concentrations ranged between 16.0 - 52.1 pg WHO-TEQ/g fat, with a mean of 29.4 pg TEQ/g fat. If coplanar PCBs (77, 126, 169) were included, levels ranged between 22.2 - 100.2 pg TEQ/g fat, with a mean of 40.8 pg TEQ/g fat. Similarly, the mean content of dioxins in seven pooled samples of human milk (40 individual trials) from Chapaevsk in Russia was 42.26 pg TEQ/g fat; Chapaevsk, in the Samara Region, is home to the Middle Volga chemical plant which produced hexachlorocyclohexane (lindane) and related chemicals from 1967 to 1987 (Revich et al, 2001).

Breast milk and blood have both been used to estimate body burdens of dioxin-like compounds in humans. Results of previous studies indicate that congener profiles differ somewhat between the two media. For the present study, no blood samples were collected from the participants and so the results obtained from blood serum study (Harden et al, 2004; see Section 3.1.1) were used for comparative purposes. Blood serum data were modelled to take into account age and then compared with predicted results on the basis of the average age of the donor mothers in each milk pool; overall, there was reasonably good agreement between the results from breast milk and plasma (for further details see Müller et al, 2004).

Despite the overall good comparability of the data from the blood and the breast milk study it may be noted that the PCDD/F and PCB congener profiles in the breast milk samples are slightly different from those observed in the blood study of the same age group. Specifically, PCBs and lower chlorinated dibenzodioxins occurred at similar or higher concentrations in breast milk samples compared to the blood samples. However with increasing level of chlorination (i.e. increasing hydrophobicity), there was a shift towards higher concentrations of congeners in the blood compared with breast milk.

In conclusion, the levels of dioxin-like chemicals in the breast milk of Australian women are similar across all regions of Australia but low by international standards. Consistent with world-wide trends, the levels of dioxin-like compounds have decreased over a ten-year period from 1993 to 2003, reflecting a global trend over recent decades of declining levels of dioxin-like compounds in the environment and in human tissues.

Since breast-milk levels can be taken to indicate the extent of exposure to dioxin-like compounds (after controlling for the number of children that have been breast fed by an individual, the duration of lactation, and maternal age), the international comparison of breast-milk levels of PCDD/Fs and PCBs for 22 countries indicates that Australian population exposures (including mothers and their breast-fed infants) are close to the lowest end of the scale.

Infants' dietary intake of PCDD/Fs and PCBs from breast milk is considered in Section 3.2.3.

## 3.2 Dietary Intake

As demonstrated by a variety of international risk assessments for dioxins, dietary exposure is expected to represent the greatest proportion of the overall intake of dioxins. Food Standards Australia New Zealand (FSANZ) conducted a survey of dioxins in a range of foods, which are representative of the total diet, in order to estimate the dietary exposure of Australians to dioxins (FSANZ, 2004). The contribution of dietary intake to the overall intake of dioxins and a comparison of the estimated dietary intake with the TMI are included in Chapter 4, Section 4.1.

### 3.2.1 Food Intake assessment

#### *3.2.1.1 Survey of Australian foods for dioxin levels*

Since no data existed in Australia on dioxin concentrations in food, an analytical survey was required before a dietary exposure assessment could be conducted.

Dioxin concentration data were obtained from the analysis of a range of foods sampled. A total of 168 composite samples of 22 different foods were analysed. Details of these foods are given in Appendix XI. Foods likely to have higher levels of dioxins (*eg.* meat, fish and dairy products) and those foods that are central to the Australian diet ('core foods' such as bread, potatoes, orange juice) were analysed.

Each sample analysed for dioxins was made up of a composite of four food purchases for core foods, or three food purchases for all other foods. Where appropriate, the composite food samples were prepared to a 'table ready' state before analysis, thus best representing the amounts of dioxins that would be consumed. For example, meat and eggs were cooked, while no additional preparation occurred for composite milk or bread samples. Details of the preparation undertaken for each food are available in the Supplementary Information (Part 5) to the 20th ATDS on the FSANZ web site (www.foodstandards.gov.au).

The methods used for the analysis of dioxins in food were based on the United States Environmental Protection Agency (US EPA) *Method 1613 Revision B* for PCDDs/PCDFs and *Method 1668 Revision A* for PCBs. Both methods use the technique of isotope dilution with high-resolution mass spectrometry for dioxin determination. These methods are available on the US EPA web site (www.epa.gov).

Survey samples were analysed for the 29 PCDD, PCDF and PCB congeners for which the WHO derived toxic equivalency factors (TEFs) for human risk assessment. WHO Toxic Equivalents (WHO-TEQs) (picograms/gram) were calculated by summing the weighted concentrations for each of the 17 specified PCDD/F and 12 PCB congeners, on both a fresh weight and lipid weight basis, for each food analysis. For foods with very low levels of lipid (*eg.* orange juice), WHO-TEQs were determined on a fresh weight basis only. Results were reported as both the lower bound and upper bound WHO-TEQs for each food sample (see introductory section for Chapter 3), noting that in this study the limit of quantitation (LOQ) rather than the limit of detection (LOD) was used and the LOQ is higher than the LOD.

No analysis of drinking water was carried out as a part of this survey. Given the exceedingly low water solubility of dioxins, there is virtually no exposure from drinking water, whether or not the water is chlorinated.

A summary of the mean PCDD/F and PCB concentrations for each food used in the dietary modelling is shown in Table 3-13. Individual composite sample PCDD/F and PCB summary results are available from FSANZ (FSANZ, 2004).

Peanut butter was selected for inclusion in the dioxin survey as it is a relatively high fat product, and can be a high consumption food in the diet of children. While still at a relatively low level, the lower and upper bound results for one peanut butter sample were unexpectedly high in PCDD/F (0.14-0.32 pg WHO-TEQ/gram) compared to other foods analysed in the survey. The high result was still included in the dietary modelling because it was from random samples of peanut butter available on supermarket shelves for purchase and consumption by the general public. The mean value of the four peanut butter analyses was used for the dietary modelling.

Of the ten composite fish fillet samples analysed, one sample contained greater amounts of PCBs than all the other composite samples. The high result was still included in the dietary modelling because it was from random samples of fish fillets available in supermarket for purchase and consumption by the general public. The mean value of the ten fish fillet analyses was used for the dietary modelling.

**Table 3-13 Mean levels of PCDD/Fs and PCBs in Australian food**

| Food | Number of composite samples | PCDD/Fs | | PCBs | |
|---|---|---|---|---|---|
| | | Lower Bound pg WHO-TEQ/g | Upper Bound pg WHO-TEQ/g | Lower Bound pg WHO-TEQ/g | Upper Bound pg WHO-TEQ/g |
| Bacon | 10 | 0.0135 | 0.0613 | 0.0117 | 0.0214 |
| Baked beans | 3 | 0.0002 | 0.0139 | 0.0011 | 0.0024 |
| Bread, white | 3 | 0.0004 | 0.0210 | 0.0003 | 0.0045 |
| Butter | 10 | 0.0105 | 0.1984 | 0.0173 | 0.0697 |
| Chicken breast | 11 | 0.0006 | 0.0156 | 0.0038 | 0.0057 |
| Eggs | 13 | 0.0026 | 0.0447 | 0.0062 | 0.0121 |
| Fish fillets | 10 | 0.0803 | 0.1269 | 0.5097 | 0.5100 |
| Fish portions | 9 | 0.0013 | 0.0183 | 0.0175 | 0.0204 |
| Hamburger | 10 | 0.0002 | 0.0197 | 0.0003 | 0.0069 |
| Infant formula | 5 | 0.0016 | 0.0150 | 0.0019 | 0.0027 |
| Lamb chops | 11 | 0.0004 | 0.0360 | 0.0040 | 0.0091 |
| Leg ham | 9 | 0.0004 | 0.0137 | 0.0012 | 0.0030 |
| Liver pate | 4 | 0.0005 | 0.0325 | 0.0020 | 0.0104 |
| Margarine | 6 | 0.0006 | 0.0508 | 0.0019 | 0.0071 |
| Milk chocolate | 1 | 0.0029 | 0.0440 | 0.0048 | 0.0120 |
| Milk, whole | 13 | 0.0010 | 0.0065 | 0.0013 | 0.0060 |
| Minced beef | 14 | 0.0008 | 0.0328 | 0.0046 | 0.0148 |
| Orange juice | 3 | 0.0000 | 0.0071 | 0.0002 | 0.0004 |
| Peanut butter | 4 | 0.0350 | 0.2350 | 0.0003 | 0.0132 |
| Potatoes | 3 | 0.0002 | 0.0127 | 0.0001 | 0.0016 |
| Sausage | 11 | 0.0013 | 0.0407 | 0.0083 | 0.0171 |
| Tuna, canned | 5 | 0.0024 | 0.0142 | 0.0269 | 0.0272 |

All samples are composites of three or four purchases.
All results are reported on a fresh weight basis.

#### *3.2.1.2 International comparison of dioxin levels in food*

Comparison of dioxin concentrations in food across different monitoring programs is difficult since there are differences in foods sampled, analytical methodologies and calculation and reporting of TEQs. Furthermore, some data may have been collected up to a decade ago and dioxin intakes would have fallen in the last decade. Therefore, a comparison of contemporary data with older data should be done cautiously. However, Tables 3-14 and 3-15 give some indication of the measured concentrations of dioxins in selected Australian foods compared with those measured in foods from other areas of the world. Data for the tables were derived from data reported by the European Commission (2000), the Codex Alimentarius Commission (2003), the US EPA (2000) and the Buckland et al (1998a), unless otherwise indicated. It should be noted that the Australian values reported in Table 3-14 are WHO-TEQs, which are 10-20% higher than the I-TEQs reported for other areas of the world.

Generally, Australian foods have levels of PCDD/Fs and PCBs that are similar to those reported in New Zealand and lower than those reported from other areas of the world.

**Table 3-14 A comparison of PCDD/F concentrations in selected foods from different areas of the world.**

| Food | Mean PCDD/F I-TEQ (pg/g lipid weight) | | | | |
|---|---|---|---|---|---|
| | Australia[1] | New Zealand[2] | USA | Europe[9] | Asia[9] |
| Beef | 0.0006-0.24 | 0-0.11 | 0.89-2.86[5] | 0.68 | 1.0 |
| Pork | 0.05-0.22[3] | 0-0.20[4] | 0.64-3.97[5] | 0.26 | 0.8 |
| Lamb | 0.004-0.25 | 0-0.07 | - | - | - |
| Poultry | 0.02-0.53 | 0.037-0.29 | 0.10-5.17[5] | 0.524 | 0.67 |
| Fish | 1.56-3.04 | 0.33-0.41 | 2.45-21.1[5] | 9.92 | 0.002-10.2[6] |
| Eggs | 0.013-0.42 | 0.017-0.12 | 0.8 | 1.19 | - |
| Milk | 0.04-0.23 | 0.019-0.16 | 0.98[7] | 0.97 | 0.3-1.8 |
| Bread/cereals[6] | 0.00039-0.021 | 0.0012-0.0059 | - | 0.019 | - |
| Fruit/ vegetables[6] | 0.000023-0.013 | 0.0012-0.0016[8] | - | 0.029 | - |

[1]-Values are WHO-TEQs which are 10-20% higher than I-TEQs and are reported as range of lower bound to upper bound
[2]-All New Zealand values reported a range of lower bound to medium bound
[3]- Assumes bacon is representative of all pork products
[4]-Pork meat
[5]- Values reported in Schecter et al (1997)
[6]- On a fresh wt basis
[7]- Calculated from fresh wt assuming 3.2% fat
[8]- Includes fried potatoes
[9]- Whether values represent lower and upper bound means was not reported

**Table 3-15 A comparison of PCB concentrations in selected foods from different areas of the world.**

| Food | Mean PCB WHO-TEQ (pg/g lipid weight) | | | | |
|---|---|---|---|---|---|
| | Australia[1] | New Zealand[2] | USA | Europe | Asia |
| Beef | 0.03-0.11 | 0.0036-0.092 | 0.49 | 0.914 | - |
| Pork | 0.04-0.07[3] | 0.15-0.43[4] | 0.06 | 0.09-0.81[5] | - |
| Lamb | 0.02-0.06 | 0.01-0.045 | - | - | - |
| Poultry | 0.18-0.24 | 0.018-0.14 | 0.29 | 0.59-0.7[5] | - |
| Fish | 9.46-9.5 | 0.77 | 30[7] | 35.3 | 0.004-2.0[5] |
| Eggs | 0.04-0.11 | 0.05-0.11 | 0.87[10] | 0.44-1.5[5] | - |
| Milk | 0.04-0.11 | 0.027-0.15 | 0.5[9] | 1.25 | - |
| Bread/ cereals[6] | 0.0003-0.005 | 0.00099-0.004 | - | 0.11 | - |
| Fruit/ vegetables[6] | 0.00006-0.0016 | 0.0012-0.0025[8] | - | 0.03-0.12[5] | - |

[1]-Values are reported as range of lower bound to upper bound
[2]-All New Zealand values reported a range of lower bound to medium bound
[3]- Assumes bacon is representative of all pork products
[4]-Pork meat
[5]-Range of min-max values reported
[6]- On a fresh wt basis
[7]- Calculated from fresh wt of fresh water fish and shellfish assuming 4% fat
[8]- Includes fried potatoes
[9]- Calculated from fresh wt, assumes 3.2% fat
[10]-Calculated from fresh wt, assumes 11.5% fat

#### *3.2.1.3 Dietary exposure assessment*

The dietary exposure assessment was conducted using dietary modelling techniques that combine food consumption data with dioxin concentration data to estimate the exposure to dioxins from the diet. The dietary exposure assessment was conducted using FSANZ's dietary modelling computer program, DIAMOND (for Dietary Modelling of Nutritional Data). This program is based on individual dietary records from a very large number of respondents. It contains a range of databases including:

- food consumption data from single 24-hour recall surveys (3 national dietary surveys conducted in Australia between 1983 and 1995 [2 years old and above surveyed], plus a 1997 New Zealand dietary survey [15+ years old])

- food chemical concentration data (MRLs for pesticide residues, Maximum Levels for contaminants, Maximum Permitted Levels for food additives; pesticide residue levels in food commodities from supervised field trials, surveys for levels of pesticide residues and contaminants in raw and processed food; manufacturers' data for levels of food additives)

- a recipe database (used to split prepared food into its constituent raw commodities).

Utilising its databases, this program can rapidly calculate, for different population subgroups, whether the dietary intake of a chemical in food exceeds the established health standard.

The exposure to dioxins was estimated by combining usual patterns of food consumption, as derived from the 1995 national nutrition survey (NNS) data, with concentrations of dioxins in foods as determined by the FSANZ analytical survey.

The age-gender groups assessed were infants (9 months), toddlers (2-4 years), boys and girls aged 4-15 years, males and females aged 16-29 years, males and females aged 30-44 years, males and females aged 45-59 years and males and females aged 60 years and over. In addition, exposure to dioxins was estimated for males, females and both genders combined from 2 years of age and above.

As there were no food consumption data available from the NNS on children under 2 years, a diet was constructed to enable dietary exposure to dioxins for infants at 9 months of age to be calculated. The recommended energy intake for a 9 month old boy at the 50th percentile weight was used as the basis for the model diet (WHO, 1983). Boys' weights were used because boys tend to be heavier than girls at the same age and therefore have higher energy and food requirements. It was assumed that 50% of the energy intake was derived from milk and 50% from solids (Hitchcock et al., 1986). The patterns of consumption of solid foods for a 2 year old child from the NNS were scaled down and used to determine the solid portion of the nine-month-old's diet. Certain foods such as nuts, coffee and alcohol were removed from the infant diet since nuts can be a choking risk (NHMRC, 2003) and coffee and alcohol are unsuitable foods for

infants (ACT Community Care, 2000). All milk consumption was assumed to be in the form of infant formula.

Only mean exposure to dioxins for this 9-month old age group was calculated. The 9-month old average diet was constructed by making a number of assumptions regarding energy intake and extrapolations from a 2-year old's diet. In constructing a 95$^{th}$ percentile diet for infants at 9 months, it could be assumed that a high consuming infant at 9 months would eat the same foods as a high consuming toddler at 2 years. However, this is unlikely to be the case, as a high consuming infant at nine months would eat more energy-dense foods. There was not enough information from references to enable a diet for a high consuming infant to be derived, and there are no individual food consumption data on high consuming infants from nutrition surveys. Therefore, there was no evidence to validate any extrapolations and assumptions for a high consuming infant. Consequently, estimated 95$^{th}$ percentile exposures for infants at 9 months were not calculated.

The 22 foods surveyed and analysed were matched (or mapped) to the foods reported as consumed in the NNS. This process assigns the levels of dioxins in the surveyed foods to the appropriate food consumption data to estimated dietary exposure to dioxins. In the mapping it was assumed that:

- all cereal products have the same PCDD/F and PCB concentration as white bread;
- crustaceans and molluscs have the same PCDD/F and PCB concentration as fish fillets;
- all vegetables have the same PCDD/F and PCB concentration as potatoes;
- all fruit and fruit juices have the same PCDD/F and PCB concentration as orange juice.

Given that it is impractical to analyse all foods in the food supply, a single food may be assumed to represent a whole groups of foods. For mixed foods, recipes were used to assign their ingredients to the appropriate survey food. Dioxins in some raw foods were also assumed to be carried over into the processed food proportional to the amount of fat in the product.

In the dietary modelling some general assumptions were made including:

- where a food containing PCDD/Fs and PCBs was included in a particular food group, all foods in that group contain the chemicals at the specified concentration for that group;
- any foods not analysed or included in a particular food group (*eg*. sugar, tea, coffee, soft drinks and alcoholic beverages), are assumed to contain no dioxins due to their extremely low fat content, except if they were mixed foods and their ingredients were analysed;

- for upper bound estimates of exposure, the concentrations of each of the congeners was taken as the LOQ for all cases where dioxin concentrations were reported as less than the LOQ;
- consumption of foods as recorded in the NNS represents current food consumption patterns; and
- consumers eat the same every day of the month.

There are several limitations associated with the dietary modelling including:

- monthly intakes of dioxins are based on 24-hour food consumption data (this is more of a limitations for foods not consumed daily, such as fish);
- exposures for high consumers are likely to be overestimated due to the use of 24-hour food consumption data; and
- the small number of foods analysed and the small number of random samples taken provides only a small subset of data on dioxin concentrations in the Australian food supply.

The DIAMOND program multiplies the specified concentration of dioxin by the amount of food that an individual consumed in order to estimate the exposure to each food. The exposures of each individual were then ranked and population exposures (mean and 95$^{th}$ percentile) were derived. To estimate dietary exposures on a per kilogram of body weight basis, each individual's total dietary exposure to dioxins from all foods was divided by their own body weight (as reported in the NNS), the results for all individuals were ranked, and population statistics (mean and 95$^{th}$ percentile exposures) were derived. Daily exposures, in picograms WHO-TEQ per kilogram of body weight, were multiplied by 30 to estimate monthly exposures.

Exposures to PCDD/Fs were calculated separately to PCBs for each population group. The exposure to total dioxins from all foods for each population group was then determined by summing the separate PCDD/F and PCB exposures.

Percentage contributions of each food group to total estimated exposures were calculated by dividing the sum of all consumers' exposures from one food group by the sum of all consumers' exposures from all foods containing dioxins, and multiplying this by 100.

Because the foods that were surveyed represent a wide range of foods commonly consumed as a part of the Australian diet, all dietary survey respondents were considered to be consumers of dioxins. Therefore, all results are reported on an 'all respondent' basis. Mean estimated monthly dietary intake data for PCDD/Fs and PCBs per kilogram of body weight for each population group are given in Table 3-16. Figure 3-10 shows the mean upper and lower bound estimates of total dioxin intake per kilogram bodyweight for each of the age groups. The 95$^{th}$ percentile estimated monthly intakes of PCDD/Fs and PCBs per kilogram of body weight are given in Appendix XII (except for infants because a 95$^{th}$ percentile was not calculated for this age group).

**Table 3-16 Mean estimated monthly dietary exposure to dioxins**

| Sex | Age Group | PCDD/Fs (pg WHO-TEQ/kg bw/month) | | PCBs (pg WHO-TEQ/kg bw/month) | | Total Dioxins (pg WHO-TEQ/kg bw/month) | |
|---|---|---|---|---|---|---|---|
| | | Lower Bound | Upper Bound | Lower Bound | Upper Bound | Lower Bound | Upper Bound |
| All | 2+ | 0.9 | 10.2 | 2.8 | 5.4 | 3.7 | 15.6 |
| Males | 2+ | 0.9 | 10.9 | 3.1 | 5.9 | 4.1 | 16.9 |
| Females | 2+ | 0.8 | 9.5 | 2.6 | 5.0 | 3.4 | 14.5 |
| Infants | 9 months | 4.5 | 49.0 | 7.3 | 11.8 | 11.8 | 60.8 |
| Toddlers | 2-4 | 1.9 | 25.0 | 4.3 | 11.8 | 6.2 | 36.7 |
| Males | 4-15 | 1.4 | 17.4 | 3.6 | 8.5 | 4.9 | 25.9 |
| Females | 4-15 | 1.2 | 14.8 | 3.1 | 7.1 | 4.2 | 21.9 |
| Males | 16-29 | 0.9 | 10.5 | 3.0 | 5.7 | 3.9 | 16.2 |
| Females | 16-29 | 0.7 | 8.8 | 2.4 | 4.6 | 3.1 | 13.4 |
| Males | 30-44 | 0.9 | 9.1 | 3.2 | 5.4 | 4.1 | 14.6 |
| Females | 30-44 | 0.7 | 8.0 | 2.4 | 4.3 | 3.1 | 12.3 |
| Males | 45-59 | 0.8 | 8.5 | 2.9 | 4.9 | 3.7 | 13.3 |
| Females | 45-59 | 0.7 | 7.6 | 2.7 | 4.5 | 3.4 | 12.1 |
| Males | 60+ | 0.7 | 7.9 | 2.8 | 4.6 | 3.5 | 12.5 |
| Females | 60+ | 0.6 | 7.6 | 2.3 | 4.1 | 3.0 | 11.6 |

*Total dioxins = sum of intakes of PCDD/Fs and PCBs. Total dioxins may not equal the sum of the separate intakes due to rounding.*

Estimated mean and 95$^{th}$ percentile exposures to total dioxins decreased with age due to food consumption being greater relative to body weight for children.

The difference between the upper bound and lower bound estimates of dietary exposures results from limitations of the analytical method and the high proportion of results that were reported as less than the limit of quantitation. It should be noted that the upper bound estimate is likely to be a very conservative overestimate and the actual dietary exposure for total dioxins lies somewhere between the lower and upper bound estimates (see introductory section of Chapter 3).

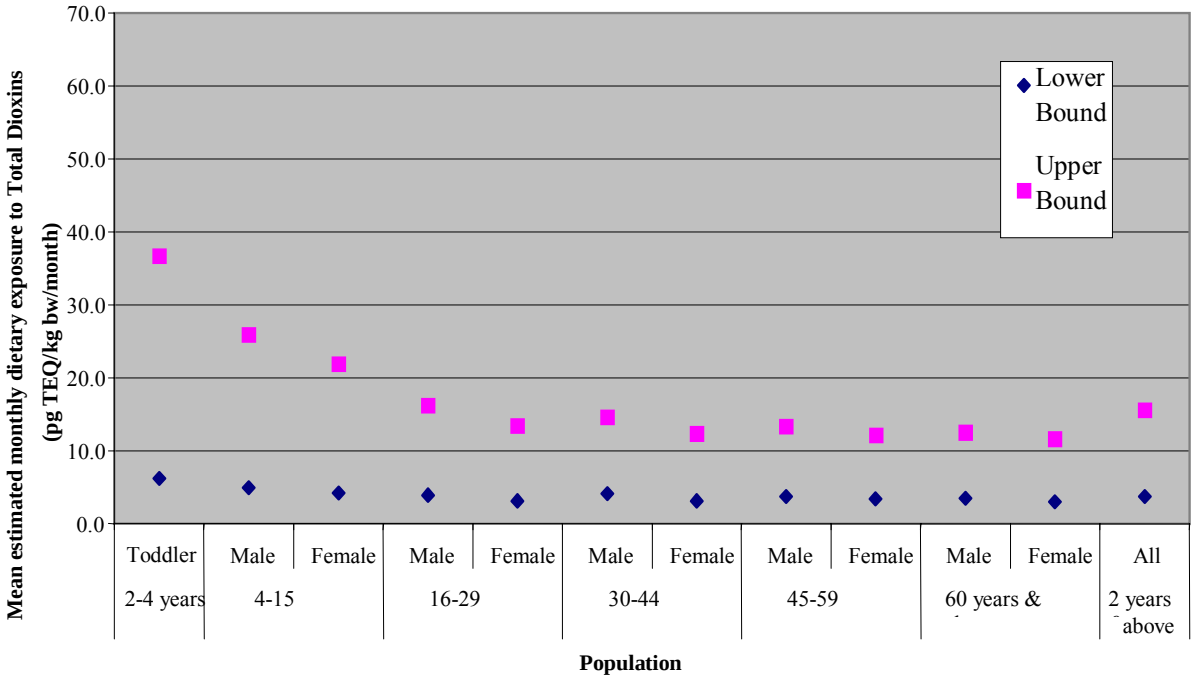

**Figure 3-10 Mean estimated monthly dietary exposure to dioxins per kilogram of body weight.**

The major contributors to both PCDD/F and PCB exposures were fish fillets (including crustaceans and molluscs) and milk products (including cheese, ice cream etc) in all age groups except infants. Figures 3-11 and 3-12 show the contribution of various food groups to PCDD/F and PCB intake respectively. As expected, in infants the major contributor to both PCDD/F and PCB exposures was infant formula, since it forms the major part of the diet in this age group.

The major foods that contributed to PCDD/Fs exposure differed slightly between adults and children, with milk being the major contributor for children (4-15 year old boys and girls and 2 –4 year old toddlers), and fish for adults (30-44, 45-59 and 60+ year old males and females). The contribution to PCDD/Fs exposure from fish and dairy products was almost equal in the 16-29 year age group.

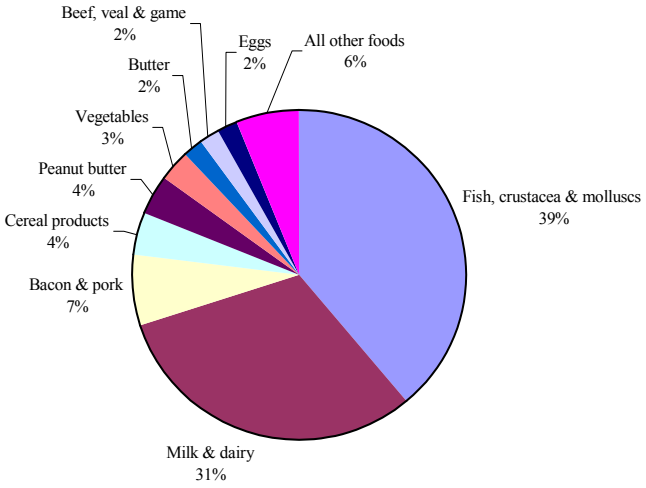

**Figure 3-11 Percent contribution of major food contributors to PCDD/F dietary exposures for the population aged 2+ years**

The major contributor to exposure to PCBs for all age groups except infants was fish fillets. Of the ten composite fish fillet samples analysed, one sample contained significantly greater amounts of PCBs. FSANZ performed additional dietary modelling using a mean value of PCBs for fish calculated excluding the one high value. In this scenario, fish remained the highest contributor to PCB exposure for adults. This may be attributed to the fact that people who consumed fish as a part of the 24-hour recall in the NNS were assumed to have consumed fish for 30 days when calculating the monthly exposures, which is unlikely because fish is not consumed every day by the majority of the population. However, milk was the highest contributor to PCB exposure for children and toddlers.

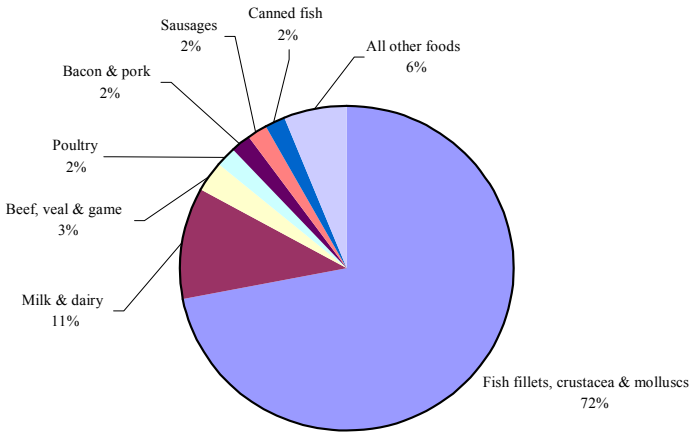

**Figure 3-12 Percent contribution of major contributors to PCBs dietary exposures for the population aged 2+ years**

The food groups that contributed to PCDD/F and PCBs dietary exposure for infants aged 9 months are shown in Appendices C and D respectively. The major contributors to PCDD/F exposure for infants were infant formula (78%), milk (from ice cream, cheese and infant desserts: all other milk consumption is assumed to be in the form of infant formula) (10%) and fish fillets (6%). Major contributors to PCBs exposure for infants were infant formula (61%) and fish fillets (26%).

### *3.2.1.3 International comparison of dietary intake of dioxins*

Direct comparison of different dietary exposure assessments conducted by different countries is problematic for a number of reasons including differences in dietary survey design, age groups surveyed, different methods of determining food consumption for the population and different methods of collecting food data. In addition there can be quite different patterns of food consumption in different areas of the world and there may be differences in calculating and reporting of TEQs. Furthermore, some data may have been collected up to a decade ago and dioxin intakes would have fallen in the last decade. Therefore, a comparison of contemporary data with older data should be done cautiously. Nonetheless, Table 3-17 gives a comparison of the mean estimated dietary exposure for adults of different countries/regions of the world for the purpose of providing some indication of the dietary exposure of the Australian population relative to that of the populations of other countries.

In general terms, the estimated intake of dioxins by Australians is comparable to that of New Zealand and lower than that of most other industrialised nations.

**Table 3-17 An international comparison of mean estimated dietary intakes of dioxins**

| Country/region | Reference | PCDD/Fs (pg WHO-TEQ/kg bw/month) | PCBs (pg WHO-TEQ/kg bw/month) | Total Dioxins (pg WHO-TEQ/kg bw/month) |

### 3.2.2 Agricultural commodities

The Australian Government Department of Agriculture, Fisheries and Forestry (DAFF) conducted a dioxin testing program through a joint arrangement between the Australian Government Department of the Environment and Heritage (DEH) and participating industry bodies.

In 2002, the National Residue Survey (NRS), managed by DAFF, arranged for the collection of approximately 220 samples from meat and fish products (DAFF, 2003). The collection of 19 milk samples was organised by the Australian Dairy Industry Corporation and a contract analytical laboratory carried out the analysis of all samples for PCDD/Fs and PCBs.

Table 3-18 shows the measured PCDD/F, PCB and total dioxins in the tested Australian agricultural commodities. Except for salmonids, there is a large difference between the lower bound and upper bound estimates. This is because only a small number of samples had detectable levels of dioxins and the assumption of non-detects being at the Limit of Detection (LOD) was by far the major contributor to the upperbound estimates. Therefore, the upper bound results are overestimates of dioxins present in the commodities.

**Table 3-18 Mean dioxin concentrations in Australian agricultural commodities**

| Commodity | PCDD/F (pg WHO-TEQ/g fat) | | | PCB (pg WHO-TEQ/g fat) | | | Total dioxins (pg WHO-TEQ/g fat) | | |
|---|---|---|---|---|---|---|---|---|---|
| | Lower bound | Medium bound | Upper bound | Lower bound | Medium bound | Upper bound | Lower bound | Medium bound | Upper bound |
| Beef | 0.104 | 0.331 | 0.557 | 0.0731 | 0.181 | 0.289 | 0.177 | 0.512 | 0.847 |
| Milk | 0.0277 | 0.231 | 0.434 | 0.028 | 0.107 | 0.186 | 0.0557 | 0.338 | 0.620 |
| Pigs | 0.0029 | 0.167 | 0.331 | 0.0106 | 0.127 | 0.244 | 0.0212 | 0.294 | 0.575 |
| Poultry | 0.0012 | 0.166 | 0.330 | 0.0173 | 0.133 | 0.249 | 0.0184 | 0.299 | 0.579 |
| Sheep | 0.112 | 0.342 | 0.572 | 0.0346 | 0.133 | 0.231 | 0.147 | 0.475 | 0.803 |
| | PCDD/F (pg WHO-TEQ/g fresh weight) | | | PCB (pg WHO-TEQ/g fresh weight) | | | Total dioxins (pg WHO-TEQ/g fresh weight) | | |
| Salmonids[1] | 0.173 | 0.201 | 0.228 | 0.398 | 0.500 | 0.602 | 0.571 | 0.701 | 0.830 |

[1]-aquacultured

Despite the inconsistency of methods and sampling of international dioxin data, it is useful to compare Australian data to international findings and international standards. A comparison was made between data generated in this study and the dioxin data for geographical regions in the recent Codex Commission on Food Additives and Contaminants (CCFAC) position paper (Codex Alimentarius Commission, 2003). It is important to note that these results are not directly comparable and the testing conducted for the Australian study includes more species and more compounds (i.e. PCDD/F, PCBs and Total WHO-TEQ) than data presented in the CCFAC paper. Therefore, several species/compound comparisons are not possible. Those that are possible are included Appendix XV and are presented as upperbound ranges of dioxins in the various species. In most cases the maximum PCDD/F and PCB concentrations in all Australian agricultural commodities was lower than that of other regions of the world.

In addition, the results of the current study were compared to the EU standard for PCDD/Fs in agricultural commodities. Table 3-19 shows that both the mean and the maximum values for all of the tested Australian commodities were below the EU standard.

**Table 3-19 A comparison of PCDD/Fs in Australian agricultural commodities with the EU Standard for PCDD/Fs**

| Species | EU standard Maximum pg WHO-TEQ /g * | Mean** result from this study | Maximum** result from this study |
|---|---|---|---|
| Beef | 3 | 0.557 (18.6%) | 1.77 (59.0%) |
| Fish (salmonids) | 4 | 0.228 (5.7%) | 0.350 (8.75%) |
| Milk | 3 | 0.434 (14.5%) | 0.749 (25.0%) |
| Pig | 1 | 0.331 (33.1%) | 0.551 (55.1%) |
| Poultry | 2 | 0.330 (16.5%) | 0.529 (26.45%) |
| Sheep | 3 | 0.572 (19.1%) | 2.83 (94.3%) |

* on a fat basis except for fish which is on a muscle basis. Where a congener is not detected, the EU standard assumes the LOD for that congener.

** mean and maximum results are upperbound concentrations expressed as pg WHO-TEQ/g. Values in parentheses are expressed as a percentage of the EU standard for that species).

Since "table ready" food products derived from the agricultural commodities sampled in this study were also included in the dietary survey and dietary modelling conducted by FSANZ, the potential human health risks of dioxin contaminated agricultural commodities will not be further discussed in this section. Section 3.2.1 contains details of the Australian population's estimated dietary exposure to dioxins.

### 3.2.3 Intake from human milk

Section 3.2.1 includes the estimated dioxin intake for infants (9-months old) fed 50% of their energy requirements from infant formula and 50% from solids and gives measured concentrations of dioxins in infant formula sampled in Australia. Section 3.1.2 outlines the results of a study by Müller et al (2003a) which investigated the current levels of dioxins in the breast milk of Australian mothers. Using the results of these analyses and the measured concentrations of dioxins in infant formula, the intake of dioxins by breast-fed and non-breast fed infants can be estimated.

In order to assess the dietary exposure to dioxins for infants at three months of age that are fully breast-fed, the quantity of breast milk consumed needed to be determined. Butte et al (2002) found that infants at 3 months of age from presumably well-nourished populations, including Australia, consumed a mean amount of 750 g of breast milk per day (weighted for sample size). The median ($50^{th}$ percentile) weight for a male infant at three months is 6 kg (WHO, 1983). Boys' weights were used because boys tend to be heavier than girls at the same age and therefore have higher energy and food requirements. Therefore, using these figures, and multiplying by 30 to provide a monthly consumption, a fully breast fed infant at three months of age consumes 3800 g breast milk/kg bw/month. The mean concentrations of dioxins in breast milk used for this dietary exposure assessment were taken from the recent study of Müller et al (2003a).

As there were no food consumption data available from the NNS on children under two years, a diet was constructed to enable dietary exposure to dioxins for infants at nine months of age to be calculated. Details of the constructed diet for infants at 9 months are available in Section 3.2.1. In this constructed diet, milk was assumed to provide half of the infant's energy requirements. In order to determine the dietary exposure to dioxins for breast fed infants at 9 months, this same constructed diet was used, and all milk consumption was assumed to be breast milk. All other assumptions relating to the construction of the diet remained the same. As for infants at 3 months, the dioxin concentrations for breast milk used for calculating dioxin exposure for infants at 9 months were taken from Müller et al (2003a). As milk was assumed to only provide 50% of the energy requirements of an infant at 9 months, dioxin concentrations for all other foods, making up the other 50% of energy requirements were derived from the FSANZ dioxin total diet survey, which is outlined in Section 3.2.1.

The aim of the dietary exposure assessment was to make as realistic an estimate of dietary exposure to dioxins as possible. However, where significant uncertainties in the data existed, conservative assumptions were generally used to ensure that the dietary exposure assessment did not underestimate exposure.

For breast fed infants, the following assumptions were made:

- milk was the only food consumed for infants at 3 months;
- all milk consumed was breast milk for infants at 3 and 9 months;
- the dioxin concentration of breast milk for infants at 2-8 weeks is the dioxin concentration of breast milk for the whole term of breast-feeding each infant;
- the dioxin concentration for breast milk was the same for all infants, irrespective of the number of breast-fed siblings; and
- one gram of breast milk is equal to one millilitre of breast milk.

Table 3-20 gives the estimated lower and upper bound mean intakes of PCDD/Fs, PCBs and total dioxins for breast-fed and non-breast-fed Australian infants at 3 and 9 months of age.

**Table 3-20 Estimated monthly intake of dioxin for Australian breast-fed and non-breast-fed infants**

| Compound | Bound | Estimated intake (pg WHO-TEQ/kg bw/month) | | | |
|---|---|---|---|---|---|
| | | Breast-fed | | Non-breast-fed | |
| | | 3 months | 9 months | 3 months | 9 months |
| **PCDD/F** | Lower | 807 | 490 | 5.9 | 4.4 |
| | Upper | 831 | 518 | 54.1 | 49.0 |
| **PCB** | Lower | 427 | 261 | 6.9 | 7.3 |
| | Upper | 427 | 264 | 9.7 | 11.8 |
| **Total dioxins** | Lower | 1234 | 751 | 12.8 | 11.8 |
| | Upper | 1258 | 782 | 63.9 | 60.8 |

As is the case with other aspects of this exposure assessment, comparison of different estimates of dioxin intake as a result of breast feeding is difficult because factors such as the sampling of breast milk, assumed intake of breast milk, infant age and percent of diet assumed to be from breast milk will differ between studies. Compared with intake estimates for breast-fed infants from other countries, the intake estimates for Australian infants were the lowest amongst those countries for which data were readily available (see Figure 3-13 for an international comparison of intake estimates for breast-fed infants). Smith and Lopipero (2001) estimated intake of total dioxins for New Zealand infants breast-fed for periods up to 12 months and calculated an average intake of between 37 and 52 pg WHO-TEQ/kg bw/day (equal to 1110-1560 pg WHO-TEQ/kg bw/month). Dioxin intakes for breast-fed Dutch infants (age not specified) were estimated by Liem and Rappe (1998) to be 115 pg WHO-TEQ/kg bw/day (equal to 3450 pg WHO-TEQ/kg bw/month). The estimate of Liem and Rappe (1998) was very similar to the 112-118 pg WHO-TEQ/kg bw/day (3360-3540 pg WHO-TEQ/kg bw/month) intake estimate of Patandin et al (1999b) for Dutch infants fed breast milk for 6 months. Estimated lower bound total dioxin intake of 76 pg WHO-TEQ/kg bw/day (2280 pg WHO-TEQ/kg bw/month) for Belgian infants that were breast-fed (Focant et al, 2002) was similar to that of Dutch infants. Two estimates of total dioxin intakes from breast milk by Korean infants were 60 and 85 pg WHO-TEQ/kg bw/day (1800 and 2550 pg WHO-TEQ/kg bw/month) (Yang J et al, 2002; Yang Y-H et al, 2002). The US EPA

(2000) estimated an average total dioxin intake of 92 pg WHO-TEQ/kg bw/day (2760 pg WHO-TEQ/kg bw/month) by US infants breast-fed for 12 months.

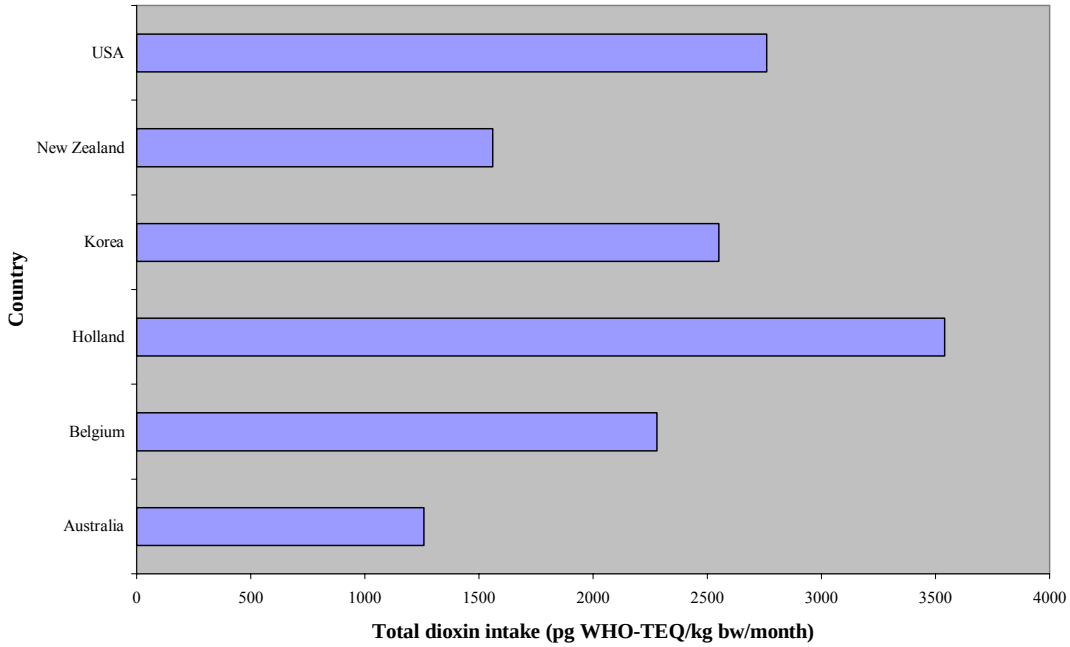

**Figure 3-13 An international comparison of estimated dioxin intakes for breast-fed infants**

[Maximum reported intakes (as given in above text) for solely breast-fed infants from each country. Australian value is upper bound estimate at 3-months.]

The estimated intake of dioxins during breast feeding of Australian infants was considerably higher than estimated dietary intakes of dioxins for the rest of the Australian population (3.7-15.6 pg WHO-TEQ/kg bw/month; see Section 3.2.1). Similar differences between the dioxin intake of breast-fed infants and the rest of the general population were also reported for the Dutch (Liem & Rappe, 1998), New Zealand (Smith & Lopipero, 2001) and the US populations (US EPA, 2000).

Estimated dietary exposure to dioxins for infants at 9 months is much less than for infants at 3 months as approximately half the energy requirements of a 9-month old infant are derived from foods other than breast milk, that have significantly lower dioxin concentrations. Exposure to dioxins from breast milk occurs for a very short time in a person's life. As the 1995 National Health Survey (NHS) did not survey children under the age of two, it is difficult to obtain data on the consumption of infant formula in Australia. However, a report based on the results of the NNS on the introduction of breast milk substitutes and solid foods to Australian children between 1992 and 1995 revealed that by the age of 26 weeks, the majority of children had been given infant formula (56.9%) (Donath & Amir, 2002).

The pattern of infant feeding at four weeks, 12 weeks and 24 weeks of life, using a sub-sample of children aged over six months, is shown in Table 3-21.

**Table 3-21 Patterns of feeding for the first six months of a child's life**

| | At 4 weeks | At 12 weeks | At 24 weeks |
|---|---|---|---|
| Breast milk only | 70.3% | 57.8% | 17.5% |
| Infant formula[a] only | 25.1% | 32.2% | 15.8% |
| Breast milk and infant formula[a] | 2.7% | 3.1% | 2.2% |
| Breast milk and solid food | 0.7% | 2.7% | 23.3% |
| Infant formula[a] and solid food | 1.0% | 4.2% | 36.2% |
| Breast milk, infant formula[a] and solid food | 0.0% | 0.1% | 3.2% |

[a] Includes milk substitutes other than infant formula

from Donath and Amir, 2002.

In addition to changes in the infant diet that reduce the intake of dioxins as an infant grows, the intake of dioxins by growing infants may also be reduced by changes in the dioxin concentration of breast milk. The estimates of intake given in Table 3-20 assume that dioxin concentrations in breast milk are constant over the nursing period. However, the dioxin concentration in maternal milk has been observed to decrease during lactation (Lakind, 2000; Fürst 1989). The modelling studies of the US EPA (2000) and Lorber and Phillips (2002) took into account the reduction in breast milk concentrations during lactation and predicted a decrease in infant intakes of dioxins during lactation (without accounting for any dietary changes). Therefore, the intake estimate given in Table 3-20 for 9-month old infants is likely to be an overestimate.

The dioxin intakes of breast-fed Australian infants were also considerably higher than those of non-breast-fed infants. This difference is due to the lower dioxin concentrations in infant formula, largely as a result of infant formulas containing vegetable fats rather than animal milk fats. Patandin et al (1999b) reported a similar difference with the mean daily dioxin intake per kilogram bodyweight for breast-fed Dutch infants being 50 times higher than that of non-breast-fed infants.

Although the intake of dioxins by breast-fed infants is considerably higher than the estimated adult and non-breast-fed infant intakes, the impact of breast feeding on the body burden in infants is likely to be lower. This can be attributed to the rapidly increasing body weight and lipid volume of the growing infant and the higher rate of dioxin excretion in infants compared with adults (see discussion below on body burden modelling). In the study of Kreuzer et al (1997) the difference in body burden between breast-fed and non-breast-fed infants was less than an order of magnitude and similarly, the study by the US EPA (2000) showed a difference in body burden between breast-fed and non-breast-fed infants of only two times at one year of age.

Several modelling studies have been conducted to investigate the impact of dioxin intake from breast feeding on body burdens of infants and the lifetime intake in adults (Kreuzer et al, 1997; Pantandin et al, 1999; Lorber & Phillips, 2002; US EPA, 2000). Although breast-fed infants were shown to have higher body burdens of dioxins during nursing, the body burden of breast-fed and non-breast-fed children was predicted to be similar after several years and to remain similar for the rest of life. The study by

Kreuzer et al (1997) is discussed below to examine the predicted impacts of dioxin intakes by infants on body burden over a lifetime.

Using data from their own study and other values reported in the literature, the authors have modelled TCDD levels in adipose tissue over a lifetime, in breast-fed (6 months) and non-breast-fed subjects. Figure 3-14 shows the time-course of the predicted concentrations of TCDD in lipids of adipose tissue or blood of a male subject from birth to 60 years of age. Note that this model is for TCDD only since to model related compounds would require consideration of different rates of bioaccumulation and biotransformation, and different rates and extent of protein binding. There is evidence that trans-placental transport from the mother to the fetus is close to 100%, leading to the treatment of the whole organism (mother/fetus) as a one-compartment model. Thus, based on a simulated initial maternal TCDD concentration of 2.23 ng/kg lipid), the TCDD concentration in the body of the newborn at the time of delivery was also taken to be the same, viz. 2.23 ng/kg lipid, a value also taken to be the level in breast milk.

For elimination of TCDD, the model takes into account excretion of TCDD in faecal lipids as well as its metabolic transformation. With respect to faecal excretion, data suggest that the faecal TCDD concentration reflects its concentration in lipids of the organism. The half-life of faecal elimination is proportion to the ratio of the volume of body lipids to the mass of lipids in faeces excreted per unit time; since the volume of body lipids increases at least 40 times during ageing but the mass of lipids in faeces excreted per unit time increases only about 1.7-times, the calculated half-life of faecal elimination changes considerably with age, from only ca. 0.42 years in newborns to ca. 9.5 years in 40-year old adults. The half-life of metabolic elimination is proportional to the total volume of body lipids and inversely proportional to liver surface area. Calculated half-lives for metabolic elimination were 1.5 years for newborns and about 10 years at age 40. However, according to the model, most TCDD is eliminated unchanged in the faeces during childhood and youth, whilst metabolic removal becomes more important with age. (With respect to increasing elimination half-life with age, it may be noted that the decline in TCDD levels in adipose tissue of young rhesus monkeys (0.3 - 2 years) revealed a mean half-life of ca. 180 days cf. 391 days in adults (Bowman et al, 1989b; 1990).

The upper curve of Figure 3-14 was computed assuming breast feeding for the first 6 months of life, followed by formula up to one year of age. The lower curve considers intake of only feeding formula for the same time period. For both scenarios, further nutrition was simulated to consist of common diet. The curves predicted for both feeding conditions differ considerably during the first years of life. Over the first year, predicted TCDD concentrations decrease for a non breast-fed subject, subsequently increasing to a maximum at ca. 16 years. The initial decrease reflects less uptake of TCDD from formula than during pregnancy when the foetus was in equilibrium with the mother's body burden.

For breast-fed infants, the simulation yields a rapid increase of TCDD in body lipids due to TCDD uptake from mother's milk. After weaning, the concentrations decrease during the following 3 or so years and the curves merge at about the age of 7 years. [Kreuzer et al (1997) noted that simulated TCDD levels in breast fed infants did not

exceed actual measurements of lipid TCDD levels in adults, which show a wide spread of values in different samples.]

Thus the model for TCDD levels in body lipids demonstrates that even relatively high concentrations of TCDD which may be reached after 6 months of breast feeding do not lead to a raised lifetime body burden. This is a reflection of the fact that the half-life due to metabolic transformation and faecal elimination is considerably shorter in infants than in older subjects. In addition, there is dilution of concentration by growth in body mass and the significant increase in total body fat volume.

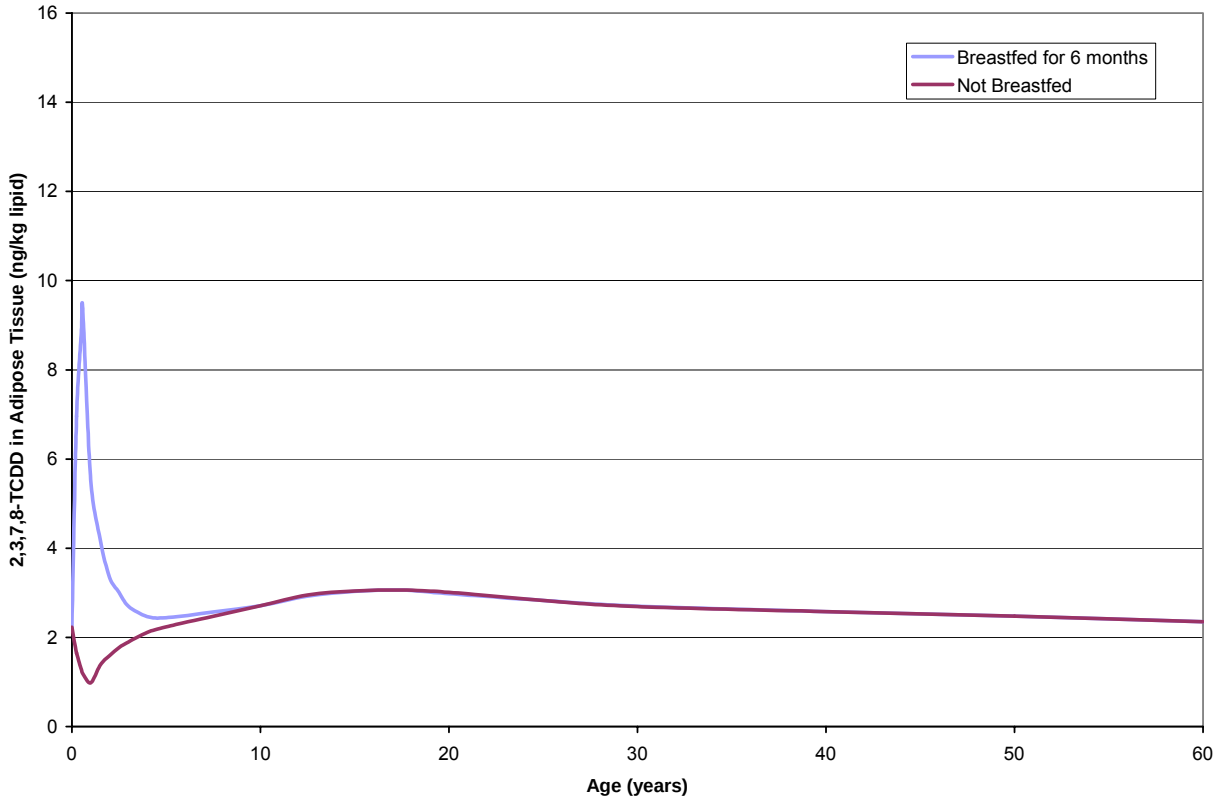

**Figure 3-14 TCDD concentrations in lipid tissue of breast-fed and non-breast-fed infants**

## 3.3 Intake from Air

The generation of dioxins results predominantly from combustion processes and atmospheric transport represents the primary route for transport of dioxins into the environment. A review of sources of dioxins in Australia (Pacific Air and Environment Pty Ltd, 2002b) identified a range of possible sources including bushfires and prescribed burning, residential wood combustion and industrial processes. This review was updated recently using United Nations Environment programme standardised protocols for estimating dioxin emissions to air, water and land. In this update, uncontrolled combustion processes which include biomass burning such as forest,

grassland and harvest residue fires and waste burning and accidental domestic/industrial fires were shown to represent the largest single category contributor to dioxins in air (Bawden et al., 2004).

In this section, discussion of dioxin contributions from motor vehicles is based on data from an Environment Australia report commissioned to assess dioxins emissions from motor vehicles (Pacific Air and Environment Pty Ltd, 2002a). Comment on the contribution of bushfires to dioxin air levels is made predominantly from a report on dioxin release from bushfires, commissioned by DEH (Meyer & Beer, 2004). Similarly, comment on the contribution of wood heaters to dioxin air levels in Australia is made from two technical reports on the use of firewood and solid fuel burning appliances also commissioned by DEH (Gras, 2002; Todd, 2002).

As well as commenting on main sources of air dioxins, this section provides a dioxin inhalation exposure assessment for different population subgroups based on data from a project, which determined ambient air levels of dioxins in Australia. The Australian dioxin ambient air level study (Gras & Müller, 2003) measured dioxin levels in urban, rural and remote airsheds. Based on these data, estimated daily inhalational exposures to dioxins were calculated for 5 separate Australian population subgroups - newborn, infant (one year), child (10 years), adult woman and adult man. Daily inhalation exposures per kg body weight were based on data for inhalation rates and body weights from the draft Australian Exposure Assessment Handbook (EnHealth, 2003).

### 3.3.1 Ambient air

Data on dioxins in ambient air were provided by the DEH ambient air project (Gras & Müller, 2003) which sampled air from a total of 10 sites representing three different airsheds:

1. Urban (residential, light and heavy industrial areas in State capital city sites and large regional centres), consisting of:
    - Kwinana, Perth, WA (industrial);
    - Duncraig, Perth, WA (mid-sized urban);
    - Darwin, NT (small urban within a remote rural region);
    - Eagle Farm, south-east Qld (light industrial);
    - Westmead, Sydney, NSW (major urban, some light industry impact from mixed industrial/urban air shed);
    - Alphington, Melbourne, Vic (major urban area, Yarra Valley);
    - Netley, Adelaide, SA (light industrial).

2. Rural (grazing, cropping and intensive horticulture areas) consisting of:
    - Mutdapilly, south-east Qld (agricultural/grazing)
    - Boorolite, lower north-east Vic (agricultural/grazing), and

3. Remote Reference Area
    - Cape Grim, Tasmania

Sampling was usually conducted monthly over a 12-month period to establish possible seasonal variations in dioxin concentration related to emissions from sources such as wood heaters and bushfires. At two sites (Mutdapilly and Netley), the sampling period was 12 months, collected at intervals of two months.

Samples were collected using high volume samplers designed to collect both gas and particle-phase dioxins. Subsequent extractions and analyses for a total of 29 dioxin and dioxin-like congeners and homologues were conducted at the Australian Government Analytical Laboratories, Sydney.

Data for each of the three air sheds were averaged over the year and combined as WHO-TEQs for PCDD/Fs, PCBs or total dioxins. Lower bound, middle bound and upper bound limits were determined by differing treatment of dioxin concentrations below the limit of detection (LOD), set at three times the sample blank noise standard deviation (0.6 fg WHO-$TEQ_{DF}/m^3$). For lower bound limits, values below the LOD were assumed to be zero. For middle bound limits, values below the LOD were assumed to be half the LOD. Upper bound limits were calculated by assuming values below the LOD were equal to the LOD.

Summarised air data from the DEH ambient air project are depicted in Appendix XVI. Across all three airsheds, PCDD/Fs were present in much higher concentrations than PCBs. As expected, urban airsheds showed the highest levels of dioxins (total dioxins, mean lower and upper bound limits 13.61 – 14.37 fg WHO-TEQ/$m^3$). Total dioxin levels were approximately five to six times higher than those for rural airsheds (mean lower and upper bound limits 1.94 – 2.82 fg WHO-TEQ/$m^3$) and an order of magnitude higher than those for the remote reference site (mean lower and upper bound limits 0.73 – 1.47 fg WHO-TEQ/$m^3$).

Comparisons to levels reported overseas show that Australian ambient air concentrations are relatively low. Mean concentrations of PCDD/Fs for rural sites are 1.52 – 2.35 fg WHO-TEQ/$m^3$ (lower and upper bound limit), lower than the mean of 3.77 fg I-TEQ/$m^3$ for the lowest reported New Zealand rural site (Buckland et al, 1999), and much lower than the 12 fg I-TEQ/$m^3$ reported for rural locations in the USA (Cleverly et al, 2000).

Similarly, mean concentrations of dioxins for Australian urban sites are 11.8-12.50 fg WHO-TEQ/$m^3$ (lower and upper bound limit), comparable to New Zealand rural locations (4 – 16 fg I-TEQ/$m^3$) (Buckland et al, 1999) and lower than many urban sites across Europe (for detail, see Gras & Müller, 2003).

***Inhalation Exposure Assessment***

Inhalation exposures for five population subgroups were calculated using exposure factor data from the draft Australian Exposure Assessment Handbook (AEAH). Body weights for adult women and adult men were taken as those for individuals 25-44 years of age. The weight for a child (10 years) was the average of values given for male and female children. For infants and newborn for which data are lacking in the draft AEAH, infant weights (1 year) were assumed to be half the average weight for 2-3 year old

males and females. Newborn weights were assumed to be half the weight of infants (3.8 kg).

**Table 3-22 Inhalation rates and body weights of population subgroups**

| | Inhalation Rate ($m^3$/day) | Body Weight (kg) |
|---|---|---|
| **Newborn**[+] | 0.8 | 3.8 |
| **Infant (1 year)**[#] | 3.8 | 7.7 |
| **Child (10 years)** | 15.0 | 35.7 |
| **Adult Woman**[*] | 21.0 | 67.3 |
| **Adult Man**[*] | 23.0 | 82.4 |

+ assumed to be one-half the body weight of infants
# assumed to be one-half the body weight of 2-3 year olds
* 25-44 years of age

There is a paucity of data on human absorption of dioxins from inhalation exposure. ATSDR (2000) notes the study of Wolff (1985) examining capacitor workers exposed to PCBs. This study claims the inhalation route as responsible for up to 80% of the absorbed PCB levels in adipose tissue.

In rats, at least 95% of a single dose of 2,3,7,8- tetrachlorodibenzo-p-dioxin (TCDD) was reported to be absorbed following intratracheal application. In this study, pulmonary absorption was greater than oral absorption (Diliberto et al, 1996). In a single human volunteer, > 87% absorption was reported following a single oral dose of 2,3,7,8-TCDD (Poiger & Schlatter, 1986). Notwithstanding species differences, taken together, these data would suggest extensive absorption of dioxins via the inhalation route in humans.

Differences in absorption are expected between dioxins in the gaseous (vapour) dissolved liquid and solid (particulate) states. On the basis of animal data and information on the fate of particles in the respiratory system, the US EPA estimated that the fraction of 2,3,7,8-TCDD absorbed into the human body from inhalation of soil particles ranges from 0.25-0.29 (US EPA, 1984b).

The ambient air data from the DEH Ambient Air Project do not distinguish between gaseous and particulate dioxins. Overall, therefore, in the absence of detailed information on pulmonary deposition and absorption of dioxins of different material states and of the different congeners and homologues in humans, this exposure assessment assumes 100% pulmonary deposition and absorption for all dioxin species. This assumption is in line with policy of the US Department of Health and Human Services (DHHS) which, in the absence of bioavailability information, assumes 100% bioavailability for health effects evaluations (DHHS, 2002).

Inhalation exposures to dioxins were estimated using urban and rural ambient airshed data. Lower and upper bound exposure estimates were calculated according to the following formula using lower and upper bound mean ambient air dioxin concentrations (Gras & Müller, 2003) and standard values for air intakes and body weights from the Australian Exposure Assessment Handbook:

Estimated Daily Dioxin Intake (fg WHO-TEQ/kg bw/day**)** =

[dioxin ambient air concentration (fg/$m^3$) x daily inhalation rate ($m^3$/day)]/ body weight (kg)

Inhalation exposure estimates using urban and rural airshed data are depicted in Tables 3-23 and 3-24.

**Table 3-23 Mean estimated monthly inhalation exposure to dioxins (pg WHO-TEQ/kg bw/day) - Urban airshed**

| | PCDD/Fs | | PCBs | | Total Dioxins | |
|---|---|---|---|---|---|---|
| | Lower Bound | Upper Bound | Lower Bound | Upper Bound | Lower Bound | Upper Bound |
| **Newborn** | 0.074 | 0.079 | 0.012 | 0.012 | 0.086 | 0.091 |
| **Infant (1 year)** | 0.174 | 0.185 | 0.027 | 0.028 | 0.202 | 0.213 |
| **Child (10 years)** | 0.148 | 0.157 | 0.023 | 0.024 | 0.172 | 0.181 |
| **Adult Woman** | 0.110 | 0.117 | 0.017 | 0.018 | 0.127 | 0.134 |
| **Adult Man** | 0.098 | 0.105 | 0.015 | 0.016 | 0.114 | 0.120 |

**Table 3-24 Mean estimated monthly inhalation exposure to dioxins (pg WHO-TEQ/kg bw/month) - Rural airshed**

| | PCDD/Fs | | PCBs | | Total Dioxins | |
|---|---|---|---|---|---|---|
| | Lower Bound | Upper Bound | Lower Bound | Upper Bound | Lower Bound | Upper Bound |
| **Newborn** | 0.010 | 0.015 | 0.003 | 0.003 | 0.012 | 0.018 |
| **Infant (1 year)** | 0.022 | 0.035 | 0.006 | 0.007 | 0.029 | 0.042 |
| **Child (10 years)** | 0.019 | 0.030 | 0.005 | 0.006 | 0.024 | 0.035 |
| **Adult Woman** | 0.014 | 0.022 | 0.004 | 0.004 | 0.018 | 0.026 |
| **Adult Man** | 0.013 | 0.019 | 0.004 | 0.004 | 0.016 | 0.024 |

As expected, given significant anthropogenic sources of dioxins such as fossil fuel combustion, inhalation exposure to dioxins is approximately 5-6 times higher in the urban compared to the rural environment.

Amongst the 5 population subgroups assessed, dioxin intake per kg body weight per day was highest for infants and children. The values for infant appear slightly higher than those for child, but are dependent on the assumption of body weight in the absence of weight information for infants in the AEAH. Weight data for adult men and women were available in the AEAH and the calculated dioxin intake for women was slightly greater than that for men. This reflects the fact that women have a significantly lower average body weight than men although the volume of air they breathe per day is only slightly smaller.

For the lower measured levels of dioxins in rural and remote region air compared to urban air, assumptions regarding measurements below the LOD have a greater relative

impact. As a percentage of absolute mass estimates, differences between lower and upper bound values are much greater for rural compared to the urban environments because measured levels are closer to the LOD.

### 3.3.2 Motor vehicles

Dioxins are formed by combustion processes. In a study commissioned to determine sources of dioxins in Australia, Bawden et al (2004) noted that anthropogenic sources, particularly industrial combustion processes, are significant contributors to environmental dioxin levels.

In the light of dioxin generation from vehicles, Environment Australia commissioned a study to estimate the total contribution to environmental dioxins from motor vehicle use in Australia. In this study, a survey of international dioxin inventories identified emissions from motor vehicles as important sources (Pacific Air and Environment Pty Ltd, 2002a).

Although it is recognised that dioxins are formed during combustion, the mechanisms of formation are poorly or incompletely understood. Production processes in which chlorine and a carbon source are present at temperatures greater than 200°C are potential dioxin sources. Although no specific data on dioxin formation within vehicle engines or exhausts were found (Pacific Air and Environment Pty Ltd, 2002a), the general formation mechanisms that are known to apply during combustion are assumed to apply to internal combustion engines. For example, studies show particular dioxin formation in the cooler zones of waste incinerator systems where catalytic surfaces, excess oxygen, organic matter and appropriate temperatures (approximately 300°C) are present. These conditions are assumed analogous to environmental conditions in exhaust systems of diesel and petrol engines (Bacher et al., 1991; Jones, 1993). Also, whereas high temperatures and long residence times in furnaces lead to complete combustion and lower dioxin emissions, the incomplete combustion in internal combustion engines, as suggested by low efficiency and significant emissions of incomplete combustion products such as hydrocarbons and carbon monoxide, indicates a potential for dioxin formation.

In the absence of Australian data, Pacific Air and Environment Pty Ltd (2002a) presents data from international studies of vehicle dioxins emissions for different vehicle classes. Most data were in the form of fuel-based emission factors (as pg/L fuel). In order to estimate total dioxin emissions, fuel-based emission factors were combined with Australian fuel economy data for varying vehicle types to account for differences in fuel economy between countries, and then combined with use (kilometres travelled) data for different vehicle types from the Australian Bureau of Statistics (ABS) and the National Environment Protection Council. Alternatively, the fuel-based emission factors were combined with total fuel consumption data for each vehicle type from the ABS to derive total dioxin emissions. Lastly, as a worst case estimate which includes off-road traffic and non-road traffic dioxin emissions, emission factors were combined with total fuel use statistics from the Department of Industry, Tourism and Resources (DoITR) (Table 3-25).

**Table 3-25 Dioxin emissions estimates using different vehicle use/fuel datasets**

| Data Source | Total Dioxins Emissions (g I-TEQ/year) |
|---|---|
| Vehicle fuel economy/activity data (ABS) | 0.7-16.5 |
| Vehicle total fuel consumption data (ABS) | 0.6-17.3 |
| Total fuel use statistics (DoITR) | 0.7-24.3 |

From Pacific Air and Environment Pty Ltd, 2002a.

On the basis of Australian fuel economy and activity (kilometres) data, total dioxin emissions from Australian road traffic were estimated at 0.7-16.5 g I-TEQ per year. On the basis of total individual vehicle type fuel consumption data, total dioxin emissions from Australian road traffic were estimated at 0.6-17.3 g I-TEQ per year. On the basis of total fuel use statistics, (which then includes off-road traffic and non-road traffic emissions), worst case estimates of 0.7-24.3 g I-TEQ per year were obtained.

Using a current inventory estimate of total dioxin air emissions in Australia of 500 g WHO-TEQ per annum (Pacific Air and Environment Pty Ltd, 2002b) the above figures represent a contribution from vehicle use of 0.12-4.9% of total dioxin emissions to air.

These estimates are accompanied by significant uncertainties. Unfortunately, there is a lack of measured data internationally on dioxin emissions from road traffic. Despite the variety and number of vehicles currently in operation worldwide, relatively few test data on dioxin emissions are available. Studies generally only consider small numbers of vehicles with estimates sensitive to factors such as driving conditions, fuel quality and ambient temperatures. Overall, assumptions only allowed the estimation of emission factors ranges and not average emission factors (Pacific Air and Environment Pty Ltd, 2002a).

### 3.3.3 Bushfires

The generation of dioxins *via* combustion processes and the high frequency of bushfires, prescribed fires and agricultural waste burning suggest these events as noteworthy sources of dioxins discharged to air in Australia (Pacific Air and Environment Pty Ltd, 2002b). Although measured data on emissions from small scale controlled burns are available (eg. woodheaters), the complexity of dioxin chemistry precludes the extrapolation of data from such studies to the characterisation of combustion processes in the field. Therefore, on the basis of a lack of measured data on emissions from bushfires, prescribed fires and agricultural waste burning in Australia, a study was commissioned to determine the emissions of dioxins from field fires (Meyer & Beer, 2004).

Dioxin emissions were measured from 21 field burns and 19 laboratory burns designed to replicate combustion processes of open fires. Field burns comprised 13 fuel reduction fires, 2 cane burns, 4 fires in tropical savannah woodlands and 2 wildfires. Cereal straw, native sorghum, sugar cane trash and forest leaf litter were subject to laboratory burns in a dedicated test corridor at the CSIRO fire testing laboratory. As well as dioxin emissions, total suspended particulate matter and carbon dioxide concentrations were measured so that emission factors relating dioxin concentrations to combusted fuel masses (expressed per gram of carbon) could be derived.

For field burns, mean emission rates for total dioxins were calculated for fuel reduction fires, savannah fires, sugar cane fires and wildfires were 1.8, 2.3, 2.1 and 1.0 pg WHO-TEQ/g carbon respectively.

In contrast, most emission rates measured in laboratory burns were much higher than field burns. Mean emission rates for straw, sorghum and sugar cane were 33, 69 and 9.8 pg WHO-TEQ/g carbon respectively. However, emission rates from laboratory leaf litter burns were much lower with a mean of 1.7 pg WHO-TEQ/g carbon. These emission factors incorporate middle bound estimates where values below the limit of detection (LOD) were assumed to be half the LOD.

Congener profiles observed in laboratory burns were different to those observed in field burns, but consistent with emissions measured from wood combustion in domestic heaters. Overall, laboratory burns produced a wide range of PCDD/F congeners with lower chlorinated species most abundant. Furans were substantially more abundant than dioxins. In contrast, field burns produced predominantly dioxins with higher chlorinated species most abundant.

The contrast between emissions measured in the laboratory and in the field were thought to arise from differences in the durations at which smoke plumes remain at high temperatures necessary for heterogeneous dioxin synthesis. In laboratory tests, as in domestic heating appliances, gases and particulates are thought to be retained in the combustion space in a temperature environment above 200°C which is optimal for dioxin synthesis. In contrast, in field burns, air entrained in the smoke plume rapidly cools below this temperature and thus extensive dioxin synthesis is prevented. These observations preclude laboratory tests as appropriate surrogates for emissions testing in the field (Meyer & Beer, 2004).

Emission rates derived from field measurements were combined with National Greenhouse Gas Inventory (NGGI) algorithm and activity data to derive total emissions of dioxins/furans and PCBs from different types of field fires. Using NGGI data, total emissions of PCDD/Fs and PCBs from agricultural, forest and savannah fires were estimated at 152 g WHO-TEQ/year for 1994 and 233 g WHO-TEQ/year for 2001. The increase was due to increased fire activity (Meyer & Beer, 2004).

Using a current estimate of total dioxin air emissions in Australia of 500 g WHO-TEQ per annum (Bawden et al, 2004), the comparable emissions figure for 2001 represents a best estimate contribution from field fires of 47% of total dioxin emissions to air.

### 3.3.4 Wood heaters

Studies of atmospheric fine particulates in Australian cities suggest that residential wood combustion for heating is a major source of winter aerosol mass (Gras & Müller, 2003).

One of the findings of a recent Australian dioxin ambient air level study (Gras & Müller, 2003) was a strong seasonal cycle in dioxin concentrations both as mass concentrations and TEQ. A winter concentration maximum was measured for all major

population centres studied. Moreover, the period of enhanced concentrations was shorter in northern locations compared to southern locations. This seasonal variation in dioxin levels and correlation with aerosol non-sea-salt potassium as a tracer for biomass burning indicate residential wood smoke as the source of winter increases (Gras & Müller, 2003). The particular seasonal patterns of dioxin congeners and homologues show strong correlation to patterns found in studies of wood smoke emissions from residential wood heaters in New Zealand (Buckland et al, 1999) and more recently in Australia (Gras, 2002; Gras & Müller, 2003).

Residential combustion (furnaces, stoves, fireplaces) was identified as a potential source of air dioxins also in a source survey of dioxin air emissions in Australia (Pacific Air and Environment Pty Ltd, 2002b). In this study, dioxin emission factors for residential combustion activities were derived. However, because of a lack of Australian emissions data, estimates were based on information from the US, UK and the Netherlands and, as well as wood, fossil fuels such as oil or coal were also considered. However, stoves burning wood have a greater potential for dioxin emissions due to increased chlorine and/or dioxin precursors present in wood compared to oil or coal (Pacific Air and Environment Pty Ltd, 2002b). For example, much higher dioxin emissions are estimated for wood treated with pentachlorophenol (PCP) preservative.

Based on international data, Australian emission factors for PCDD/Fs of 1-3 and 1-29 µg I-TEQ /tonne fuel burned for stoves and fireplaces respectively burning clean wood were derived. Emission factors were higher for "treated" wood: 10-50 and 100-500 µg I-TEQ /tonne fuel burned for stoves and fireplaces respectively. The latter figure of 500 µg I-TEQ /tonne fuel directly reflects data from the Netherlands for combustion of wood containing PCP.

Using these emission factors and estimations of wood burning activities for different installations i.e. stoves versus fireplaces (combined total of 4000 ktonnes wood/year), the Pacific Air and Environment Pty Ltd (2002b) report estimated a total release of PCDD/Fs from residential wood combustion of 15-98 g I-TEQ/year.

With controlled burns in the emissions study, no detectable emissions of PCDD/Fs were detected above background (1 ng/kg fuel) for softwood fuel, whereas, overall, levels of 7.5 ng/kg fuel were detected for hardwood fuel. Accounting for operating parameters derived from the survey of wood burning appliance users which considered heater types, fuel types, fuel moisture content and appliance fuel loading, a final best-estimate emission factor of 4.1 ng WHO-TEQ/kg fuel was calculated. Wood treated with preservative was not tested in this study (Gras, 2002). This figure is comparable to and at the lower end of emissions factors ranges estimated previously by Pacific Air and Environment Pty Ltd (2002b) of 1-3 and 1-29 µg I-TEQ /tonne fuel for stoves and fireplaces respectively based on overseas data.

Although information on the types of wood used for heating was obtained from the users survey, this study did not provide a figure for total wood consumed. However, figures for total firewood consumed per year of 3-5.5 million tonnes was provided in the companion study by Todd (2002) on residential firewood use. This conforms well with the 4000 ktonnes/year estimate of Pacific Air and Environment Pty Ltd (2002b).

Assuming this upper figure of 5.5 million tonnes of wood combusted for residential purposes, the total release of dioxins based on the recent best-estimate emission factor from measurements from controlled burnings of Australian wood would be 22.6 g WHO-TEQ/year.

Using a current inventory estimate of total dioxin air emissions in Australia of 500 g WHO-TEQ per annum (Bawden et al, 2004) the above figure represents a contribution from residential wood combustion of 4.5% of total dioxin emissions to air.

*Summary*

In a response to the lack of quantitative Australian data on the composition of emissions arising from the use of domestic combustion heaters, Environment Australia commissioned separate companion studies reviewing residential wood fuel use, wood smoke and air toxics (Todd, 2002) and emissions from domestic solid fuel heating appliances (Gras, 2002). The studies comprised a review of residential firewood combustion, solid-fuel appliances, surveys of the number and type of wood burning appliances and fuels in use in southern Australia and the collection and analysis of emissions from controlled burns of different Australian wood fuels in different heaters.

Motor vehicles represent an anthropogenic source of dioxins. Combining overseas dioxin vehicle emission factors, Australian motor vehicle economy and activity data, fuel consumption data and total fuel use statistics, dioxin emissions of 0.6 - 24.3 g I-TEQ/year were estimated to result from motor vehicle use. Compared to the current total dioxin air emission estimation of 500 g WHO-TEQ per annum (Bawden et al., 2004) contributions from vehicle use represent between 0.1-5% of total dioxin emissions to air.

A study of dioxins in ambient air (Gras & Müller, 2003) showed a strong seasonal cycle in dioxin air concentrations. A winter concentration maximum was measured for all major population centres studied with periods of enhanced concentrations shorter in northern locations compared to southern locations. Studies of atmospheric fine particulates in Australian cities suggest that residential wood combustion for heating is a major source of winter aerosol mass. A study of emissions from wood heaters (Gras, 2002) showed that accounting for heater types, fuel types, fuel moisture content and appliance fuel loading, a final best-estimate emission factor of 4.1 ng WHO-TEQ/kg fuel was calculated for Australian wood heaters. Assuming a total of 5.5 million tonnes of total wood combusted for residential purposes (Todd, 2002), the total release of dioxins from burnings of Australian wood for heating was estimated at 22.6 g WHO-TEQ/year, representing around 4.5% of total dioxin emissions to air.

A report of the impact of bush fires on dioxin emissions established emission factors based on measurements of field fires and laboratory burns of different fuels (Meyer & Beer, 2004). Both the dioxin congener patterns and quantities of release differed considerably between the field and laboratory. In general, emission rates measured in laboratory burns were much higher than field burns. Congener patterns in laboratory burns showed the production of a wide range of dioxin/furans with furans

predominating. On the other hand, congener patterns for field fires showed predominantly formation of dioxins.

Differences in emission rates and congener patterns were explained by variations in the residence time of gases and particulates at a temperature range within the combustion space suitable for widespread dioxin/furan formation. In general, the limited heterogeneous dioxin/furan release seen in field fires was attributed to air entrainment and rapid cooling of emissions within the smoke plumes. Using National Greenhouse Gas Inventory data, total emissions of dioxins/furans/PCBs from agricultural, forest and savannah fires were estimated at 152 g WHO-TEQ/year for 1994 and 233 g WHO-TEQ/year for 2001. When compared to the current total release inventory of 500 g WHO-TEQ per annum (Bawden et al, 2004), the 2001 best estimate of this release is 46.6% of total dioxin emissions to air.

It should be noted that since bushfires, grass and scrub fires have been part of the Australian landscape for aeons, humans and the environment have been exposed to low levels of dioxin-like compounds and human metabolism has been coping with dioxin compounds for thousands of years.

An Australian dioxin ambient air study (Gras & Muller, 2003) measured dioxin levels in urban, rural and remote airsheds. Based on these data, estimated daily inhalational exposures to dioxins were calculated for 5 separate Australian population subgroups-newborn, infant (one year), child (10years), adult woman and adult man. Daily inhalation exposures per kg body weight were based on data for inhalation rates and body weights from the draft Australian Exposure Assessment Handbook (EnHealth Council, 2003)

As expected, inhalation of urban air provides a greater dioxin exposure than rural air. Of the separate subgroups examined, infants (one year) were assessed with the highest total dioxin inhalation intake per kilogram body weight (urban air, 0.174-0.178 pg WHO-TEQ/kg bw/month), followed by child (10 years) (0.148-0.157 pg WHO-TEQ/kg bw/month). Women had a marginally higher inhalation exposure per kg bodyweight to dioxins (0.017-0.018 pg WHO-TEQ/kg bw/month) than men (0.015-0.016 pg WHO-TEQ/kg bw/month), reflecting their lower body weight as compared with males but relatively similar air intake volume per unit time.

## 3.4 Intake from Soil

Humans may be exposed to dioxins from environmental or occupational sources or as a result of industrial accidents. Dietary intake is generally considered to account for approximately 95% of the human intake of dioxins in Australia. The remainder of human intakes of dioxins occurs via other routes such as inhalation and ingestion of contaminated air particles, soil ingestion and dermal contact with soil, air particles or water.

Dioxins have very low water solubility, high octanol-water partition coefficients and low vapour pressure. In soils, these physical and chemical properties of dioxins cause them to absorb strongly to soil organic matter and therefore they have limited mobility

within the soil profile. The possible environmental fates of dioxins sorbed to soil particles include burial, resuspension as dust or erosion by water to ultimately form a part of sediments lying beneath water columns. Dioxins may also volatilise from soils into the air. Due to their chemical stability and resistance to biodegradation, dioxins persist in soils.

### 3.4.1 Ambient levels of dioxins in Australian soils

Under the information gathering phase of the National Dioxins Program, the Department of Environment and Heritage commissioned a study to determine ambient environmental levels (air, water, soils and fauna) of dioxins in Australia. This section uses the data from the study designed to determine dioxin levels in Australian soils to estimate human intakes of dioxins as a result of exposure to soil.

The overall objective of the study by Müller et al (2003b) was to determine ambient environmental levels of dioxins in Australian soils across a range of landforms, climates and land-uses. Samples were collected from 86 locations representing urban, industrial, agricultural and remote sites across Australia. Urban sites were concentrated in capital cities and major towns, including coastal and inland population centres. Industrial sites were concentrated in areas dominated by industry, but no specific industries were targetted. Agricultural sites included areas used for sugarcane, cotton, grazing, forestry, cereals or horticulture. Remote sites sampled included open forest, closed forest, inland areas, coastal areas, regions subject to regular burning and regions where fire is excluded. The sampling locations covered three different regions in Australia; north, south-east and south-west with samples covering all land-use types. In addition, historical evidence of soil dioxin contamination was determined through analysis of ten samples collected from the same agricultural plot at the Waite Agricultural Research Institute, South Australia. These soil samples were collected in 1925, 1935, 1945, 1950, 1956, 1963, 1973, 1981, 1983, and 2001. Figure 3-15 shows details of the sites sampled by Müller et al (2003b).

A summary of the sampling strategy is described in Table 3-26. The sampling protocol was designed for the determination of the concentrations of dioxins in soil across a range of environments and land-uses. Sites which may have been subject to specific local contamination were avoided.

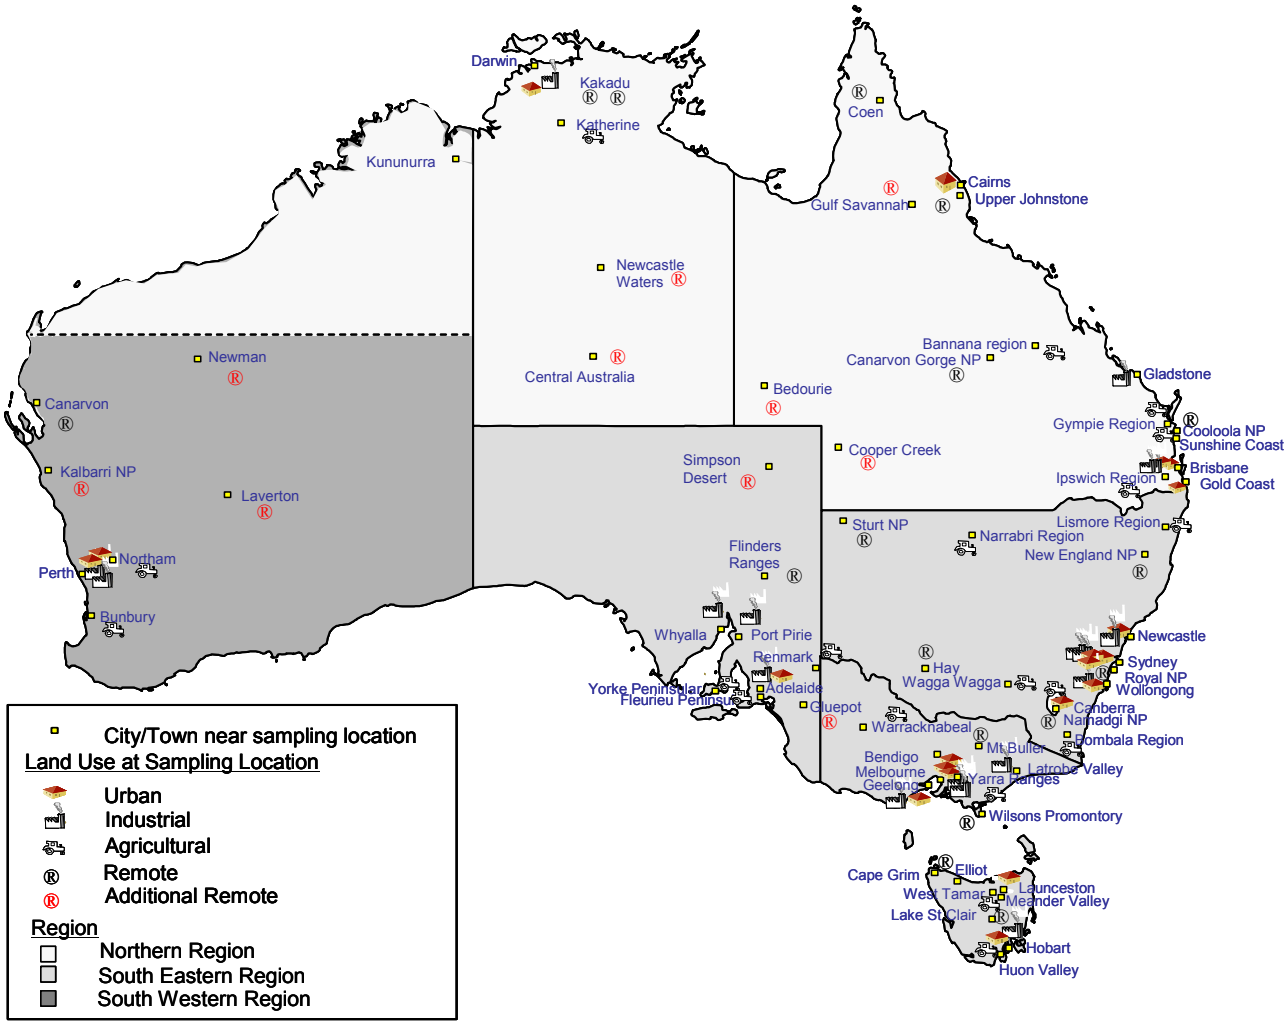

**Figure 3-15 Details of sites sampled as a part of the study to determine dioxin levels in Australian soils.**

From Müller et al, 2003

**Table 3-26 Summary of the sampling strategy and number of samples analysed for the study.**

| Land Use | Region | | | |
|---|---|---|---|---|
| | Northern | South-Eastern | South-Western | Total |
| Industrial | 6 | 18 | 3 | 27 |
| Urban | 6 | 18 | 2 | 26 |
| Agricultural | 5 | 16 | 2 | 23 |
| Remote | 6 | 10 | 3 | 19 |
| Additional Remote[1] | 6 | 2 | 1 | 9 |
| **Total** | 29 | 64 | 11 | 104 |

[1] Additional remote sampling locations were selected to specifically cover inland regions.

The analytical methodology for the determination of PCDD/Fs and PCBs was based on quantification of the analytes through isotopic dilution techniques and is modified from those described by the US EPA methods 1613B and 1668A, respectively. The study design allowed determination of both analytical and sampling reproducibility. A component of the study involved an inter-laboratory calibration in which samples that had been analysed by AGAL were analysed the Dioxin Laboratory of Environment Canada. PCDD/Fs and PCBs were reported as pg/g soil on a dry weight basis. Total toxic equivalents for PCDD/Fs (WHO-$TEQ_{DF}$), PCBs (WHO-$TEQ_{P}$) and total toxic equivalents for PCDD/Fs and PCBs (WHO-$TEQ_{DF\&P}$) were calculated using the WHO Toxic Equivalents Factors (TEFs).

Dioxins were detected in all but 1 of the 114 different soil samples analysed. Concentrations of PCDD/Fs and PCBs expressed as TEQs ranged from below the limit of detection (about 0.05 pg/g dry weight (dwt) depending on the specific sample) to 43 pg/g dwt. Dioxin concentrations in soils of north and south-east regions were similar, whereas the concentration in the soils from the south-west region was lower. The median concentration of total dioxins expressed as WHO-$TEQ_{DF\&P}$ were 0.98, 0.74 and 0.21 pg/g dwt in the north, south-east and south-west regions respectively. The highest concentrations of dioxins were found in soils near the centres of population within the south-eastern coastal regions of Australia, whereas those in western Australia and remote and inland areas were low.

The major finding from this study was that land use is a key determinant of dioxin concentrations in Australian soils. Four key land-use types were sampled in this study: industrial, urban (non-industrial), agricultural and remote. Table 3-27 gives the lower and upper bound estimates of PCDD/F, PCBs and total dioxins across land use types. The data clearly demonstrate that mean concentrations of dioxins are substantially higher in soils from urban or industrial locations than in those from agricultural and remote locations. However, mean concentrations in soils from urban and industrial locations were similar, as were those from soils from agricultural and remote locations.

One of the urban sites sampled in Hobart, Tasmania, had the highest PCDD/F concentration (approximate 43 pg WHO-TEQ/g dwt) measured in this study. When this site was re-sampled, the PCDD/F concentration was reported as 1.5 pg WHO-TEQ/g dwt. Both the original “high” value and the re-sampled value were included in the calculation of dioxin TEQs for urban soils. These TEQs were then used in the estimation of human exposure from urban soils, since the use of these “high” values would represent a “worst-case” for dioxin exposure as a result of contact with Australian soils. Table 3-27 summarizes the levels of PCDD/Fs, PCBs and total dioxins (as TEQs) in soil from different land use areas. For comparison, the mean and range of dioxin concentrations calculated from results of analyses of soils samples taken between 1925 and 2001 are also given in Table 3-27.

**Table 3-27 Dioxin concentrations Australian soils according to land use**

| Land use | Bound | PCDD/F (WHO-TEQ pg/g dwt) | | | PCB (WHO-TEQ pg/g dwt) | | | Total Dioxins (WHO-TEQ pg/g dwt) | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | Min. | Max. | Mean | Min. | Max. | Mean | Min. | Max. | Mean |
| Agricultural | Lower | 0 | 4.0 | 0.40 | 0 | 0.087 | 0.0094 | 0 | 4.1 | 0.41 |
| | Upper | 0.054 | 4.4 | 0.64 | 0.007 | 0.092 | 0.021 | 0.061 | 4.5 | 0.66 |

[2]- excludes the "high" PCDD/F TEQ value for one site in Hobart and includes the re-sampled value for that site

[3]- mean and range of results from 1925-2001

The results of the analysis of the reference site at the Waite Agricultural Research Institute are also shown in Figure 3-16. Interestingly, the oldest sample collected in the 1920s contained detectable concentrations of PCDD/Fs and also PCBs. The concentrations of dioxins in the sample from the 1920s are greater than in the samples from the 1930s and 1940s. It is uncertain whether the result is an artefact related to sampling or storage of the sample, although it is not clear how selective contamination of the oldest sample could have occurred. Furthermore, no explanation was available for the peak of dioxins observed in 1981.

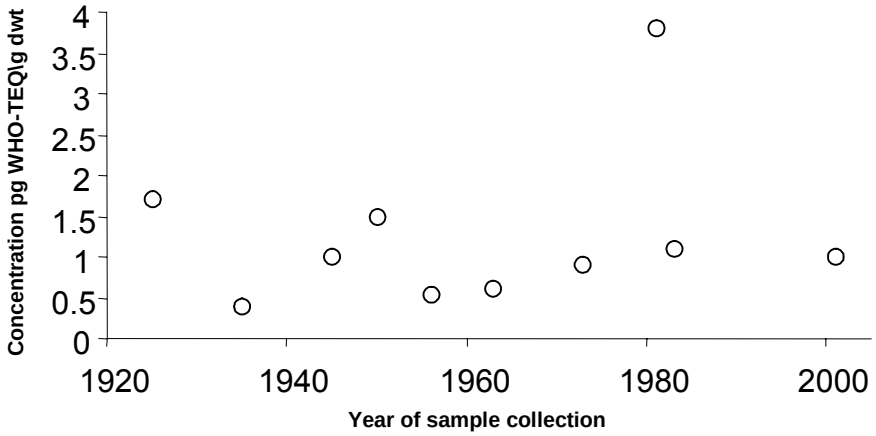

**Figure 3-16 Total dioxin concentrations (as WHO-TEQ) in soil samples taken from the reference site between 1925 and 2001.**

Modified from Muller et al, 2003b.

Typically in all samples (including the historical samples) that were collected in this study the PCDD/F homologue profile as well as the congener profiles were dominated by octachlorodibenzodioxin (OCDD). The soil congener profiles obtained from this study indicate that the dominance of the higher chlorinated PCDDs is less pronounced in samples from the more temperate regions. This result maybe seen as an indication that the domination of higher chlorinated PCDDs in samples from the tropical regions is at least in part related to fate processes of the chemicals where the least volatile and most persistent PCDDs accumulate specifically in tropical environments whereas the more volatile lower chlorinated PCDD/Fs are transported from these environment to colder climates where they remain.

The congener profile for PCBs was dominated by PCB 118 (ca.50 to 70%) followed by PCB 105 (10 to 20%). No apparent differences in PCB profiles were observed between soils from different locations.

Comparing results across different soil monitoring studies is difficult since there may be differences in the aims of the studies (e.g. determining background levels versus identification of contamination and potential hotspots), differences in the sampling regimens and methodology, and differences in the expression and reporting of results

(e.g. type of TEQs, expression - dry weight versus organic carbon basis, mean versus median, ranges). Nonetheless, Figures 3-17 and 3-18 compare dioxin concentrations across land uses from several countries, to give some indication of Australian soil levels of dioxins relative to other countries.

The concentrations of dioxins in urban and industrial locations sampled as part of the study by Müller et al (2003b) were similar to those reported in previous Australian studies (Buckland et al, 1994; Sund et al, 1993). Dioxin levels in agricultural and remote locations sampled by Müller et al (2003b) were also similar to results of previous Australian studies. However, Müller et al (1996) reported higher levels in some agricultural areas and the study by Buckland et al (1994) reported a higher maximum dioxin concentration in a bushfire-affected area. In general the dioxin levels in Australian soils were similar to those reported in the New Zealand Organochlorine Program (Buckland et al, 1998b). On the basis of toxic equivalents, concentrations of dioxins are on average much lower than those reported from many industrial sites globally and are among the lowest background concentrations internationally, across all land-uses.

Data from Müller et al, 2003b.

### 3.4.2 Estimation of dioxin intake from Australian soils

Direct human exposure to dioxins in soil can occur as a result of ingestion or by skin contact. Soil ingestion commonly occurs in young children during mouthing of toys or other objects, inadvertent hand-to-mouth transfer and as a consequence of non-sanitary eating habits. In addition, deliberate ingestion of soil (known as pica) has also been observed in young children. Although, soil ingestion also occurs in adults as a result of accidental hand-to-mouth transfer (eg. when eating or smoking), it occurs to a lesser extent in adults than in children. Direct skin contact with soils occurs in both adults and children with the extent of exposure dependent upon a number of factors including the surface area of exposed skin, the body part(s) exposed and the activity undertaken at the time of exposure.

Since a majority of the Australian population lives in urban areas that were sampled as a part of the study conducted by Müller et al (2003b), the mean lower and upper bound values for PCDD/F, PCB and total dioxins in urban soils were used to estimate the intake of dioxins from soil. The values used included the "high" PCDD/F TEQ and the resampled value for one of the sites in Hobart (see Table 3-27, row named "Urban[1]"). Formulae and assumptions used in the estimation of dioxin intakes from ingestion and estimated systemic exposure as a result of both ingestion and dermal contact with soils are given in Appendix XVII. Table 3-28 gives the estimate monthly intake of PCDD/F, PCB and total dioxins as a result of soil ingestion and Table 3-29 gives the estimated

mean monthly systemic exposure from both ingestion and dermal contact with soils and the total estimated exposure from soil.

**Table 3-28 Estimated mean monthly intake of dioxins as a result of soil ingestion**

| Age | Bound | Mean monthly oral intake* (pg WHO-TEQ/kg bw/month) | | |
|---|---|---|---|---|
| | | PCDD/F | PCB | Total dioxins |
| Child | Lower | 1.18 | 0.082 | 1.26 |
| | Upper | 1.20 | 0.082 | 1.28 |
| Adult | Lower | 0.063 | 0.0044 | 0.068 |
| | Upper | 0.064 | 0.0044 | 0.069 |

* 'oral intake' means amount ingested

**Table 3-29 Estimated mean monthly exposure to dioxins as a result of soil ingestion and dermal contact with soil**

| Age | Bound | Mean monthly exposure* (pg WHO-TEQ/kg bw/month) | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | PCDD/F | | | PCB | | | Total dioxins | | |
| | | Oral | Dermal | Total | Oral | Dermal | Total | Oral | Dermal | Total |
| Child | Lower | 0.59 | 0.141 | 0.73 | 0.041 | 0.046 | 0.087 | 0.63 | 0.187 | 0.82 |
| | Upper | 0.60 | 0.143 | 0.74 | 0.041 | 0.046 | 0.087 | 0.64 | 0.189 | 0.89 |
| Adult | Lower | 0.032 | 0.025 | 0.057 | 0.002 | 0.008 | 0.01 | 0.034 | 0.033 | 0.067 |
| | Upper | 0.032 | 0.025 | 0.057 | 0.002 | 0.008 | 0.01 | 0.034 | 0.033 | 0.067 |

* 'oral' exposure estimate assumes that 50% of dioxins ingested are systemically absorbed. See appendix XVI for formula and assumptions used for calculation of oral and dermal exposure.

The intake and systemic exposure estimates above are both likely to be overestimates since the mean TEQs for urban/industrial soils were higher than those for any other land uses sampled in the study by Müller et al (2003) and they included the "high" TEQ value from an urban site in Tasmania rather than excluding that value. Not all members of the general population would be exposed to soils containing dioxins at levels similar to those used for the intake/systemic exposure estimates. In addition, several conservative assumptions were used in calculating the intake/exposure estimates (eg. 24% or 30% of the total skin surface is exposed to the same amount of soil everyday for a lifetime).

As is the case with other components of this exposure assessment (eg. dietary exposure), comparisons between exposure assessments conducted by different groups/countries is complicated by differences in sampling, methodologies and assumptions used for intake estimates and calculating and reporting TEQs. Few other countries have undertaken soil monitoring and the estimation of dioxin intakes as a result of exposure to soil. Table 3-30 compares the intake estimates as a result of ingestion and dermal contact with soil (where available) from several countries.

The US EPA (2000) estimated exposure to dioxins from soil ingestion to be 0.063 pg WHO TEQ/kg/day (1.89 WHO-TEQ/kg/month) for children of 1-5 years of age and 0.0067 WHO TEQ/kg/day (0.201 WHO-TEQ/kg/month) for adults. A less recent

assessment conducted in the Netherlands estimated daily exposure to TCDD from ingestion of soil to be 0.1 pg I-TEQ/day (0.042 pg I-TEQ/kg/month for a 70 kg adult) (Theelen, 1991). Birmingham et al (1989) estimated intake of PCDD/Fs from soil ingestion by the Canadian population to be 0.02 pg I-TEQ/kg/day (0.6 pg I-TEQ/kg/month).

Exposure to dioxins as a result of dermal contact with soil in the USA was estimated as 0.0014 pg WHO-TEQ/kg/day (0.042 pg WHO-TEQ/kg/month) for children of 1-5 years of age and 0.0016 WHO-TEQ/kg/day (0.048 WHO-TEQ/kg/month) for adults (US EPA 2000). An assessment for the Dutch population estimated TCDD intake from dermal contact with soil as 0.15 pg I-TEQ/day (0.064 pg I-TEQ/kg/month for a 70 kg adult) (Theelen et al, 1991).

**Table 3-30 An international comparison of dioxin intake estimates (for adults) as a result of contact with soils**

| Country | Mean monthly intake (pg WHO or I-TEQ/kg bw/month) | | |
|---|---|---|---|
| | Oral | Dermal | Total |
| Australia (this report)[1] | 0.069 | 0.033 | 0.102 |
| Canada[2] | 0.60 | - | - |
| USA[1] | 0.201 | 0.048 | 0.249 |
| Netherlands[3] | 0.042 | 0.064 | 0.106 |

[3]- TCDD only

## 3.5 Intake from Water and Sediments

Under the information gathering phase of the National Dioxins Program, the Department of Environment and Heritage commissioned a series of studies to determine the ambient environmental levels (air, water, soils and fauna) of dioxins in Australia. This section uses the data from the study that measured dioxin levels in the aquatic environment (Müller et al, 2003c) to assess human intakes of dioxins as a result of exposure to water, aquatic sediments and aquatic biota.

### 3.5.1 Water

One of the studies commissioned by the Department of Environment and Heritage measured ambient levels of dioxins in the aquatic environment in Australia. This study measured dioxin concentrations in aquatic sediment, but no water samples were collected for measurement of dioxins in water. Dioxins have very low water solubility and therefore dioxin concentrations in Australian water are expected to be very low and are unlikely to contribute significantly to the overall intake of dioxins.

In a recent human health and environmental risk assessment conducted in relation to an Australian site that may have been contaminated with dioxins (a decommissioned sewerage treatment plant), dioxin levels in ground water were insignificant. Therefore,

dioxins in ground water were not considered to be a significant source of human exposure (Gorman et al, 2003). This is supported by Canadian, German and American estimates of water intakes of PCDD/Fs of 0.1, 0.005 and 0.008 pg I-TEQ/day respectively (Liem and Rappe, 1998). These estimated intakes from water were one thousandth or less of the estimated overall intakes for dioxins. Furthermore, the US EPA's 2000 draft reassessment for dioxins reports dioxin levels in water as 0.0005 pg WHO-TEQ/L and estimates intake from water to be 0.000011 pg WHO-TEQ/kg/day. Therefore, the intake of dioxins from ingestion of water is considered to be negligible in Australia and will not be considered further in this report.

### 3.5.2 Sediments

The study to determine ambient levels of dioxins in the aquatic environment in Australia involved the collection of several thousand aquatic sediment cores from locations representative of major catchments according to priorities identified by the National Pollution Inventory. A range of samples were collected in freshwater, estuarine and marine locations. In addition to sediment samples, bivalve shellfish samples were also collected when available. Fish were also obtained through local commercial fishing industries with an emphasis on local catches of table species.

Dioxins were found in all Australian aquatic sediments analysed, with levels ranging from 0.002 pg WHO-TEQ/g dry weight (dwt) to 520 pg WHO-TEQ/g dwt. Highest levels were found in Sydney harbour in the sediments from the Parramatta River estuary (100 and 520 pg WHO-TEQ/g dwt) and the western section of Port Jackson (78 and 130 pg WHO-TEQ/g dwt), which is one of the most urbanised and industrialised regions of Australia. In addition, elevated concentrations were also found in other estuarine waters near Sydney (Botany Bay) as well as the estuaries in or near Brisbane, Melbourne, Hobart, Perth and Wollongong. Considering all sediment samples, the median concentrations were 0.2, 2.3 and 0.12 pg WHO-TEQ/g dwt in sediments from freshwater, estuarine and marine locations respectively. This is due to the association of higher densities of urban/industrial areas with estuarine waters compared to remote and agricultural areas (*i*.e. interaction between urban/industrial and estuarine waters). Urban/industrial locations had significantly greater levels of dioxin-like chemicals than samples from remote and agricultural locations. Further details of the dioxins in the aquatic environment are discussed in the environmental risk assessment.

Direct human exposure to aquatic sediments is not considered to be a widespread or frequent occurrence. If it does occur, the amounts of sediment to which people may be exposed is likely to be small and the duration of contact prior to removal is likely to be short. Therefore, the human health risk associated with exposure to dioxin contaminated sediments is likely to be negligible and will not be considered any further in this report. However, since aquatic biota may be exposed to contaminated sediment, there is potential for human dietary exposure to aquatic organisms such as fish and shellfish, which may bioaccumulate dioxins. Therefore, the results of the measurement of dioxins in fish and bivalves is considered, as follows.

Dioxins were detected in all 18 bivalve samples covering the different regions and various environments of Australia. Total dioxin levels ranged from 0.0068 – 3.4 pg

WHO-TEQ/g wet weight (wwt) with a mean of 0.69 pg WHO-TEQ/g wwt. Dioxins were detected in all 23 fish samples with levels ranging 0.054 to 0.85 pg WHO-TEQ/g wwt. As expected from the sediment results for the Sydney harbour area, highest levels of dioxin-like chemicals were found in a bivalve sample (1.2 pg WHO-TEQ/g wwt) and a fish sample (0.47 pg WHO-TEQ/g wwt ) collected from Port Jackson. There was little difference between the lower bound and middle bound estimates for both bivalves and fish. A summary of dioxin concentrations in bivalves and fish collected as a part of this study is given in Table 3-31.

**Table 3-31 Middle bound mean dioxin concentration in fish and shellfish in Australia (range of min-max)**

| Organism | PCDD/F (pg WHO-TEQ/g wet weight) | PCB (pg WHO-TEQ/g wet weight) | Total dioxins (pg WHO-TEQ/g wet weight) |
|---|---|---|---|
| Fish | 0.083 (0.0051-0.48) | 0.036 (0.0016-0.37) | 0.12 (0.011-0.85) |
| Bivalves | 0.27 (0.0041-1.3) | 0.42 (0.0027-2.6) | 0.69 (0.0068-3.4) |

Although people would consume fish and shellfish caught in the areas covered by this study, the intake of dioxins from these sources has been considered as a part of the dietary intake assessment (Section 3.2.1.2). The dietary intake of fish assessed in that section incorporates both fish and shellfish. Therefore, it will not be further considered in this section. However, it is interesting to note that one of the fish fillets sampled in the food survey contained higher levels of dioxins than any of the fish samples measured in the aquatic monitoring study. Since the fish fillet with the high levels of dioxins was included in the dietary intake calculations, the intake from seafood taken from the most contaminated sites sampled in the aquatic monitoring study has been adequately modelled. Despite the higher levels of dioxins in seafoods as cf. other foodstuffs, the importance of including fish in a nutritious diet has been emphasized by many agencies and organisations (see eg. IOM, 2004).

## 3.6 Intake from Specific Exposure Sources

### 3.6.1 Industrial sources

The manufacture and use of chlorinated aromatic chemicals have been significant sources of dioxin-like compounds in the environment. In addition to the use of certain pest-control chemicals which were contaminated with dioxin-like compounds (see below), other chemicals such as the PCBs were deliberately manufactured and had industrial uses. Other industrial processes, such as the production of chlorine-bleached pulp, have also led to environmental contamination by PCDD/Fs as unwanted by-products.

Australia's National Pollutant Inventory (NPI) reports on estimates of emissions of chemical substances and where and from what sources they are generated. The NPI holds emission data reported by industrial facilities, and aggregated emission data collected by participating jurisdictions. Aggregated data cover smaller facilities that are not required to report, and mobile and non-industrial sources such as transport and

domestic activities. The accuracy of the NPI data varies according to the technique used to estimate releases. For the aggregated emissions data in particular, comparative analysis of the data may be misleading, because jurisdictions may have used different estimation techniques.

The Australian NPI provides an emission report for polychlorinated dioxins and furans; a summary of the data (reporting year 2002 - 2003) may be found *via* http://www.npi.gov.au/. 335 Facilities from 31 industry sources reported polychlorinated dioxins and furans emissions. Additional aggregated emission data were collected for 8 sources, for a total of 39 sources. Total mass emissions were estimated at 0.5 kg, of which virtually all was to air, less than 1% to land and virtually none to water. The percentage contribution from different sources was estimated to be as follows: backyard incinerators (31.6%); electrical equipment and appliance manufacturing (19.0%); basic non-ferrous metal manufacturing (10.3%); electricity supply (7.0%); burning (fuel reduction, regeneration, agriculture)/wildfires (5.2%); and 'other' (27.0%).

*PCBs*

The polychlorinated biphenyls or PCBs refer to a family of 209 congeners, that is, chemicals with the same basic structure, in which the biphenyl structure has chlorine atoms substituted for hydrogen atoms to varying degrees. Approximately 100 of these congeners are present in various technical mixtures of PCBs that were produced commercially in large quantities until the late 1970s. PCBs were used in electrical appliances, such as transformers and capacitors, hydraulic fluids, plasticisers and dye carriers. They are also generated and released into the environment as unintentional by-products of chemical manufacturing and incineration.

PCBs are amongst a broader group of harmful persistent organic pollutants (POPs) that are toxic, persist in the environment and animals, bioaccumulate through the food chain, and pose a risk of causing adverse effects to human health and the environment. Because of their physical characteristics, POPs are transported long distances and are often deposited in areas where they have never been used or produced. As discussed elsewhere in this document, some PCBs have dioxin-like characteristics. Concerns over the potential risks to health, food chain and environment led to a ban on the importation of PCBs and PCB-contaminated or PCB-containing equipment to Australia in the 1970s.

Australia has a PCBs Management Plan for disposal and destruction of PCBs. Details of the plan are available from the Department of the Environment and Heritage (DEH) website at www.deh.gov.au/industry/chemicals/scheduled-waste/pcbs/index.html.

### 3.6.2 Chlorinated pesticides - manufacture and use

The manufacture and use of chlorinated aromatic chemicals have been significant sources of PCDD/Fs in the environment. Such chemicals include the wood preservative and biocide pentachlorophenol (PCP) and the herbicide 2,4,5-trichlorophenoxyacetic acid (2,4,5-T).

Historically, higher-level exposures to PCDD/PCDFs in PCP and 2,4,5-T has probably been restricted to relatively small groups of people involved in the handling and use of the pesticides. For example, a study published in 1992 reported that the blood serum TCDD levels in pesticide applicators involved for many years in ground-level spraying of 2,4,5-T in New Zealand were significantly higher than those of a comparison group (Smith et al, 1992). PCP and 2,4,5-T are no longer approved for use in Australia.

*2,4,5-T*

The herbicide 2,4,5-T (2,4,5-trichlorophenoxyacetic acid) was introduced in the 1960s and was once used in Australia to control woody weeds such as blackberries. It is a relatively simple chemical that structurally mimics certain natural plant growth regulators. It is difficult to manufacture pure 2,4,5-T without some contamination by dioxins; TCDD alone is the major contaminant of 2,4,5-T (Schechter et al, 1998). Dioxin levels in 2,4,5-T were generally in the low ppm to high ppt range, with more recently produced batches typically contaminated at the lower levels. 2,4,5-T was withdrawn from use in the late 1980s and is no longer approved for use or marketed in Australia. Furthermore, 2,4,5-T with dioxin contamination is now strictly controlled in international trade through the UNEP Prior Informed Consent or PIC Procedure (the 'Rotterdam' Convention).

The links between dioxins and potential adverse health and environmental effects have been established for well over 20 years. With respect to dioxin contamination of 2,4,5-T, appropriate controls to protect human health were established in the early 1970s via standards set by the National Health and Medical Research Council (NHMRC). In 1975, the NHMRC established a maximum level of dioxin contamination in 2,4,5-T of 0.1 mg/kg (100 ppb). In 1982, this level was lowered 10-fold to 0.01 mg/kg, reflecting improved analytical capability to monitor dioxin levels in technical-grade 2,4,5-T. At the time, both these standards were considered adequate to protect the health of agricultural workers and the public. Illegally imported batches of chemical which have been the subject of a Western Australian (WA) investigation have been reported as containing 200 times the 1975 standard, although definitive evidence that such contaminated 2,4,5-T was used in the Agricultural Protection Board spraying program is lacking.

The Western Australian Parliament conducted an inquiry into a government weed control program undertaken by the Agriculture Protection Board (APB) from 1975 to 1985 in the Kimberleys and other regions of WA. It has been suggested that some of the 2,4,5-T used may have been heavily contaminated by dioxins, with some evidence indicating that contaminated stock may have been illegally imported from about 1969 to 1971. Apart from the formation of toxic dioxins during manufacture of 2,4,5-T, if pure 2,4,5-T is subjected to high temperatures (eg. as in a factory fire, which may have been the case with contaminated material imported into Western Australia), 2,4,5-T molecules can chemically combine to form dioxins. This is also the case with its immediate precursor, 2,4,5-trichlorophenol (TCP).

An Occupational Health Physician, Dr Andrew Harper, interviewed 90 former Agricultural Protection Board (APB) employees involved with this Government

spraying program. His report, the Kimberley Chemical Use Review (Harper, 2002), concluded that exposure to unregulated levels of dioxins could not be ruled out. Whilst Dr Harper acknowledged that the review was not a scientific investigation, he found an association between illness and exposure to herbicides and considered that about one third of those interviewed had developed a chronic disability that was possibly or probably attributable to these chemicals. He also suggested that longer serving workers may have been more commonly affected. The WA State Government considered that further evaluation was required before the conclusion of this review that "illness developed in association with the spray" could be accepted. Consequently, an Expert Medical Panel was appointed to evaluate the results of the review. The Panel, chaired by Bruce Armstrong, Adjunct Professor of Epidemiology at the University of Sydney and Director of the NSW State Cancer Council's Epidemiology Unit,
produced an interim progress report, the Interim Report of the Expert Medical Panel to Evaluate the Kimberley Chemical Use Review Recommendations , which was tabled in the WA Legislative Council on 13th March 2003. The Panel requested that additional work be undertaken, including further analysis of data on the health status of former APB employees, and a review of the risk assessment and adverse event reporting mechanisms for chemicals used in agricultural protection programs. The Panel subsequently re-convened to consider this information and a further report was forwarded to the WA Cabinet in February 2004. The final report of The Expert Medical Panel to Evaluate Recommendations of the Kimberley Chemical Use Review, dated December 2003, was published on the internet on 27th February 2004 (accessed via http://www.ministers.wa.gov.au).

The Panel concluded the following:

1. Based on published evidence identifying a 'probable' link between exposure to chlorphenoxy herbicides containing TCDD and an increased overall cancer risk; the likelihood that spray workers were highly exposed to the herbicide (which may or may not have contained unregulated levels of TCDD); and evidence that APB workers have experienced a somewhat higher incidence of cancer than the community overall, albeit not statistically significant, the Panel concluded that "APB workers may suffer or may have suffered already an increase in the risk of cancer due to their exposure to herbicides containing the dioxin TCDD in the spray program". With respect to cancers, 17 APW workers were matched to people on the WA Cancer Registry, with 18 cancers; only two cancers (non-Hodgkin lymphoma and one which might have been a retroperitoneal soft-tissue sarcoma) were of a type linked to exposure to chlorphenoxy herbicides or TCDD. With respect to all cancer incidence cf. a comparison Kimberley population, a high degree of uncertainty about the true difference is due to the small number of observed cancer cases in the APB cohort.

2. The symptoms of ill health that the APB workers reported do not form a pattern such as to suggest that they were directly caused by their exposure to herbicides during their employment in the spray program. Furthermore, the symptoms of anxiety and depression reported by the APB workers were no more prevalent in the APB workers than in the general community; hence they are unlikely to be due to their employment in the spray program.

3. Little evidence was available to determine whether or not the APB workers have experienced increased rates of a number of other conditions that might possibly be caused by exposure to chlorphenoxy herbicides containing dioxins. No cases of chloracne were reported to have been diagnosed in APB workers; a definitive diagnosis of this condition would have indicated exposure. For diabetes, possibly associated with exposure to dioxins (see Chapter 2), its prevalence in the Australian aboriginal population is high and any additional effect from dioxin exposure would be very difficult to distinguish. In fact, expected deaths from diabetes in the indigenous population was "appreciably" greater than that actually observed in APB workers.

4. On the basis of a best estimate Standardised Mortality Ratio (SMR) of 1.09 (95% CI = 0.79-1.42), the Panel concluded that there was no strong evidence to suggest that the mortality in APB workers was higher than in the general Kimberley population.

5. A majority of the Panel recommended that a survey of serum TCDD levels be conducted in APB workers and a comparison population in the Kimberley. The results of such a survey could strengthen the evidence for the Panel's conclusion that APB workers may suffer or may have already suffered an increase in the risk of cancer due to their exposure to herbicides.

In its response, the Government of WA advised that it would act expeditiously through the workers' compensation system to assist APB workers diagnosed with cancer. Specifically, "the Government employer (APB) and insurer (RiskCover) will accept that cancers diagnosed in a former worker in the Kimberley weed spraying program, now or in the future, and assessed as being linked to 2,4,5-T herbicide use, will be eligible for consideration for compensation".

*Pentachlorophenol*

The historical use of pentachlorophenol (PCP) in the timber industry has resulted in occupational exposure to PCDD and PCDFs for some timber workers. It appears that the higher chlorinated (five to eight chlorines) PCDDS and PCDFs are found at elevated levels (Schecter et al, 1998). PCP was widely used both for anti-sapstain treatment for the interim protection of freshly sawn timber against fungal staining and as a permanent timber preservative. In addition to acute health effects of PCP exposure (including eye irritation, upper and lower respiratory tract irritation and skin changes such as burning, irritation and dermatitis), effects of contaminants such as dioxins were of concern. Whilst there does not appear to be any firm evidence of significant long-term health effects from the use of PCP, the possibility of such effects cannot be excluded.

Chlorinated phenols such as PCP were widely used in Australia to protect softwood timber from decay. In 1996 the then Department of Health and Family Services provided written comments to the Australian Pesticides and Veterinary Medicines Authority (APVMA; then the National Registration Authority for Agricultural and Veterinary Chemicals, or NRA) on acceptable levels of microcontaminants in PCP. The

impurities of concern in PCP were hexachlorobenzene (HCB) and dioxins, in particular tetrachloro-dibenzodioxins (TCDDs) and hexachloro-dibenzodioxins (HCDDs). Impurity limits were proposed, in the interests of ensuring that the Australian standard for dioxins and HCB impurities were at the lowest levels that can be achieved in the manufacturing method. However, at that time, it appears that PCP and pentachlorophenoxide were exempt from NRA requirements for technical-grade active constituent approval and thus these recommendations were not further considered. A search of the APVMA's pesticide products database indicates that, whilst there were two old PCP-containing wood-treatment products on the database in 1996, there are now no such registered products on the Australian market. However, PCP may be available in Australia for industrial and manufacturing purposes, and inappropriate continued use from stored stocks cannot be discounted.

With regard to those workers who have been exposed to PCP contaminated with dioxins, it is likely that they have concentrations of these chemicals in their blood higher than those in the general population. Whether or not they have experienced symptoms and health effects at these concentrations is unknown. Although PCDD/Fs gradually break down and are eliminated from the body, because these chemicals have long half-lives these workers can continue to be exposed for quite some years after workplace exposure ceased.

*Other pesticides*

As part of an ongoing review of 2,4-D, targeted for completion in 2004, Canada's Pest Management Regulatory Agency (PMRA) has found that in addition to 2,4,5-T and pentachlorophenol (PCP), pesticides known to be contaminated with dioxins, several other pesticides currently used in Canada may contain traces of dioxin and furans. Dioxins were found in 2,4-D although not in amounts causing any environmental concern. Other pesticides reported as containing dioxin include chlorthal-dimethyl (also known as dimethyl tetrachloroterephthalate, Dacthal or DCPA), dicamba, dichlorprop (2,4-DP), hexaconazole, MCPA, mecoprop and quintozene. This issue is being examined by the Australia's pesticide regulator, The Australian Pesticide and Veterinary Medicines Authority (APVMA). A Canadian media report of the PMRA finding also listed "dichlorophenoxyl-phenol" as one of the pesticides; this appears to be an incorrect reference to 5-chloro-2-(2,4-dichlorophenoxyl) phenol (i.e. the disinfectant 'Triclosan') which may contain traces of several non-toxic dioxin congeners. The issue of impurities in Triclosan has been previously investigated by NICNAS within DoHA's Office of Chemical Safety.

### 3.6.3 Cigarettes

Dioxins are a natural product of the combustion of organic material. The amount of dioxins formed depends principally on: (1) high temperature processes and/or incomplete combustion; (2) the presence of organic carbon; and (3) the presence of chlorine (either in organic or inorganic form). The presence of materials containing dioxins will obviously also increase the release of these substances during the combustion process (UNEP Chemicals, 2003).

Tobacco leaf naturally contains both organic carbon and chloride ions (regardless of the presence or absence of pesticide residues or chemical/flavouring additives in the tobacco) and consequently, as for any thermal process, “combustion” of cigarettes and cigars produces dioxins.

Investigations of the ten most popular brands smoked in Germany gave “emissions” of 0.1 pg I-TEQ/cigarette (Ball et al, 1990). There were no results from cigars, but given the greater quantity of tobacco present in a cigar (2 - 20 times that of a cigarette), a value of approximately 0.3 pg I-TEQ is reasonable.

Lofroth and Zebuhr (1992) report dioxin concentrations in both mainstream and sidestream smoke from one brand of Swedish cigarettes as approximately 1 pg I-TEQ per cigarette for mainstream smoke (smoke from 20 cigarettes; one 2-second puff of 35 ml, each minute) and 2 pg I-TEQ per cigarette for sidestream smoke. No individual isomer made up more than 20% of the total dioxin content with most isomers below the detection limits of 0.3 – 1.3 pg. These values are about 10-times those reported in the German study, although the congener profiles were relatively similar. Dioxins have also been reported in tobacco smoke by Muto and Takizawa (1989).

In Australia, recent estimates (November 2002) suggest that approximately 1/5$^{th}$ (19.8%) of the population smoke (Wakefield & Bobevski, 2003). The average number of cigarettes smoked per day (factory made and 'roll-your-own'), including those who smoke on a daily or weekly basis, is 14.4 ($\pm$ 12.2 SD; n = 1,585) and for daily smokers, 15.7 + 12.2 (n = 1,414).

Assuming an intake per cigarette of between 0.1 - 0.5 pg TEQ (the upper value assuming inhalation of 50% of mainstream smoke containing 1 pg TEQ/cigarette; see above) would give a daily inhalation intake for an 'average' smoker of around 1.5 - 7.5 pg/day. Assuming 100% uptake *via* the lungs (see Section 3.3) means that the systemic exposure estimate would be the same. Ball et al (1990) estimated that smoking 20 cigarettes/day could result in a TEQ intake (PCDD/Fs) of up to 3 pg/day.

A daily inhalation intake for an 'average' smoker of around 1.5 - 7.5 pg/day is equivalent to ca. 0.5 - 3.0 pg/kg bw per month (assuming a bodyweight of 70 kg). While it is not clear whether the cigarette TEQs from the published literature are based on lower bound or upper bound estimates, they may be crudely compared with the mean estimated intake of PCDD/Fs from food in Australia of 0.9-10.2 pg WHO-TEQ/kg bw per month (lower bound and upper bound means for the population greater than 2 years old; see Section 3.2.1). This means that with an intake from smoking possibly being 1/3$^{rd}$ of that coming from food, smokers are likely to have a measurably elevated dioxin intake cf. non-smokers. This intake comparison is consistent with the US intake estimate, with PCDD/F exposure *via* cigarette smoking representing "over 10 percent of the average daily background dose of CDD/CDFs from soil, air, water and foods" (US EPA, 2000).

Non-smokers are also likely to be exposed to dioxins from passive intake of cigarette smoke. However, individual exposure to so-called 'sidestream' smoke is much more variable than the exposure of smokers themselves since it depends on a person's proximity to smokers, how often they are near smokers, and the extent of ventilation in

the smoking area. These extra uncertainties mean that it is not feasible to reasonably estimate the contribution of inhaled sidestream smoke to dioxin intake.

Whilst we do not have any experimental data in animals on the cancer risks from inhalation exposure to dioxins, available evidence suggests that for smokers, the health risks from other toxic and carcinogenic components of cigarettes far outweigh the likely health risk from the PCDD/Fs. However, it appears that encouraging people to give up smoking would help to reduce their body burden of dioxins; in young women in particular, smoking has the potential to increase their tissue levels of dioxins which can ultimately transfer to any future offspring *via* prenatal (transplacental) and postnatal (breast feeding) routes.

In view of the age of the available studies on dioxins in cigarette smoke (Ball et al, 1990; Lofroth & Zebuhr, 1992; Muto & Takizawa,1989), this could be an area for further investigation eg. laboratory experiments to accurately quantify release from burning cigarettes and epidemiology studies to see if cigarette smokers do indeed have higher body burdens of dioxins cf. matched controls (ie. to clearly ascertain whether cigarettes are a dioxin-source problem or not).

## 3.7 Exposure Estimates from All Sources

### 3.7.1 Estimated intake of dioxins from all sources

The total dioxin intake for the Australian adult population can be estimated by adding the estimated intakes from all sources of exposure. Table 3-32 gives the estimated PCDD/F, PCB and total dioxin intakes from air, food, soil and water, and the total estimated intake of dioxins for Australian adults. From this data it can be seen that intake from food represents between 95% and 99% of the total intake of dioxins, with intake from contact with soils and breathing of air representing 5% or less of the total intake of dioxins for Australian adults.

**Table 3-32 Estimated exposure of Australian adults to dioxins from all sources**

| Source of exposure | Total intake (pg WHO TEQ/kg bw/month) | | | | | |
|---|---|---|---|---|---|---|
| | PCDD/Fs | | PCBs | | Total dioxins | |
| | Lower bound | Upper bound | Lower bound | Upper bound | Lower bound | Upper bound |
| Air[1] | 0.104 | 0.111 | 0.016 | 0.017 | 0.120 | 0.127 |
| Food[2] | 0.9 | 10.2 | 2.8 | 5.4 | 3.7 | 15.6 |
| Soil[3] | 0.057 | 0.057 | 0.01 | 0.01 | 0.067 | 0.067 |
| Water[4] | - | - | - | - | - | - |
| **TOTAL** | 1.06 | 10.37 | 2.83 | 5.42 | 3.89 | 15.79 |

[1]- mean of adult male and female intake for urban airshed exposure
[2]- all Australians 2+ years of age, lower and upper bound estimates use LOQ rather than LOD
[3]- total of both dermal exposure and ingestion of soil from urban sites
[4]- intake from water was not estimated but is expected to be negligible (see Section 3.5.1)

The intake estimates given in Table 3-32 do not include an estimate of dioxin intake from cigarette smoking. Cigarette smokers will have a higher intake of dioxins than

non-smokers. Section 3.6.3 estimates a smoker's intake of PCDD/Fs from cigarette smoke as 0.5-3.0 pg
I-TEQ/kg bw/month, which is up to approximately one third of the upper bound PCDD/F intake estimated from food. No data were available on PCBs in cigarette smoke. Assuming that the PCB intake of a smoker is the same as a non-smoker, then a conservative upper bound estimation of the total dioxin intake of an average smoker is approximately 19 pg TEQ/kg bw/month.

Table 3-33 gives the estimated PCDD/F, PCB and total dioxin intakes from air, food, soil and water, and the total estimated intake of dioxins for young children in Australia. From this data it can be seen that intake from food represents between 86 and 97% of the total intake of dioxins, while intake from contact with soils and breathing of air represents between 3 and 14% of the total intake of dioxins.

The estimated total dioxin intakes of young Australian children are higher than those of the Australian adult population. This is expected since children have higher levels of food consumption relative to body weights than adults and intake from food represents the greatest source of exposure to dioxins. The estimated total dioxin intake from air is only slightly higher in young children than adults, but young children have significantly higher intakes of dioxins from soil since they have the potential to ingest much more soil than adults.

**Table 3-33 Estimated exposure of young children in Australia to dioxins from all sources**

| Source of exposure | Total intake (pg WHO TEQ/kg bw/month) | | | | | |
|---|---|---|---|---|---|---|
| | PCDD/Fs | | PCBs | | Total dioxins | |
| | Lower bound | Upper bound | Lower bound | Upper bound | Lower bound | Upper bound |
| Air[1] | 0.174 | 0.185 | 0.027 | 0.028 | 0.202 | 0.213 |
| Food[2] | 1.9 | 25.0 | 4.3 | 11.8 | 6.2 | 36.7 |
| Soil[3] | 0.73 | 0.74 | 0.087 | 0.087 | 0.82 | 0.83 |
| Water[4] | - | - | - | - | - | - |
| **TOTAL** | 2.80 | 25.92 | 4.41 | 11.91 | 7.22 | 37.74 |

1- intake of 1-year old child for urban airshed exposure
2- children 2-4 years of age, lower and upper bound estimates use LOQ rather than LOD
3- total of both dermal exposure and ingestion of soil from urban sites by a child 2-3 years of age
4- intake from water was not estimated but is expected to be negligible (see Section 3.5.1)

Other than the US EPA's (2000) comprehensive human exposure and health assessment, there are few recent, readily available multimedia dioxin health risk assessments that have been conducted by other countries. Liem and Rappe (1998) compared estimated daily exposures to PCDD/Fs in Canada, Germany, the Netherlands, the United Kingdom and the United States of America. However, these estimates were based on data collected in the late 1980s or early 1990s and several studies have shown that human exposures to dioxins have declined significantly since then, making it inappropriate to compare data collected approximately a decade apart (Codex Alimentarius Commission, 2003; European Commission, 2002; Food Standards Agency (UK) (2003); US EPA, 2000; Malish and Van Leewen, 2003).

Table 3-34 compares the recently estimated intake of dioxins in Australian and US populations with a US estimate of PCDD/F intake prepared in 1994 (US EPA, 1994). The data illustrate the decline in PCDD/F intake that has occurred in the USA since the early 1990s and shows that the current Australian dioxin intake estimates are lower than the recent US EPA estimates, even allowing for the fact that the Australian upper bound mean is being compared with the US middle bound mean. The PCDD/F intake estimates made in the late 1980s/early 1990s for 4 other countries and reported by Liem and Rappe (1998) were similar to those in the USA measured at about the same time (US EPA, 1994).

**Table 3-34 Estimated adult intakes of dioxins from all sources: a comparison of recent Australian and American estimates with an American PCDD/F intake estimate from 1994.**

| Source of exposure | Total intake (pg WHO TEQ/kg bw/month) | | | | | | |
|---|---|---|---|---|---|---|---|
| | PCDD/Fs | | | PCBs | | Total dioxins | |
| | Australia 2004[1] | USA 2000[2] | USA 1994[3] | Australia 2004[1] | USA 2000[2] | Australia 2004[1] | USA 2000[2] |
| Air | 0.111 | 0.69 | 0.94 | 0.017 | - | 0.127 | 0.69 |
| Food[4] | 10.2 | 16.7 | 49.7 | 5.4 | 10.2 | 15.6 | 26.76 |
| Soil[5] | 0.057 | 0.249 | 0.34 | 0.01 | - | 0.067 | 0.249 |
| Water | - | 0.0003 | 0.003 | - | - | - | 0.0003 |
| **TOTAL** | 10.37 | 17.7 | 51.4 | 5.42 | 10.2 | 15.79 | 27.9 |

[1]-upper bound mean
[2]-middle bound mean, except soil which is lower bound mean
[3]-middle bound I-TEQ estimate
[4]-total intake from all foodstuff
[5]-includes dermal and ingestion intakes for Australia 2004 and USA 2000 and soil ingestion for USA 1994

The intake estimates given in Tables 3-32 and 3-33 were calculated by combining the measured dioxin concentrations in environmental media and food with the estimated extent of contact (by ingestion, inhalation, dermal contact etc) with the media (see Sections 3.2 to 3.6). This approach gives the estimated current intake of dioxins in the Australian population.

Since dietary intake contributes by far the greatest proportion of the total intake of dioxins, the variability and uncertainty associated with the dietary intake assessment are the factors most likely to impact significantly on the overall intake assessment. In general terms, the major sources of uncertainty associated with the dietary intake assessment are those related to the analysis of dioxins in foodstuffs and those related to assumptions used in the dietary exposure modelling. Examples of some of the possible sources of uncertainty include the use of upper bound estimates (which generally leads to an overestimate of intake), the use of 24-hour recall survey data, the limited range of foodstuffs analysed and assumptions that certain foods that were not analysed contain dioxins at the same levels as similar foods that were analysed. For further details of some of the assumptions and uncertainties associated with dietary intake assessment see Section 3.2 and FSANZ (2004).

Other sources of uncertainty associated with the estimation of dioxin intake from all sources include the use of several default parameters for assessment of intakes from soils and air eg. assumptions about population average body weights and body fat percentages, air intake volumes, extent of contact with soils, the half- life of dioxins in the human body etc. Another potential source of uncertainty is the possible omission of a significant, but unidentified source of dioxin intake. Overall, the use of conservative assumptions, in particular the use of upper bound estimates for intake calculations, is most likely to have resulted in an overestimate of dioxin intake by the Australian population.

### 3.7.2 Estimating intake from measured body burdens

An alternative approach to investigating the exposure of the Australian population to dioxins is to estimate the average lifetime daily exposure (ALDE) from the measured body burdens of dioxin using a simple pharmacokinetic model. This approach to estimating dioxin intake is detailed in Section 3.1.1.5, and is based upon the fact that, assuming a steady-state between intake and excretion, a theoretical estimated average daily intake which would lead to a measured body burden can be calculated. Estimation of the total body burden of dioxins takes advantage of the fact that the concentration of these compounds in fat is constant throughout the body. Thus, whatever fat sample is used (eg. fat in blood or breast milk samples) gives an estimate of the concentration in all fat in the body. Then, using data on the percentage of total body weight which is made up of fat, the total body burden of dioxin can be easily estimated.

The ALDE estimated across all age groups to achieve the measured blood levels of dioxins was 1.3 pg WHO-TEQ/kg bw/day (40 pg WHO-TEQ/kg bw/month). This is approximately 2.5 times higher than the total dioxin intake estimate for adults calculated from current levels in food and the environment (15.7 pg WHO-TEQ/kg bw/month). The US EPA (2000) found daily dioxin intake estimated on the basis of blood serum data was approximately 2.2 times higher than the dioxin intake estimated from current levels in food and the environment. This difference is expected since the intake estimate based on blood serum measurement reflects past exposures to dioxin levels in food and the environment, which were higher than current levels (as outlined above and in Section 3.1). In addition, there is likely to be significant variability and uncertainty associated with each of the estimates.

It will be apparent that the calculations of TEQ intakes show that infants and children have higher intake rates than adults on a bodyweight basis (for reasons given in Section 3.7.1), yet simple ALDE calculations indicate the opposite. The reasons for this apparent discrepancy in the ALDE calculations include the fact that environmental levels of dioxin-like compounds were higher in the past than they are at present and thus adults have had proportionately greater exposure than younger people ie. given that the annual exposure to dioxin-like compounds has decreased over the decades, a back calculation using body burden in older age groups would be expected to yield a higher estimate of ALDE than one done for a younger age group that is only affected by more recent intakes. Furthermore, this simple steady-state model makes the assumption of constant half-life over the lifetime of an individual, an assumption which is very unlikely to be correct. If the average half-life increases with age, as expected with reduced fecal excretion and changing metabolism of dioxins (see discussion at Section 3.2.3), then a higher ALDE would be calculated for the younger, and a lower ALDE would be calculated for the older age categories ie. the discrepancy in ALDEs between the age groups would be much less apparent.

Thus, the use of a simple steady-state model which assumes a constant elimination half-life for dioxins in the human body regardless of its age or physiological status, can at best provide only a relatively crude back-estimate of a daily dioxin intake which may have led to a measured body burden at a particular time in life.

# 4. Health risk assessment

## 4.1 Health Risks for the General Population

### 4.1.1 Dietary exposure as a proportion of the Tolerable Monthly Intake (TMI)

Figure 4-1 shows the mean estimated monthly exposure to total dioxins for the range of population groups aged 2 years and above expressed as a percentage of the TMI. Appendix XVIII contains detailed tables of the mean and 95th percentile exposure results, as a percentage of the TMI, for PCDD/F, PCBs and total dioxins.

In all cases, the mean and 95th percentile estimated dietary exposure to total dioxins for all age-gender categories (from 2 years and above) were below the TMI of 70 pg WHO-TEQ/kg bw/month. Across all age groups from 2 years and above, the estimated mean exposure to total dioxins was between 5% (lower bound) and 22% (upper bound) of the TMI. The 95th percentile exposure for the same population was between 23% (lower bound) and 58% (upper bound) of the TMI. For the population groups representing the younger members of the population, the mean and 95th percentile dietary exposure estimates are higher percentages of the TMI, as a result of their lower bodyweights and a higher proportion of milk and dairy products in their diets.

The mean estimated dietary exposure for infants aged 9 months (fed 50% infant formula/ 50% solids, see Section 3.2.1.2) as a percentage of the TMI was considered separately from other population groups since this was derived using a different methodology and cannot be directly compared to other population groups. For this population group, the 95th percentile exposures were not calculated (see Section 3.3 for discussion). Estimated mean exposure to total dioxins for infants aged 9 months was 17% (lower bound) to 87% (upper bound) of the TMI. Infants at this age had the highest calculated mean exposure to total dioxins as a percentage of the TMI because of their high food consumption relative to body weight.

It is apparent that the estimated dietary intake vs age gives a different picture from that obtained when average lifetime daily exposures (ALDEs), which are back-calculated from measured dioxin body-burdens using a simple steady-state model, are plotted vs age. The errors and uncertainties in the simple model used for ALDE calculations are given in sections 3.1.1.5 and 3.7.

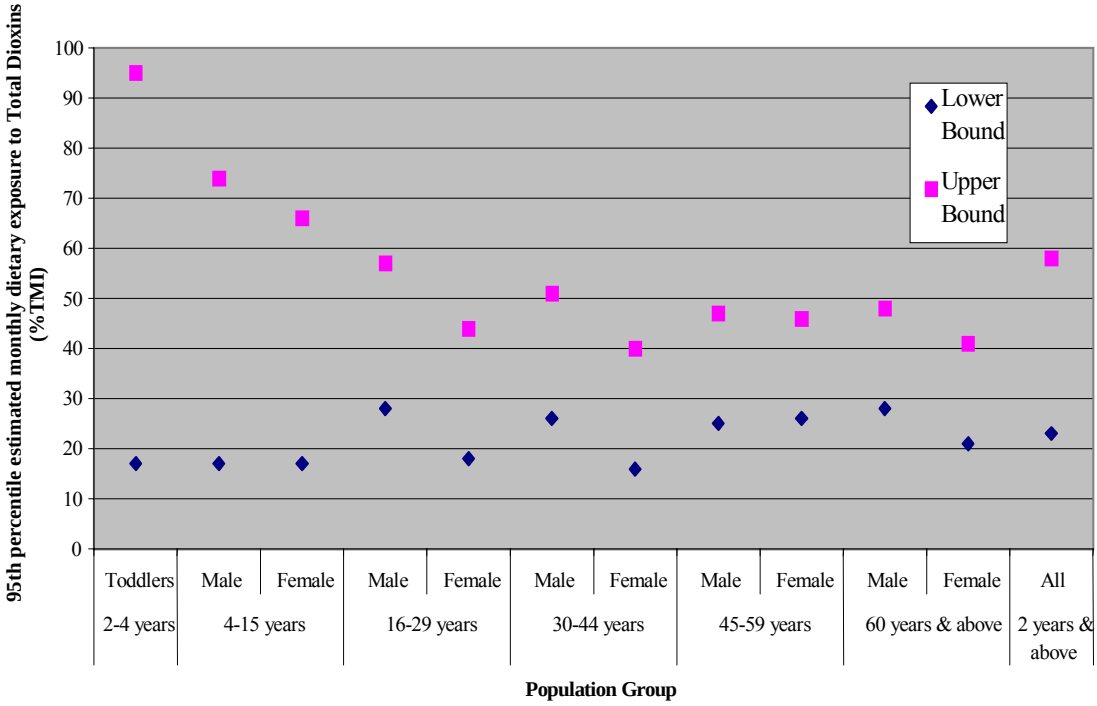

**Figure 4-1 Mean estimated dietary exposure to total dioxins as a percentage of the TMI**

*Lower Bound – assumes results reported as being below the LOQ are zero.*
*Upper Bound – assumes results reported as being below the LOQ are at the LOQ.*
*Australian TMI = 70 pg TEQ/kg bw/month.*
*Dioxins = sum of intakes of PCDD/F and PCBs.*
*Estimated dietary exposures are based on food consumption data from the 1995 NNS*

### 4.1.2 A comparison of intake from all sources with the TMI

The potential risk to the health of the general public as a result of exposure to dioxins can be estimated by comparing the current exposure estimates (outlined in Section 3.7) with the tolerable monthly intake (TMI) for dioxins. The upper bound mean total dioxin intakes for adults and young children (approx. 1-4 years of age) in Australia were 15.6 and 37.5 pg WHO-TEQ/ kg bw/month respectively. These estimates of intake represent 22% and 54% of the TMI of 70 pg WHO-TEQ/kg bw/day respectively. However, it should be noted that the upper bound intake estimates given in Section 3.7 are likely to be conservative overestimates, therefore the average intake by these two age groups is likely to be less.

Since the TMI is determined on the basis of the most sensitive adverse effects observed in animal studies and includes an appropriate safety factor, it is considered unlikely that the estimated average dioxin exposure of the Australian population (1+ years of age) would result in any appreciable health risk. However, because there are uncertainties in our understanding of the health effects that may be associated with exposure to dioxins, higher margins of safety are desirable to further reduce the potential for any possible risk to public health as a result of such exposure.

The intake from all sources was not calculated for children <1 year of age. However, the discussion in Section 4.1.1 about the dietary intake of a 9-month old infant fed 50% infant formula and 50% solids indicates that the total dioxin intake of this group of the population (fed this diet) is likely to be slightly lower than the TMI. It should be noted that the intake of infants is likely to have been overestimated and infants would only be exposed at these levels for a small proportion of the total lifetime. Section 4.2 includes further discussion of the potential for health risks in breast-fed infants.
In addition to the average exposures of the Australian population there may be certain segments of the population that could have exposures somewhat higher than the general population as a result of occupational exposure, smoking or elevated dietary exposure to certain foods that may contain high levels of dioxins. The potential health risk for segments of the population that may have elevated exposure to dioxins is detailed in Section 4.2.

### 4.1.3 Cancer risk

The IARC and other agencies/organisations have concluded that the available epidemiology data suggest that TCDD is likely to be a human carcinogen. Statistically significant increases in risks for all cancers were found in highly exposed workers with longer latency periods. Although the estimated Standardised Mortality Ratios (SMRs) for cancer were consistent across studies with the highest exposures, they were generally low.

A number of national agencies have endeavoured to provide quantitative estimates of cancer risk, based on low-dose extrapolation from both animal and human data. In view of the ongoing debate about the existence of a threshold level below which dioxins will not increase cancer risk, about the potency of the various dioxins, furans and PCBs in causing cancer, and the variability in various quantitative risk estimates, this assessment has not endeavoured to conduct a quantitative risk assessment. The available data from high dose animal studies and studies of human occupational and accidental exposures cannot be extrapolated quantitatively with any confidence down to values corresponding to the background exposures of the general population.

However, it is noted that the body burden of dioxins in the general population is several orders of magnitude lower than the body burdens of the most highly exposed industrial cohorts or by the neighbouring population during the industrial accidental exposure at Seveso (eg. Kogevinas, 2000), where there is evidence of some increased cancer risk. Although the excess cancer risk at the highest exposures in human epidemiology studies are statistically significant, most assessments of the cancer risks posed by dioxins note that these results need to be evaluated with caution as the overall risks are not high and the strongest evidence was for industrial populations with high exposures to dioxins, and also with heavy exposure to other chemicals. Furthermore, lifestyle factors such as smoking were not evaluated. JECFA also noted, *inter alia*, that there were few precedents of carcinogens that increase the risk for cancer at all sites combined, with no excess risk for any specific tumour predominating.

In the high-exposure industrial cohorts studied by IARC (IARC, 1997), blood lipid levels estimated to the last time of exposure were 2000 ng/kg (mean, with levels up to

32,000 ng/kg; US cohort), 1434 ng/kg (geometric mean, range 301 - 3,683 ng/kg; Dutch cohort), 1008 ng/kg (geometric mean; German workers with severe chloracne), and up to 2252 ng/kg (Boehringer cohort, Germany). The mean serum concentration across the Australian population was determined as 10.9 ng WHO-TEQ/kg on a lipid-adjusted basis (range: 4.6-28 ng WHO-TEQ/kg lipid). Thus, the workers in the industrial cohorts studied were exposed to TCDD levels two to three orders of magnitude higher than those experienced by the Australian population

The exposure of Australians to dioxins may also be compared to the levels required to cause tumours in laboratory animal studies. In 2001 the Joint FAO/WHO Expert Committee on Food additives (JECFA) noted that in a long-term carcinogenicity study in rats in which the incidence of liver tumours was increased over that in controls, the LOEL of 10 ng/kg bw/day for TCDD corresponded to a steady-state body burden of 290 ng/kg bw/day. In order for humans to attain a similar steady-state body burden, they would have to have a daily intake of 150 pg/kg bw (FAO/WHO, 2002), equivalent to 4,500 pg/kg bw per month. As estimated above, the upper bound mean total dioxin intakes by young children (1-4 years of age) and adults in Australia were 37.5 and 15.6 pg WHO-TEQ/ kg bw/month respectively. The margin of safety between these values is greater than immediately apparent if one takes into account the conclusion that rats are likely to be somewhat more sensitive than humans to the carcinogenic effects of TCDD (see 'Hazard Assessment' at Section 2) and the fact that the human intake is expressed as WHO-TEQ (total dioxin-like compounds) while the rats study was conducted using the most potent dioxin, TCDD.

As discussed in Section 2 ('Hazard Assessment') the Tolerable Monthly Intake value established on the basis of non-cancer effects is sufficiently protective to guard against any carcinogenic risk. This conclusion has been reached by the JECFA, the EC-SCF, the US SAB Panel, and other independent risk assessors.

## 4.2 Health Risks for Specific Population Sub-Groups

### 4.2.1 Breast-fed infants

As noted in Section 3.2.3, since infants have a high dietary intake and low bodyweight, they have higher exposures to food contaminants per kilogram of body weight than adults. Since human breast milk generally contains higher dioxin levels than infant formulas (which are based on plant-derived oils rather than animal fats), there are some concerns about breast-fed infants receiving a higher intake of dioxin-like compounds than formula-fed infants. However, data assessed in Section 3.2.3 indicate that, compared with intake estimates for breast-fed infants from other countries, estimates of intakes by Australian infants were the lowest amongst those countries for which data were retrieved.

Notwithstanding this, it is noted that during the breast-feeding period, absolute intake of dioxins is likely to be higher in breast-fed infants than formula-fed infants[27], while the

[27] A peer-review comment was that the breast milk comparison should be with "low levels/natural levels" in breast milk rather than with levels in formula. The difficulty arises in ascertaining what is a "natural"

estimated intake per kg bodyweight is clearly likely to be higher than dietary intakes of dioxins for the rest of the Australian population. Available evidence does suggest, however, that dioxin intake for breast-fed infants diminishes over time. This can be explained by the observations that the dioxin concentration in maternal milk decreases during lactation, that the excretion rate of dioxins is higher in infants than in adults, and the fact that food intake per unit body weight and per unit total body fat decreases with age (attributed to the rapidly increasing body weight and lipid volume of the growing infant).

At issue is whether there are likely to be any developmental consequences of a period of somewhat higher exposure to dioxin-like compounds during breast feeding as cf. formula-fed infants. In order to help answer this question, a number of studies have been conducted.

A 1997 Dutch review (Cuijpers et al, 1997) of four epidemiological studies published between 1984 and 1996 (referred to as the Michigan study, the Rotterdam/Groningen study, the Amsterdam study, and the North-Carolina study) led the reviewers to conclude that these studies did not indicate any adverse effect of postnatal exposure *via* mother's milk to dioxins, furans and PCBs on the postnatal development of children. While the authors of the reviewed studies suggested that neurotoxic effects in children exposed to relatively high prenatal levels of dioxins could not be excluded, Cuipers and co-authors opined that this conclusion remained to be demonstrated. At best, the results of the epidemiological studies served a function in the identification of possible hazards of dioxins but could not be used for any quantitative risk assessment purposes.

A large prospective follow-up study, the "Dutch PCB/Dioxin Study" was initiated in 1989. In 1993, this study became part of a multi-centre cohort study with Germany and Denmark, financed by the European Community. Of 418 'healthy' mother-infant pairs, fifty percent (n = 209) of the children were breast-fed and 50% were formula-fed during infancy. The cohort was also fairly evenly divided in location between a highly industrialised area and a semi-urban area. Subjects were followed from birth until 6 years of age. The primary goal of this study was to gain insight into possible toxic effects associated with environmental PCB and dioxin exposure and the contribution of prenatal *vs* postnatal exposure to neurobehavioural and cognitive outcomes (Patandin, 2001).

In considering the numerous papers published as a result of the Dutch PCB/Dioxin Study, it needs to be borne in mind that 'prenatal' exposure refers to direct transfer of dioxins to the developing foetus from the mother whereas 'postnatal' exposure refers to post-partum transfer *via* breast milk; thus both breast-fed and formula fed babies have equivalent prenatal exposures to dioxin-like compounds. Because of the fact that quite subtle developmental changes are being studied and because it may not have been possible to distinguish between pre- or postnatal exposures, some of the published findings from the Dutch PCB/Dioxin Study (see below) report on effects of peri-natal

---

level; because of the limited numbers of samples taken, pooling of samples, and limited stratification of samples, no such samples could be clearly identified in this current study. Furthermore, it should be noted that no significant differences in dioxin levels were noted between rural, urban and industrialised urban areas in Australia.

exposure (exposure 'around' the time of birth) rather than specific pre- or post-birth exposures.

Prenatal PCB exposure was related to lower psychomotor scores at 7 months of age, poorer neurological condition at birth and at 18 months. At 42 months, prenatal PCB exposure was related to lower scores on the Kaufman Assessment Battery for Children, but no effect on the neurological condition was seen. Postnatal PCB and dioxin exposure through lactation was related to lower psychomotor development at 7 months (Vreugdenhil & Weisglas-Kuperus, 2000). Yet, in an assessment of play behaviour is school-age children, Vreugdenhil et al (2002b) reported more feminized play in boys as well as girls to be associated with higher prenatal dioxin levels, not with postnatal exposure to dioxin and PCBs through breast feeding.

Boersma and Lanting (2000) and Boersma et al (2001) investigated long-term effects of perinatal exposure to PCBs and dioxins on neurological and cognitive development in these infants from birth to 6 years of age. Data obtained suggested that prenatal exposure to PCBs may have subtle negative effects on early neurological and cognitive development of children but there were consistently beneficial effects of breast-feeding on brain development when children were studied from 18 months up to school age. Various possible mechanisms to explain the ability of breast feeding to counteract adverse developmental effects were suggested, including the transfer of hormones and biologically-active peptides, various long-chain fatty acids found in human milk which are important in supporting brain growth and development, as well as the psychosocial aspects of nursing. In a related component of the study which assessed the cognitive and motor abilities of school-age children using the McCarthy Scales of Children's Abilities, the authors (Vreugendhil et al, 2002) concluded that subtle cognitive and motor developmental delays from prenatal (perinatal?) PCB and dioxin exposure may persist into school age "when parental and home characteristics were less optimal", but such effects were not measurable in children raised in more optimal environments. That is, the intellectual stimulation provided by a more advantageous parental and home environment appeared to counteract any possible effects of prenatal exposure to PCBs and dioxins on cognitive and motor abilities. (Note that while half of this population was fully breast-fed for at least 6 weeks and the other half formula fed during infancy, the study focussed on linking effects to prenatal exposure.)

Weisglas-Kuperus et al (2000) suggested that prenatal exposure to PCBs and dioxins is associated with changes in the T-cell lymphocyte population in healthy Dutch infants, concluding that in Dutch preschool children the effects of perinatal background exposure to PCBs might be associated with a greater susceptibility to infectious diseases. However, the authors also hypothesized that this might lead to a lower prevalence of allergic diseases.

As appears to be the case in the Dutch PCB/Dioxin Study, a number of other studies (eg. Gladen et al, 1988; Jacobson et al, 1990; Huisman et al, 1995) also indicate that any neurological deficits associated with exposure to dioxins and other organochlorine contaminants appears to be associated with *in utero* exposure rather than breastfeeding, in spite of the higher doses received postnatally through breast milk than transplacentally.

A program established by the Japanese Ministry of Health and Welfare measured concentrations of dioxins in breast milk samples collected in Osaka over a 23-year period between 1973 - 1996 showed a decrease of approximately 50% in the level of dioxin-like compounds in the fat. It was reported that there were no changes in the health status of Japanese infants over this period (Hirayama, 2000). However, such a broad conclusion does not add significant information to the debate about effects of perinatal exposure of infants to dioxins.

Tsutsumi et al (2000) studied a cohort of Japanese females of reproductive age (2,281 control subjects and 567 patients with endometriosis) and reported that females who had been breast-fed had a lower incidence of endometriosis in adult life than non breast-fed infants. This unexpected finding led them to conclude that, if dioxin exposure was partly responsible for an increased incidence of endometriosis in women, it was not due to dioxin exposure during the breast-feeding period.

In two episodes of epidemic poisoning in Japan and Taiwan (so-called Yusho and Yu-Cheng incidents, respectively), developmental effects in infants and children born to mothers who had been exposed to PCDFs and PCBs included a higher incidence of natal teeth and later, missing permanent teeth, delayed eruption of permanent teeth, and disturbed root development (Ikeda, 1996; Rogan et al, 1988). A Finnish study (Alaluusua et al, 1996) concluded that long breast feeding may increase the risk of mineralization defects in children, possibly because of environmental contaminants (not identified). Further investigations (Alaluusua et al, 1999) suggested that such defects occurred more often and were more severe in children who had been exposed to higher amounts of polychlorinated aromatic hydrocarbons than in those exposed to lower amounts. Another Finnish study on 34,457 infants born in 1997-2000 (Alaluusua et al, 2002) indicated that the prevailing levels of PCDD/Fs and PCBs appeared to be below the threshold to cause perinatal eruption of teeth.
More recently, this Finnish research team has concluded that, despite findings that dioxins can have adverse effects on tooth development, breast feeding should not be restricted. This was made on the basis of observations that dioxin levels are declining and the fact that the benefits outweigh any possible risks (Alaluusua, 2004).

Hoover (1999) estimated the exposure of Canadian infants to persistent organochlorines in breast milk, using probabilistic methods. Although the levels of persistent compounds have been declining in Canadian breast milk, there were potential risks arising from exposure to dioxins, furans and PCBs. It was concluded that the well-documented benefits of breast-feeding qualitatively appeared to outweigh potential health concerns associated with organochlorine exposure. Furthermore, the risks of mortality from not breast-feeding as estimated by Rogan and colleagues (Rogan et al, 1991) exceeded any theoretical cancer risk estimated for infant exposure to potential carcinogens in Canadian breast milk. Rogan et al (1991) concluded that only extreme levels of contaminants could result in a greater health hazard than failure to breast feed. Thus, any recommendation to reduce or eliminate breast feeding would only be appropriate in isolated situations in which there was heavy exposure of the mother, such as might occur occupationally or from consumption of highly contaminated food (Rogan et al, 1991).

Despite evidence that breast-fed infants may initially have somewhat higher exposures to dioxin-like compounds than formula-fed infants, it has been widely concluded that, in addition to meeting nutritional needs, breast milk provides numerous immunological, developmental, psychological, economic, and practical advantages. Furthermore, a range of studies support the conclusion that breast-feeding may be related to the prevention of some adult-onset health problems such as diabetes and coronary heart disease. There are a large number of publications which catalogue specific benefits of breast feeding; some of these are outlined in the following Table.

**Table 4-1 Some reported health benefits of breast feeding**

| | |
|---|---|
| Morbidity and mortality | Protection against otitis media, bacteraemia, meningitis, diarrhoea, necrotizing enterocolitis, gastro-intestinal disorders, anaemia, eczema, respiratory and urinary tract infections, Sudden Infant Death Syndrome (SIDs), Crohn's disease, celiac disease and Type I diabetes |
| Neurological effects | Long-chain fatty acids in breast milk are essential for brain development; Breast-fed infants score higher in a variety of neurodevelopmental tests and are at a lower risk for learning disability; Exclusively breast-fed infants show more advanced psychological and psychomotor development at one year of age; Pre-term infants fed breast milk (even by tube-feeding) had better IQ outcomes at age 7-8; |
| Immunological effects | Breast-fed infants are protected against a variety of immune-related disorders including auto-immune diseases, food allergies and allergic dermatitis; Immune systems of breast-fed infants appear to mature more quickly; Immunological protection afforded by breast milk reduces the overall morbidity in breast-fed infants. |
| Physical development | Enhances the maturation of the neonatal intestinal tract. |
| Vision | Fatty acids in breast milk are important for optimal retinal development and visual function. |
| Psychological | Provides an opportunity for mother/infant bonding, with implications for emotional development and adult psychoaffective behaviour. |

Table adapted from Hoover (1999) and references therein.

The WHO estimated the percentage of lifetime intake of PCDD/Fs and PCBs that would be obtained from nursing and concluded that exposure is small in comparison to the benefits of breast feeding (WHO, 1988). After more recent extensive evaluation of the literature, the WHO has re-stated that current scientific evidence does not support altering its global public health recommendation of exclusive breast-feeding for 6 months, followed by safe and appropriate complementary foods, with continued breast-feeding, up to 2 years of age or beyond, as appropriate (Pronczuk et al, 2002). Nevertheless, it has also stated that further efforts to control environmental releases of these compounds is warranted, based on results of epidemiological studies showing the possibility of subtle clinical, endocrine and neurodevelopmental effects, in conjunction with related data obtained in experimental animals (Brouwer et al, 1998; AMAP 2003).

In conclusion, breast-fed infants are likely to have an intake of dioxins over the breast-feeding period which is somewhat higher than in formula-fed infants. However, by far the majority of evidence in the scientific literature suggests that any short-term adverse effects of this intake are far outweighed by the beneficial effects of breast feeding.

### 4.2.2 Workers exposed to chlorinated pesticides

Occupational exposure to the herbicide 2,4,5-T (2,4,5-trichlorophenoxyacetic acid) contaminated with TCDD is considered in some detail in Section 3.6.2. It appears that some heavily contaminated 2,4,5-T may have been illegally imported from about 1969 to 1971 and used in a government weed control program undertaken by the Agriculture Protection Board (APB) from 1975 to 1985, in the Kimberleys and other regions of WA. An inquiry was conducted by the Parliament of Western Australia; the final report of The Expert Medical Panel to Evaluate Recommendations of the Kimberley Chemical Use Review (made public on 27th February 2004; accessed via http://www.ministers.wa.gov.au) concluded that the cohort of APB workers examined may have experienced a somewhat higher incidence of cancer than the community overall, although the results were not statistically significant. Other signs and symptoms of ill health that the APB workers reported did not appear to be caused by their exposure to herbicides during their employment in the spray program. Thus, no cases of chloracne were reported to have been diagnosed (a condition which indicates exposure). Symptoms of anxiety and depression reported by the APB workers were no more prevalent than in the general community. For diabetes, possibly associated with exposure to dioxins (see Section 2), the expected diabetes-related death rate in the indigenous referent population was greater than that observed in APB workers. Further, there was no strong evidence to suggest that mortality in APB workers was higher than in the general Kimberley population. It is not possible to comment further on any link between cancer incidence and exposure to dioxins in this case, since no survey of serum dioxin levels has yet been conducted in APB workers involved in 2,4,5-T spraying programs. The results of such a survey, if performed, could indicate whether these workers had significantly higher historical exposures to dioxins than a control population. Thus, the available information from this study does not allow any assessment to be made of the likely increase in cancer risk from a given exposure to dioxins.

2,4,5-T and 2,4-D were manufactured in Sydney for more than 25 years at the Union Carbide site at Rhodes. DDT was manufactured there for almost 40 years. Unfortunately, information about the health of these workers does not appear to be available. However, there is information available about the site – particularly dioxin levels.

The historical use of pentachlorophenol (PCP) in the timber industry in Australia to protect softwood timber from decay has most likely resulted in occupational exposure to PCDD and PCDFs for some timber workers. Whether or not they have experienced symptoms and health effects due to such exposures is unknown. Whilst there does not appear to be any evidence of significant long-term health effects from the use of PCP, the possibility of such effects cannot be excluded.

### 4.2.3 Cigarette smokers

Very approximate estimates (Section 3.6.3) indicate that intake of PCDD/Fs by the average smoker could be around 1/3rd of that coming from food. Thus, smokers are likely to have a measurably elevated dioxin intake cf. non-smokers, with the potential for an increased body burden of dioxins. Smokers place themselves at significant health

risk from the many other toxic and carcinogenic components present in cigarette smoke, a risk which far outweighs the risk from intake of this level of dioxins. However, it appears that encouraging people to give up smoking would help to reduce body burdens of dioxins in the 1/5$^{th}$ of the Australian population which smoke; in young women in particular, smoking has the potential to increase their tissue levels of dioxins which could ultimately transfer to any future offspring *via* prenatal (transplacental) and postnatal (breast feeding) routes.

Non-smokers are also likely to be exposed to dioxins from passive intake of cigarette smoke. However, because individual exposure to so-called 'sidestream' smoke is much more variable than the exposure of smokers themselves, it is not feasible to reasonably estimate the extra contribution of inhaled sidestream smoke to dioxin intake *via* the lungs.

### 4.2.4 Subsistence and recreational fishermen

In Australia, indigenous populations which may consume diets high in seafood are located in northern coastal areas away from key population centres. Thus the seafood that they consume is unlikely to present a significant dietary source of dioxin-like compounds.

In considering the intake of recreational fishermen based in larger population centres, the typical dioxin concentrations in seafood and typical rates of consumption have been included in the dietary intake assessment conducted by FSANZ (see Section 3.2.1). The kinds of exposures likely to occur in Australian waters are addressed within the estimates of variability of the levels of dioxin-like compounds found, and are not considered to be likely to result in a population subgroup which would be significantly more exposed than the general population. Except in a place like Homebush Bay where the fish are significantly more contaminated due to the contamination of sediments resulting from the manufacture of 2,4,5-T. The sediments of Homebush Bay and the land where the chemicals were manufactured is about to be remediated. Currently, there is a ban on all types of fishing in the area to try and ensure that people don't get exposed to these fish that have significant levels of dioxins.

### 4.2.5 Indigenous populations

The Aboriginal and Torres Strait Islander population in Australia tends not to have a high intake of animal fats from wild-caught game, including land animals (kangaroos, wallabies, lizards etc) and marine species (eg. dugongs, turtles and crocodiles). Overall, indigenous diets would not generally rely more heavily on animal fats than the rest of the Australian population (advice from the Population Health Division of the Australian Department of Health and Ageing). In Australia with its temperate, tropical and hot climatic zones, the contamination of native Australian animals which may be food sources for the aboriginal population is not a significant problem cf. levels of persistent organic pollutants (including dioxins) found in the extensive fat stores of arctic mammals e.g. seals and polar bears. This arctic contamination arises from the trans-boundary migration of POPs in the northern hemisphere, with their volatilisation from tropical and temperate climate zones and subsequent precipitation in the polar zone of the Arctic Circle. An ecological risk assessment of dioxins in Australia (Gatehouse,

2004) also noted that only low levels of dioxins were found in Australian fauna, this being particularly so in low-trophic-level herbivores and in marine mammals living in the open ocean environments of this continent.

# 5. Recommendations

Although hundreds of epidemiology studies have looked at the human health effects of dioxin exposures, neither the full extent of dioxin contamination nor the magnitude of the associated human health risks are clearly understood (eg. Institute of Medicine, 2004). Because of this, and in the light of increasing scientific knowledge about the biological actions and effects of dioxin-like compounds, it would be prudent to continue efforts to reduce any potential risks to human health. Thus, a cautious and conservative approach should be adopted with respect to dioxin-like compounds.

## 5.1 Some Specific Risk Management Recommendations

The following are some suggested specific measures to help reduce population body-burdens of dioxins.

- Programs which have been introduced to reduce the release of dioxin-like compounds to the environment need to be on going.

- Ways to block the cycling of dioxins through the food supply need to be identified. Reducing the level of dioxins in feed given to livestock, poultry and aquaculture fish will help to reduce the levels of dioxins in the food supply. This may be achieved by reducing the amount of animal fat used as a growth enhancer in stockfeed, and sourcing fish-based aquaculture feed (eg. pilchards, sardines) from non-polluted environments.

- Since foods high in animal fats are a source of exposure to these chemicals, current efforts to promote lower saturated fat intake in the population should continue[28].

- The utility and feasibility of setting Maximum Limits (MLs), action levels and target values for dioxin-like compounds in those food groups which contribute most to the human body burden of dioxins could be considered by the health, food and agriculture portfolios. Exceeding action thresholds, if set, would instigate efforts to identify sources of contamination, whilst target values would be set lower than current average background levels.

- Current programs to discourage cigarette smoking should be maintained. In particular, any measures which reduce dioxin intake in young women are likely to help reduce their body burden of dioxins and ultimately, the amount of dioxins

[28] Note that the relative specific heath risks of exposure to dioxins are low compared to those arising from a high intake of saturated fats

which may be transferred to their offspring, both prenatally (*via* trans-placental transfer) and postnatally *via* breast milk[29].

- The population burden of dioxin-like compounds should be monitored periodically, to see whether risk reduction strategies are effective.

Note that these recommendations are preliminary risk management recommendations made by the Office of Chemical Safety and they will be further developed following discussions with other government agencies and consideration of public input.

[29] As for dietary intake of saturated fats, the specific health risks associated with dioxin exposure are low compared to the known adverse effects of smoking. This could be an area for further investigation eg. to ascertain whether smokers have higher body burdens of dioxins cf. matched controls.

# Appendices

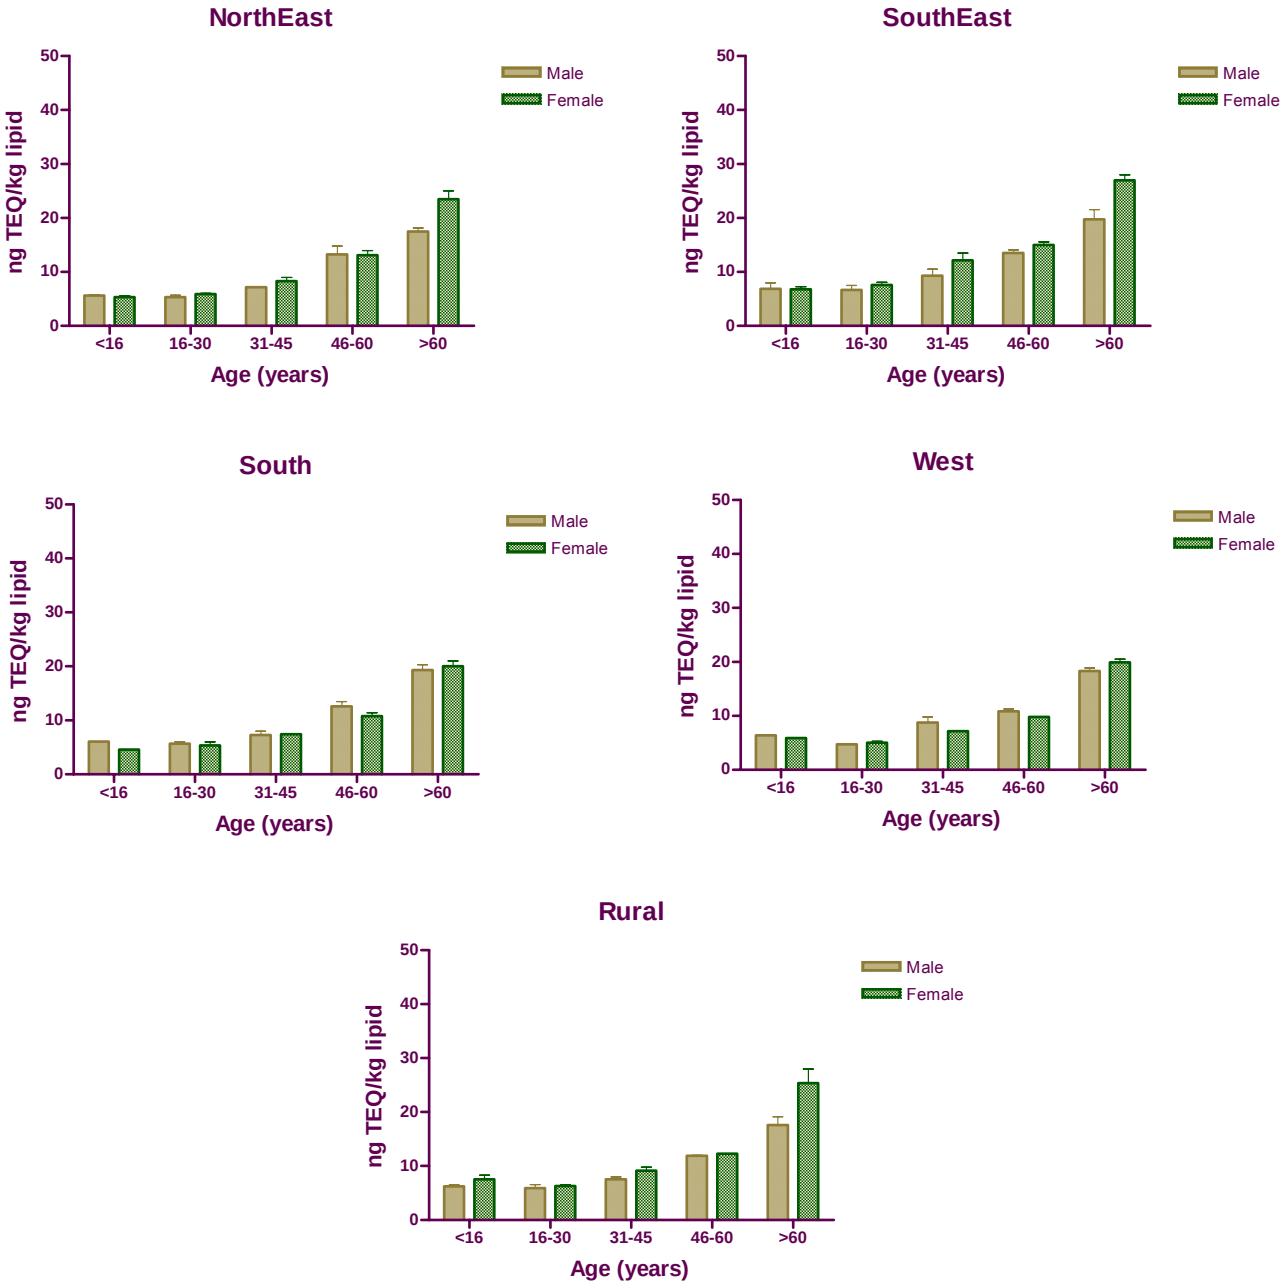
## Appendix 1 Acronyms and Abbreviations

| | |
|---|---|
| ALDE | Average Lifetime Daily Exposure |
| ATSDR | Agency for Toxic Substances and Disease Registry |
| BMI | Body Mass Index |
| DAFF | Australian Department of Agriculture, Fisheries & Forestry (formerly Agriculture, Fisheries & Forestry Australia, or AFFA) |
| bw | bodyweight |
| CAC | Codex Alimentarius Commission |
| CI | Confidence Interval |
| COT | UK Department of Health's Committee on the Toxicity of Chemicals in Food, Consumer Products, and the Environment |
| DEH | Australian Government Department of the Environment and Heritage (formerly 'Environment Australia', or EA) |
| DoHA | Australian Government Department of Health and Ageing |
| DRRS | The Dioxin Reassessment Review Subcommittee of the Executive Committee of US EPA's Science Advisory Board |
| EC | European Commission |
| EC-SCF | EC-Scientific Committee on Food |
| EHDI | estimated human daily intake |
| EHMI | estimated human monthly intake |
| FAO | Food and Agriculture Organization of the United Nations |
| FSANZ | Food Standards Australia New Zealand |
| GD | gestational day |
| IARC | International Agency for Research on Cancer |
| IC3 | indole-3-carbinol |
| IgG | immunoglobulin G |
| ILO | International Labour Organization |
| IPCS | International Programme on Chemical Safety |
| I-TEQ | international toxic equivalence |
| JECFA | Joint Expert Committee on Food Additives |
| LO(A)EL | lowest observable (adverse) effect level |
| LOD | Limit of Detection |
| LOQ | Limit of Quantification (or Quantitation) |
| μg | microgram; $10^{-6}$ grams |
| MRL | minimal risk levels; also maximum residue limit |
| mRNA | messenger ribonucleic acid |
| ng | nanogram; $10^{-9}$ grams |
| NHMRC | National Health & Medical Research Council |

| | |
|---|---|
| NICNAS | National Industrial Chemicals Notification and Assessment Scheme |
| NIOSH | US National Institute for Occupational Safety and Health |
| NO(A)EL | no observable (adverse) effect level |
| OCS | Office of Chemical Safety, DoHA |
| OR | odds ratio |
| PAHs | polyaromatic hydrocarbons |
| PBDDs | polybrominated dibenzo-*p*-dioxins |
| PBDFs | polybrominated dibenzofurans |
| PCBs | polychlorinated biphenyls |
| PCDDs | polychlorinated dibenzo-*p*-dioxins |
| PCDFs | polychlorinated dibenzofurans |
| pg | picogram; $10^{-12}$ grams |
| ppt | parts per trillion (one in a million million, or $10^{-12}$) |
| PTMI | provisional tolerable monthly intake |
| RfD | reference dose |
| SAB | US EPA's Science Advisory Board |
| RR | relative risk |
| SMR | standardised mortality ratio |
| TCDD | 2,3,7,8-tetrachloro-dibenzo-p-dioxin |
| TDI | tolerable daily intake |
| TEF | toxic equivalency factors |
| TEQ | toxic equivalence |
| TGA | Therapeutic Goods Administration |
| TMI | tolerable monthly intake |
| TWI | tolerable weekly intake |
| UNEP | United Nations Environment Programme |
| US EPA | United States Environmental Protection Agency |
| WHO | World Health Organization |
| WHO-ECEH | European Centre for Environmental Health |

# Appendix 2 Mean total WHO-TEQ (PCDD/Fs plus PCBs) in the serum of a representative group of the Australian population by age group, sex and region.

Data shown represent average upper bound WHO-TEQ values for pooled samples across 5 regions obtained for males and females from the 5 age groups.



## Appendix 3 PCB loadings[30] for PCB #126 and PCB #169 for a representative sample of the Australian population.

| | | PCB Loading | | | | |
|---|---|---|---|---|---|---|
| | | <16 years | 16-30 years | 31-45 years | 46-60 years | >60 years |
| South, Females | 3,3',4,4',5-PeCB (126) | 64.29% | 56.25% | 42.97% | 42.19% | 40.16% |
| | 3,3',4,4',5,5'-HxCB (169) | 2.57% | 2.66% | 3.78% | 4.06% | 3.77% |
| South, Males | 3,3',4,4',5-PeCB (126) | 73.33% | 57.89% | 41.46% | 30.77% | 34.92% |
| | 3,3',4,4',5,5'-HxCB (169) | 3.33% | 3.79% | 4.93% | 4.74% | 4.60% |
| RURAL, Females | 3,3',4,4',5-PeCB (126) | 64.86% | 75.00% | 50.00% | 39.08% | 41.62% |
| | 3,3',4,4',5,5'-HxCB (169) | 1.43% | 1.54% | 2.84% | 3.45% | 2.79% |
| RURAL, Males | 3,3',4,4',5-PeCB (126) | 56.10% | 56.10% | 44.68% | 37.08% | 39.04% |
| | 3,3',4,4',5,5'-HxCB (169) | 2.32% | 2.88% | 4.00% | 3.71% | 3.22% |
| North East, Females | 3,3',4,4',5-PeCB (126) | 67.50% | 61.54% | 44.00% | 26.41% | 36.65% |
| | 3,3',4,4',5,5'-HxCB (169) | 2.10% | 2.33% | 3.14% | 3.72% | 2.46% |
| North East, Males | 3,3',4,4',5-PeCB (126) | 64.71% | 55.56% | 38.60% | 28.71% | 36.36% |
| | 3,3',4,4',5,5'-HxCB (169) | 2.88% | 3.42% | 4.40% | 3.66% | 3.36% |
| West, female | 3,3',4,4',5-PeCB (126) | 75.00% | 52.86% | 44.55% | 35.48% | 45.74% |
| | 3,3',4,4',5,5'-HxCB (169) | 2.56% | 3.50% | 4.32% | 5.00% | 3.80% |
| West, male | 3,3',4,4',5-PeCB (126) | 52.63% | 57.58% | 39.80% | 35.80% | 42.34% |
| | 3,3',4,4',5,5'-HxCB (169) | 3.84% | 4.30% | 5.69% | 5.31% | 4.53% |
| South East, females | 3,3',4,4',5-PeCB (126) | 77.33% | 74.70% | 57.03% | 55.63% | 50.91% |
| | 3,3',4,4',5,5'-HxCB (169) | 1.35% | 1.69% | 1.80% | 2.25% | 1.95% |
| South East, males | 3,3',4,4',5-PeCB (126) | 60.00% | 55.77% | 51.90% | 42.02% | 40.91% |
| | 3,3',4,4',5,5'-HxCB (169) | 2.44% | 3.54% | 3.67% | 3.70% | 3.18% |

[30] PCB loadings is defined as the serum concentration (WHO-TEQ pg/g lipid) divided by the total PCB WHO-TEQ.

# Appendix 5 The differences in geographical stratification and population (000s) between the two different dietary surveys NNS (1995) and NHS (2001).

**National Health Survey (NHS, 2001)**

| Geographical stratification | | Age (years) & population (000s) | | | |
|---|---|---|---|---|---|
| STUDY | SURVEY | 16-30 | 31-45 | 45-60 | >60 |
| NORTHEAST URBAN | MAJOR URBAN QLD | 198-201 | 198-201 | 147-157 | 119-132 |
| Southeast Urban | Major urban NSW/ACT | 503-507 | 500-501 | 395-419 | 282-338 |
| South Urban | Major urban VIC/TAS/SA | 440-444 | 467-479 | 370-371 | 305-370 |
| West Urban | Major Urban WA | 119-121 | 125-129 | 109-129 | 109-119 |
| Rural | Rural balance all states and territories | 508-565 | 621-692 | 476-580 | 491-508 |

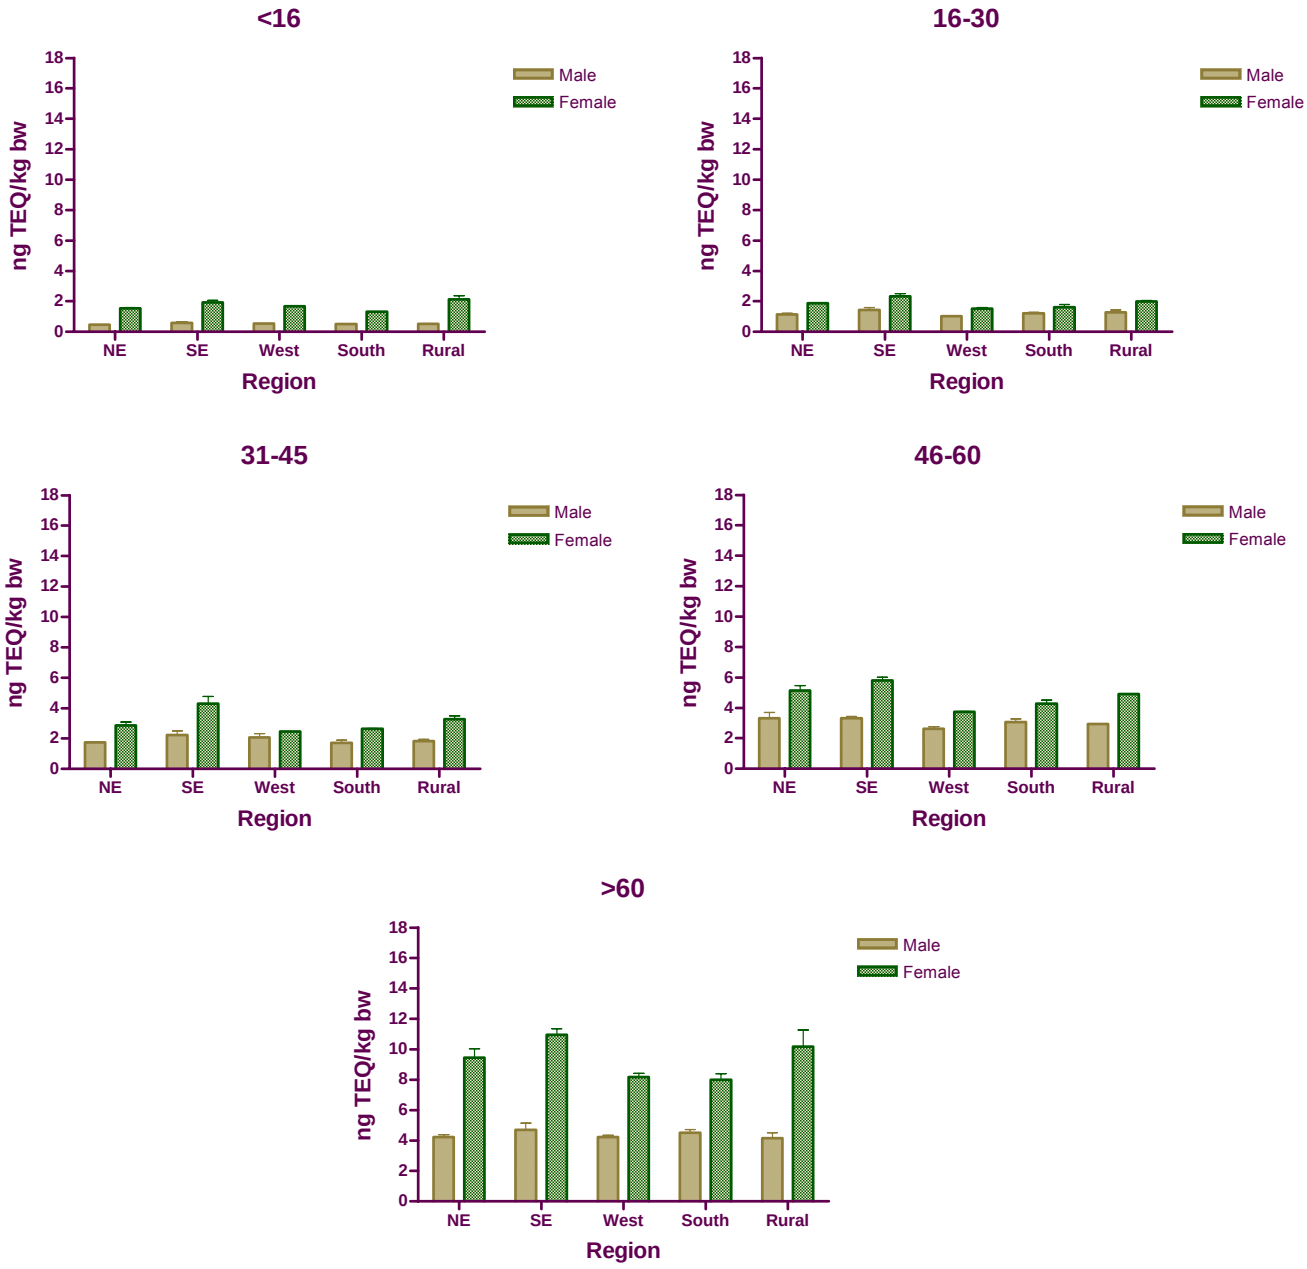
Major urban is classified as urban areas with a population > 100000

**National Nutrition Survey (NNS, 1995)**

| Geographical stratification | | Age (years) & population (000s) |
|---|---|---|
| STUDY | SURVEY | <16 |
| NORTHEAST URBAN | METRO QLD | 47-51 |
| Southeast Urban | Metro NSW/ACT | 110-117 |
| South Urban | Metro VIC/TAS/SA | 114-140 |
| West Urban | Metro WA | 39-47 |
| Rural | Rural and NT | 172-177 |

# Appendix 6 Mean total PCDD/Fs and PCBs body burden of a representative group of the Australian population by age, sex and region.

Data shown represent average body burden values for pooled samples across 5 regions obtained for males and females from the 5 age groups.



# Appendix 7 Upper bound blood serum concentrations, body burden and ALDE for PCDD/Fs, PCBs and total dioxins (PCCDD/Fs plus PCBs) for a representative sample of the Australian population by age group, sex and region.

TMI = 70 pg TEQ/kg bw/month
Total dioxins = sum of intakes of PCDD/Fs and PCBs. Total dioxins may not equal the sum of the separate intakes due to rounding.
Estimated dietary exposures are based on food consumption data from the 1995 NNS

# Appendix 13 Percent contribution of food groups to PCDD/F mean dietary exposures for each population group

| Food Name | 9 months | 2+ years | | | 2-4 years | 4-15 years | | 16-29 years | | 30-44 years | | 45-59 years | | 60+ years | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | All | All | Males | Females | All | Males | Females | Males | Females | Males | Females | Males | Females | Males | Females |
| Fish fillets, including crustacea and molluscs | 6 | 39 | 40 | 38 | 18 | 26 | 24 | 35 | 35 | 45 | 39 | 44 | 46 | 47 | 44 |
| Milk (full fat) including cheese, icecream and infant dessert | 10 | 31 | 30 | 33 | 55 | 45 | 44 | 33 | 35 | 25 | 31 | 25 | 28 | 24 | 29 |
| Bacon | 1 | 7 | 8 | 6 | 2 | 5 | 6 | 9 | 7 | 8 | 7 | 7 | 7 | 8 | 6 |
| White bread, including all cereal products | 2 | 4 | 4 | 4 | 5 | 5 | 5 | 4 | 5 | 4 | 5 | 4 | 4 | 4 | 4 |
| Peanut butter | 0 | 4 | 5 | 4 | 8 | 5 | 7 | 4 | 5 | 5 | 4 | 5 | 3 | 3 | 3 |
| Potatoes, including all vegetables | 1 | 3 | 3 | 4 | 2 | 2 | 3 | 3 | 3 | 3 | 4 | 3 | 4 | 3 | 4 |
| Butter | 0 | 2 | 2 | 2 | 1 | 1 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 3 | 3 |
| Beef, minced | 0 | 2 | 2 | 2 | 1 | 1 | 1 | 2 | 2 | 2 | 2 | 2 | 1 | 2 | 1 |
| Eggs | 0 | 2 | 2 | 2 | 1 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |
| Milk chocolate | 1 | 1 | 1 | 1 | 2 | 2 | 3 | 2 | 2 | 1 | 2 | 1 | 1 | 0 | 1 |
| Chicken breasts | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 1 | 1 | 1 | 1 | 1 |
| Sausages, meat, thick | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Margarine, table spread | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| Infant formula | 78 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Percentage food contributions to PCDD/F and PCB exposure based on ‘lower bound’ values.

# Appendix 14 Percent contribution of food groups to PCB mean dietary exposures for each population group

| Food Name | 9 months | 2+ years | | | 2-4 years | 4-15 years | | 16-29 years | | 30-44 years | | 45-59 years | | 60+ years | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | All | All | Males | Females | All | Males | Females | Males | Females | Males | Females | Males | Females | Males | Females |
| Fish fillets, including crustacea and molluscs | 26 | 72 | 73 | 71 | 49 | 60 | 57 | 68 | 68 | 76 | 72 | 75 | 77 | 78 | 76 |
| Milk (full fat) including cheese, icecream and infant dessert | 4 | 11 | 11 | 12 | 30 | 21 | 21 | 13 | 13 | 9 | 11 | 8 | 9 | 8 | 10 |
| Beef, minced | 1 | 3 | 3 | 3 | 2 | 3 | 3 | 4 | 3 | 3 | 3 | 3 | 2 | 3 | 2 |

# Appendix 17 Formulae and Assumptions Used in Estimating the Intake and Systemic Exposure to Dioxins from Soil

Intake from ingestion of soil was calculated according to following formula:

$$\frac{\text{Dioxin concentration in soil x amount of soil ingested/day x 30}}{\text{Body weight}}$$

Systemic exposure from ingestion of soil was calculated according to following formula:

$$\frac{\text{Dioxin concentration in soil x amount of soil ingested/day x fraction absorbed x 30}}{\text{Body weight}}$$

For both the intake and systemic exposures, the amount of soil ingested was assumed to be 100 mg/day for child (1-5 years old) and 25 mg/day for adult. Body weights used were 15 kg for a 3 year old child and 70 kg for an adult (EnHealth, 2003; EnHealth, 2002; US EPA, 2002). The fraction of dioxins absorbed from soil was taken as 0.5, which was considered appropriate on the basis of results reported in animal and *in vitro* studies (Shu et al, 1988, Ruby et al, 2002)

Monthly systemic exposure from dermal contact with soil was estimated according to the following formula:

$$\frac{\text{Dioxin concentration in soil x area of exposed skin x dermal adherence x fraction absorbed x 30}}{\text{Body weight}}$$

Body weights used were as outlined above. Areas of exposed skin used were:
Child 1992 $cm^2$ =30% of total skin surface area (EnHealth, 2003; US EPA, 2002)
Adult 4700 $cm^2$ =24% of total skin surface area (EnHealth, 2003)

Since the draft Australian Exposure Assessment Handbook lacks dermal adherence factors for both children and adults, the dermal adherence factors used were 0.2 $mg/cm^2$ for a child and 0.07 $mg/cm^2$ for an adult (US EPA, 2001b). The fraction of PCDD/Fs absorbed was 0.03 and the fraction of PCBs absorbed through the skin was 0.14 (US EPA, 2001b). It was also assumed that dermal contact with soils occurred to the same extent every day of the year over a lifetime.

# Appendix 18 Estimated monthly dietary exposures to PCDD/F, PCBs and total dioxins, as a percentage of the TMI.

| Sex | Age group | PCDD/F (% TMI) | | PCBs (% TMI) | | Total Dioxins (% TMI) | |
|---|---|---|---|---|---|---|---|
| | | Lower Bound | Upper Bound | Lower Bound | Upper Bound | Lower Bound | Upper Bound |
| All | 2+ | 1 | 15 | 4 | 8 | 5 | 22 |
| Males | 2+ | 1 | 16 | 4 | 8 | 6 | 24 |
| Females | 2+ | 1 | 14 | 4 | 7 | 5 | 21 |
| Infants | 9 months | 7 | 77 | 10 | 17 | 17 | 87 |
| Toddlers | 2-4 | 3 | 36 | 6 | 17 | 9 | 52 |
| Males | 4-15 | 2 | 25 | 5 | 12 | 7 | 37 |
| Females | 4-15 | 2 | 21 | 4 | 10 | 6 | 31 |
| Males | 16-29 | 1 | 15 | 4 | 8 | 6 | 23 |
| Females | 16-29 | 1 | 13 | 3 | 7 | 4 | 19 |
| Males | 30-44 | 1 | 13 | 5 | 8 | 6 | 21 |
| Females | 30-44 | 1 | 11 | 3 | 6 | 4 | 18 |
| Males | 45-59 | 1 | 12 | 4 | 7 | 5 | 19 |
| Females | 45-59 | 1 | 11 | 4 | 6 | 5 | 17 |
| Males | 60+ | 1 | 11 | 4 | 7 | 5 | 18 |
| Females | 60+ | 1 | 11 | 3 | 6 | 4 | 17 |

TMI = 70 pg TEQ/kg bw/month

Total dioxins = sum of intakes of PCDD/F and PCBs. Total dioxins may not equal the sum of the separate intakes due to rounding.

## 95th percentile dietary exposure to dioxins as a percentage of the TMI

| Sex | Age group | PCDD/F (% TMI) | | PCBs (% TMI) | | Total Dioxins (% TMI) | |
|---|---|---|---|---|---|---|---|
| | | Lower Bound | Upper Bound | Lower Bound | Upper Bound | Lower Bound | Upper Bound |
| All | 2+ | 4 | 34 | 19 | 24 | 23 | 58 |
| Males | 2+ | 5 | 36 | 21 | 26 | 25 | 62 |
| Females | 2+ | 4 | 32 | 17 | 23 | 21 | 55 |
| Toddlers | 2-4 | 6 | 62 | 11 | 32 | 17 | 95 |
| Males | 4-15 | 5 | 47 | 12 | 27 | 17 | 74 |
| Females | 4-15 | 5 | 41 | 12 | 25 | 17 | 66 |
| Males | 16-29 | 5 | 30 | 23 | 27 | 28 | 57 |
| Females | 16-29 | 3 | 25 | 15 | 19 | 18 | 44 |
| Males | 30-44 | 4 | 26 | 22 | 25 | 26 | 51 |
| Females | 30-44 | 3 | 23 | 13 | 17 | 16 | 40 |
| Males | 45-59 | 4 | 24 | 21 | 24 | 25 | 47 |
| Females | 45-59 | 4 | 21 | 22 | 25 | 26 | 46 |
| Males | 60+ | 4 | 21 | 24 | 27 | 28 | 48 |
| Females | 60+ | 3 | 21 | 18 | 20 | 21 | 41 |

TMI = 70 pg TEQ/kg bw/month
Total dioxins = sum of intakes of dioxins-furans and PCBs. Total dioxins may not equal the sum of the separate intakes due to rounding.
Estimated dietary exposures are based on food consumption data from the 1995 NNS
Infant estimated dietary exposures are based on a constructed infant diet (see Section 3.2.2).

# National Dioxins Program - National Action Plan for addressing Dioxins in Australia

October 2005

Environment Protection and Heritage Council

**NOTE**

This National Action Plan has been developed by a Project Team of government officers, at the request of the Environment Protection and Heritage Council. The views and opinions expressed in this publication do not necessarily reflect those of any members or member government of the Environment Protection and Heritage Council.

# PREFACE

At its 11th meeting on 1 July 2005, the Environment Protection and Heritage Council (EPHC) agreed to release the draft *National Action Plan for Addressing Dioxins in Australia* for an eight-week public comment period.

Fourteen submissions were received and taken into consideration in preparing a revised Plan. A summary of the comments provided is included in Appendix 2.

The EPHC has agreed that this revised Action Plan will be the guiding document for addressing dioxins in Australia. The plan will be implemented in consultation with other ministerial councils with an interest in dioxins including Food Regulation, Primary Industries and Health.

The Action Plan will contribute towards meeting Australia's obligations in relation to reducing dioxin releases as required under Article 5 of the Stockholm Convention. The Action Plan will become part of Australia's National Implementation Plan (NIP) which will set out how we will meet broader obligations under the Convention.

The plan will be amended from time to time to reflect international moves aimed at minimising, and where feasible, ultimate elimination of dioxin releases.

Further information about this plan should be made to:

# EXECUTIVE SUMMARY

This National Action Plan sets out a range of actions that will be taken by Australian governments to minimise, and where feasible, ultimate elimination of dioxin releases. The actions include:

**Air emissions**

- Governments to adopt or reaffirm 0.1 ng TEQ/$m^3$ as a guideline emission level for new combustion facilities and for existing combustion facilities when they are upgraded.
- Governments to use recommendations in the Stockholm Convention Best Available Techniques and Best Environmental Practices guidance for new facilities and for existing facilities when they are upgraded.
- Governments to continue with existing measures aimed at reducing particle emissions from domestic woodheaters including community education on the correct operating practices for woodheaters, seeking improvements to woodheater installation and emission standards, and sponsoring research to improve our understanding of woodheater emissions.
- The Australian Government to monitor overseas research looking at emissions of dioxins from diesel, LPG and CNG vehicles to determine whether further action is required in Australia.
- Australian Government to undertake further research on dioxin emissions from bushfires to provide firmer evidence of dioxins to help governments determine appropriate response measures, if any.
- The EPHC Air Toxics Working Group to utilise NDP Ambient Air study data when assessing the relative priority of dioxins, for possible inclusion in the Air Toxics NEPM.

**Soils**

- In the review of the Site Contamination NEPM during 2005/2006, consider including health-based investigation levels for dioxins. Investigation level for sites contaminated with dioxins may provide guidance which will lead to uniformity of site risk assessment. Consider the feasibility of a screening process for identifying sites where dioxins could be present.
- Governments to continue best efforts towards remediating sites contaminated with significant levels of dioxins and undertake this work in an environmentally sound manner.
- Australian Government to consider further research to improve our knowledge of natural dioxins formation, and the sources and exposure risks of dioxins in the soils of coastal eastern Australia.

**Water**

- Governments to consider including a level for dioxins in water when undertaking a future update of the Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000.

**Sediments**

- Governments to consider including a level for dioxins in sediments when undertaking a future update of the Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000.

**Sediments**

- Governments to consider including a level for dioxins in sediments when undertaking a future update of the Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000.

**Biota**

- Subject to resources, the Australian Government to give consideration to undertaking further studies of biota in order to assess whether source directed measures are having the desired effect in lowering dioxin levels in the environment.

**Wastes**

- Where information identifies environmental or human health risks from dioxins in water recycling and biosolids activities, governments to consider including a level for dioxins when undertaking a future update of the National Water Quality Management Strategy (NWQMS):
    - Guidelines for Water Recycling – Managing Health and Environmental Risks
    - Guidelines for Sewerage Systems – Biosolids Management
- Governments to consider including a level for dioxins when undertaking a review of the NWQMS Guidelines for Sewerage Systems: Acceptance of Trade Waste (Industrial Waste) 1994.
- Governments to take into account the Stockholm Convention Best Available Techniques and Best Environmental Practices guidance for production of pulp when new mills or modifications to existing mills are proposed.
- Governments to set a level for dioxins in fertilisers and industrial residues when applied to land for soil amelioration purposes.
- No further action required at this time to amend the level of dioxins and furans in re-refined base oil.
- Governments to continue the removal from use and destruction of scheduled wastes in accordance with the three plans under the National Strategy for the Management of Scheduled Waste.
- Governments to ensure that the Stockholm Convention guidance on Best Available Techniques and Best Environmental Practices is considered in selecting the process to treat the HCB waste so as to prevent or minimise the formation and release of dioxins.

**National Pollutant Inventory**

- Governments to consider reporting dioxins in toxic equivalents (TEQs) under the National Pollutant Inventory.

**Human intake**

- Governments to continue with existing programs that discourage cigarette smoking and promote lower saturated fat intake.
- Government to continue to promote the health benefits of exclusive breastfeeding to the age of six months, then the introduction of complementary foods and continued breastfeeding thereafter.

- Subject to resources, governments to consider periodically monitoring the population burden of dioxins in order to assess whether risk reduction strategies are having the desired effect in lowering dioxin levels in humans.

**Agricultural products**

- Subject to resources, Australian Government to give consideration to undertaking a study in ten years in order to ensure dioxin levels in livestock commodities remain within international and domestic standards.
- The Australian Government to work with Australian animal production industries to support implementation of voluntary measures to address hazards, including dioxins, in animal feeds.

**Food**

- Subject to resources, give consideration to undertaking a study in ten years to determine if dioxins levels in food have remained low.
- Consider setting maximum levels or generally expected levels for dioxins in food, should a future survey reveal that source-directed measures have been ineffective at reducing dioxin levels in foods.

**Other actions**

- The Australian Government to continue investigating possible legislative avenues with which it can address dioxins in the environment, as obliged under the Stockholm Convention.

# 1. BACKGROUND

## 1.1 National Dioxins Program

The Commonwealth Government provided $5 million over four years towards the National Dioxins Program (NDP), a program to improve our knowledge on dioxin levels in Australia and to determine the risk to both human health and the environment.

The NDP began in 2001 and is being implemented in three phases. Phase one involved gathering information about the current levels of dioxins in the Australian environment, community, food and levels of emissions. Studies under this part of the program began in July 2001 and were completed in 2004.

Phase two used the information gathered in the phase one studies to undertake a risk assessment to determine the potential risks of dioxins to the environment. An assessment was also made of the potential risks for human health from exposure to dioxins either directly from the environment or from dioxins in food. The findings of the studies and the risk assessments are contained in a series of twelve technical reports – see the Reference section for more details.

The final phase of the NDP is to implement appropriate measures aimed at reducing, and where feasible, eliminating the release of dioxins in Australia. This Action Plan outlines a range of actions to be implemented.

The Action Plan was released on 1 July 2005 for an eight-week public comment period ending on 26 August 2005 with fourteen submissions received from organisations and individuals.

## 1.2 What are dioxins?

The term "dioxins" describes a group of compounds that belong to the larger family of persistent organic pollutants. These compounds share similar chemical structures, properties and biological characteristics including toxicity. These compounds can accumulate in the body fat of animals and humans and tend to remain unchanged for long periods. Several hundred of these compounds exist and are members of three closely related families:

- polychlorinated dibenzo-p-dioxins (PCDDs or dioxins)
- polychlorinated dibenzofurans (PCDFs or furans)
- certain co-planar polychlorinated biphenyls (PCBs).

Dioxins are not deliberately produced, but are released into the environment as a result of combustion activities including power generation, waste incineration, metal smelting, the manufacture of some chemicals, as well as from natural sources such as bushfires and volcanoes. It is estimated that over 96 per cent of dioxins present in the environment have originated from emissions to air. PCBs were produced commercially in large quantities until the late 1970s and used in electrical appliances, such as transformers and capacitors, hydraulic fluids, plasticisers and dye carriers. Some types of PCBs are also generated and released into the environment as unintentional by-products of chemical manufacturing and combustion processes.

The NDP has focused on the 29 most toxic of these compounds which are recognised internationally as being harmful to humans and animals. These are listed in Table 1. To assist the reader, the term "dioxins" is used in this paper to refer to the three families, but there are instances where specific mention is made to furans and PCBs.

**Table 1: Dioxin, furans and PCB toxic equivalent factors (both I-TEF or NATO and $WHO_{98}$ TEF).**

| Congener | IUPAC No. | NATO CCMS or $WH0_{94}$-TEF | $WHO_{98}$-TEF [3] |

# 2. WHAT DO WE KNOW ABOUT DIOXINS IN AUSTRALIA?

Prior to establishment of the NDP, limited Australian studies showed environmental levels were low, but a lack of information made it difficult to assess dioxin impacts on the environment and human health. Starting in mid 2001, information studies were undertaken by leading Australian scientific organisations, with assistance from overseas experts, under contract to the Australian Government Department of the Environment and Heritage (DEH). Completed in 2004, these studies involved collecting samples from a range of environments across Australia, a cross section of the community, and a range of foods and agricultural commodities. Studies also looked at emissions from bushfires and motor vehicles.

As the laboratory analysis of dioxins is very expensive, the number of samples collected for each study was limited and as a result caution must be taken with interpreting the findings. Despite these limitations, the studies provide the largest survey of dioxin levels ever undertaken in Australia and will provide valuable baseline data for comparison in future work and for determining trends.

The studies show that the ambient levels of dioxins in the environment are generally low compared with other countries and that levels in the Australian population are also low. Specifically the studies showed:

- the total emissions of dioxins to the environment from all sources range from 160-1790 g per year. Uncontrolled combustion[1] (including controlled and wildfires, waste burning and accidental fires) contributes an estimated 1360 g or around 70% of all dioxin emissions. Prescribed burning and wildfires contribute between 30-570 g per year, or about 20-30% of the total emissions. As there is still uncertainty about this estimate, the Department of the Environment and Heritage (DEH) has commissioned further research to refine it.
- ferrous and non-ferrous metal production; production of chemicals and consumer goods such as paper; fossil fuel power generation; waste disposal, landfilling and waste incinerators are other main sources of emissions, emitting 420 g or around 23%.
- domestic woodheaters contribute around 4% of dioxin emissions. As dioxin levels are higher in air in urban areas during winter, these increased levels are most likely due to smoke from these heaters. However, ambient levels of dioxins in the major cities are still low compared with other countries.
- dioxins from motor vehicles account for less than 2% of total dioxin emissions. Leaded petrol vehicles accounted for about 40-45% of total dioxins emissions in 1998. With the banning of leaded petrol in January 2002 the levels will have substantially declined.
- dioxin levels in soils are generally lower than those reported in many industrial countries. Levels in soils from urban and industrial locations are substantially higher than in agricultural and remote locations. Higher levels of dioxins were found in soils from coastal eastern Australia. It has been suggested in other studies that high dioxin levels may extend along the entire eastern coastline of Australia. The comparatively elevated levels of dioxins in these

[1] The UNEP Toolkit for Identification of Dioxins and Furan Releases defines uncontrolled combustion as covering all combustion that does not occur in controlled devices such as incinerators, stoves and boilers.

soils are so far unexplained. The other studies suggest this might be due to historical geological processes. The close proximity of these areas to the coast and possible past periods of submergence by the sea led to elevated chlorine in the soil, a known precursor for dioxin formation. The evidence for dioxin formation involving natural geological processes includes:

  - a lack of identifiable human activities that could give rise to the dioxin levels
  - the dioxin profile does not relate to any current industrial activity
  - analysis of marine sediment core samples extending prior to the European occupation also showing elevated levels of dioxins
  - the occurrence of similar dioxin profiles in soil and sediment samples from other parts of the world, e.g. Mississippi River in the USA, Germany and Finland.

- aquatic environments in urban and industrial areas had higher levels of dioxins in sediments and animals than samples from agricultural and remote locations.
- dioxins emitted to air can deposit on plant, soil and water surfaces, which can then enter the food chain when animals eat leaves, soils or sediments contaminated with dioxins. Dioxins levels in Australian fauna are highest in birds of prey due to their high position in the food chain. Marine mammals living in estuaries close to urban/industrial areas also had relatively high levels. Levels were generally much lower in herbivorous animals such as kangaroos. Overall, compared with fauna from other countries, the levels are generally low.
- the ecological risk assessment concluded that the dioxin levels in fauna reflect the animal's position on the food chain with herbivorous organisms having the lowest levels, while birds of prey had the highest levels. The assessment also concluded that fish are at low risk when exposed to the dioxins levels in the Australian aquatic environment, marine mammals living in open oceans of Australia have no risk, but dolphins in urban/industrial estuaries were at risk. Terrestrial mammals are at a low risk when exposed to background levels of dioxins.
- levels in agricultural commodities, including beef, sheep, pigs, poultry, milk and farmed salmon are low compared with levels in products from other countries. They are well below standards set by the European Union.
- levels in food are low. Food samples collected under the Food Standards Australia New Zealand diet survey were analysed and showed that fish, meat and dairy products were the major food groups contributing to dioxins exposure for the general population.
- levels of dioxins in the Australian population are low by international standards. Levels are higher in older people due to a number of factors including on-going accumulation over a lifetime, the fact that older people were exposed to much higher levels in the 1940s-1960s when regulations governing the control of industrial emissions were minimal, and potential differences in metabolism and body fat.
- for Australians aged two years or older, the monthly intake of dioxins from food was between 3.9-15.8 pg TEQ/kg body weight/month or between 6-23% of the Australian Tolerable Monthly Intake of 70 pg TEQ/kg bw/month set by the National Health and Medical Research Council.

The reports of the National Dioxins Program studies can be accessed on the DEH website at: http://www.deh.gov.au/industry/chemicals/dioxins/index.html

# 3. WHY ARE DIOXIN LEVELS GENERALLY LOW IN AUSTRALIA?

The generally low levels of dioxins in the Australia environment can be attributed to a number of factors. Firstly, the levels are a reflection of the relatively low level of industrial activity in Australia compared with other countries. For example, in many northern hemisphere countries, dioxin levels are high due to a number of factors such as the extensive industrial complexes which generate dioxins and past burning of municipal waste in incinerators without adequate controls for the cleaning of exhaust gases. The large populations also contribute to higher levels through emissions from sources such as domestic heating and motor vehicles. Stricter controls on dioxin emissions from these sources and the use of improved technology have seen the levels of dioxins in many of these countries decline over the past decade.

The NDP studies found that levels of dioxins were higher in urban areas than agricultural areas in Australia. These elevated levels could be attributed to emissions over many decades from sources such as industrial facilities, motor vehicles and domestic woodheaters. Some of the highest levels in urban areas were associated with former industrial sites contaminated with dioxins due to past chemical production activities.

Secondly, actions taken by Australian governments and others over the past decade to address other toxic chemicals have most likely also led to reduced emissions of dioxins. Some of these activities include:

- the implementation of clean air regulations by States and Territories requiring industrial facilities to reduce emissions either through the use of more efficient filtering systems or cleaner production techniques
- the actions by industry in monitoring and reducing emissions of dioxins
- the banning of backyard rubbish burning
- establishing programs to replace older, polluting woodheaters with appliances that contribute to better air quality, and implementing community education programs aimed at reducing particle emissions from woodheaters
- in 2002 phasing-out the use of leaded petrol which is a known source of dioxins
- Australian environment ministers rejecting a proposal in 1992 for a centralised high temperature waste disposal facility for the treatment of intractable wastes and instead promoting the separate treatment of each waste stream through programs such as the National Strategy for the Management of Scheduled Wastes[2]. Under this Strategy, three management plans were developed to phase-out and destroy organochlorine pesticides (OCPs), hxachlorobenzene (HCB) and polychlorinated biphenyls (PCBs)
- banning the manufacture and use of chemicals known to be sources of dioxins including pentachlorophenol and 2,4,5-T
- destroying OCPs and PCBs in destruction facilities which operate in accordance with world's best practice

[2] The Strategy was endorsed by environment ministers in 1993 and provides for the safe management and disposal of scheduled wastes. The Strategy provides for the development and implementation of the three national plans dealing with organochlorine pesticides, hexachlorobenzene and polychlorinated biphenyls.

- remediating old industrial sites contaminated with toxic chemicals, including dioxins, such as the 2000 Olympics site at Homebush Bay, Sydney

# 4. WHAT ARE THE OBLIGATIONS UNDER THE STOCKHOLM CONVENTION?

In the 1990s, countries recognised the need to take international action aimed at reducing persistent organic pollutants (POPs) to protect the environment and human health. This led to the formation of the Stockholm Convention on Persistent Organic Pollutants which entered into force on 17 May 2004. As at 2 May 2005, 151 countries had signed and 98 had ratified the Convention. Australia ratified the Convention on 20 May 2004.

The objective of the Stockholm Convention is to protect human health and the environment from the effects of POPs. The Convention sets out a range of measures to reduce and, where feasible, eliminate POP releases, including emissions of by-product POPs and to ensure the sound management of stockpiles and wastes that contain POPs.

The Convention focuses on the following twelve POPs which have been used as pesticides, industrial chemicals, or are by-products from industrial processes. These chemicals have been identified for action due to their persistence, bioaccumulation, long-range dispersion and toxicity:

| **Chemical** | **Pesticide** | **Industrial** | **Unintentionally produced** |
|---|---|---|---|
| Aldrin | ✓ | | |
| Chlordane | ✓ | | |
| Dieldrin | ✓ | | |
| Endrin | ✓ | | |
| Heptachlor | ✓ | | |
| Hexachlorobenzene (HCB) | ✓ | ✓ | ✓ |
| Mirex | ✓ | | |
| Toxaphene | ✓ | | |
| Polychlorinated biphenyls (PCBs) | | ✓ | ✓ |
| DDT | ✓ | | |
| Dioxins (polychlorinated dibenzo-p-dioxins) | | | ✓ |
| Furans (polychlorinated dibenzofurans) | | | ✓ |

Under Article 5 of the Convention, Parties are obliged to take measures to reduce, and where feasible, eliminate releases of unintentionally produced POPs, including dioxins, furans, HCB and dioxin-like PCBs. Parties must set out how they would implement these obligations in a National Action Plan (NAP). The actions proposed in this paper would form the basis of Australia's NAP.

Article 5 also requires Parties to promote the development of and (where appropriate) require the use of products or processes to prevent the formation and release of unintentionally produced POPs; and promote and, in accordance with its NAP, require the use of Best Available Techniques (BAT) and Best Environmental Practices (BEP) for new sources, and where existing sources are substantially modified. The Convention defines "Best Available Techniques" as using the most effective and advanced techniques that can be practically adopted to *prevent or minimise* harmful emissions of by-product POPs and other environmental impacts, or *reduce* them to acceptable limits.

"Available" techniques means those techniques that are accessible to the operator and that are developed on a scale that allows implementation in the relevant industrial sector, under economically and technically viable conditions, taking into consideration the costs and advantages.

"Best environmental practices" means the application of the most appropriate combination of environmental control measures and strategies.

The Convention requires Parties to use BAT for **new sources** in the following categories as soon as practicable but no later than four years after the entry into force of the Convention for that Party; this would be May 2008 for Australia:

- waste incinerators, including co-incinerators of municipal, hazardous or medical waste or of sewage sludge
- cement kilns firing hazardous waste
- production of pulp using elemental chlorine or chemicals generating elemental chlorine for bleaching
- thermal processes in the metallurgical industry including secondary copper, aluminium and zinc production and sinter plants in the iron and steel industry.

Parties are also required to promote in accordance with the implementation schedule of its action plan, the use of BAT and BEP to prevent the release of dioxins for **existing sources** for the above industries as well as other categories including:

- open burning of waste, including burning of landfill sites
- thermal processes in the metallurgical industry not mentioned above
- residential combustion sources
- fossil fuel fired utility and industrial boilers
- firing installation for wood and other biomass fuels
- specific chemical production processes releasing unintentionally formed persistent organic pollutants, especially production of chlorophenols and chloranil
- crematoria
- motor vehicles, particularly those burning leaded gasoline
- destruction of animal carcasses
- textile and leather dyeing (with chloranil) and finishing (with alkaline extraction)
- shredder plants for the treatment of end of life vehicles
- smouldering of copper cables
- waste oil refineries.

An international Expert Group comprising representatives from Parties, including Australia, has developed draft guidelines on BAT and provisional guidance on BEP. These Guidelines are not prescriptive but will assist Parties in ensuring that facilities, which are known sources of dioxins, are operating in line with world's best practice. The first meeting of Conference of the Parties of the Stockholm Convention (May 2005) recommended that Parties take the draft guidelines and provisional guidance into consideration, where practicable and feasible, in activities related to unintentionally produced persistent organic pollutants. The Expert Group will undertake further work over the next two years to improve the information contained in the BAT and BEP guidelines with a

view their consideration and adoption at the third Conference of the Parties in 2007. Consideration needs to be given to determine how these guidelines will be implemented in a consistent manner in Australia and how they might be reflected in regulatory requirements in jurisdictions.

Article 6 of the Convention requires Parties to develop appropriate measures to eliminate releases of POPs from stockpiles and wastes by:

- developing appropriate strategies for identifying stockpiles, products and articles containing, consisting of or contaminated with POPs
- implementing measures to reduce or eliminate releases from stockpiles and wastes containing POPs in a manner that protects human health and the environment
- taking appropriate measures to ensure that waste products containing dioxins are handled in an environmentally friendly manner and are disposed of in a way that destroys the POPs content
- endeavouring to develop strategies for identifying sites contaminated with POPs; if remediation is required then it must be done in an environmentally sound manner.

The three management plans developed under the National Strategy for the Management of Scheduled Wastes will contribute to meeting these obligations.

# 5. WAYS TO ADDRESS DIOXINS IN AUSTRALIA

A review of existing national, State and Territory environmental programs and legislation shows that there are a number of measures which apply controls, standards or guidelines for chemicals. Some already cover dioxins whereas others could be modified to include, for example, a guideline level for the emissions of dioxins. Some measures are subject to review over the next one to two years and will need to consider dioxins in these reviews.

This section outlines the existing measures, identifies gaps and suggests actions to address dioxins in Australia.

Table 2 summarises dioxin emissions estimates from the top 25 emitters categories as determined in the National Dioxins Program "Inventory of Dioxin Emissions in Australia, 2004".

**Table 2: Emission estimates by subcategory - top 25 emitters**

| Source Category | Annual Estimated Release (g TEQ/annum) | | | |
|---|---|---|---|---|
| | **Air** | **Water** | **Land** | **Total** [a] |
| Biomass burning (includes prescribed burning | 240 | 0 | 1,020 | 1,270 |
| Pulp and paper production | 0.4 | 0.2 | 103 | 104 |
| Waste burning and accidental fires | 88 | 0 | 8.7 | 97 |
| Zinc production | 50 | 0 | 0 | 50 |

| **Total** | **500** | **3.2** | **1,271** | **1,778** |

## 5.1 AIR

The inventory of dioxin emissions in Australia (NDP Technical Report No 3) shows that the main sources of dioxins to the environment are from uncontrolled combustion (includes prescribed burning and wildfires, waste burning and accidental fires) which is estimated to contribute nearly 70% of total emissions. The next highest emitters of dioxins to air are metal smelting (including zinc, aluminium, iron and steel) and fossil fuel power generation. Domestic woodheaters contribute around 4%.

### Emissions from combustion facilities

The level of 0.1 ng TEQ/$m^3$ of dioxins has been accepted internationally as a goal for achieving best practice for controlling emissions of dioxins from combustion sources.

In Australia this level has been adopted by most States and Territories with some jurisdictions prescribing this level in legislation while others adopting it as a licence condition (Table 3). The responsibility for licensing facilities rests with the States and Territories and not the Australian Government.

**Table 3: Jurisdictional regulations for dioxin emissions to air**

| | ACT | NSW | QLD | SA | TAS | VIC | WA |
|---|---|---|---|---|---|---|---|
| **Level** | 0.1 ng/$m^3$ | 0.1 ng/$m^3$ (stack) | 0.1 ng/$m^3$ | 0.1 ng/$m^3$ | 0.1 ng/$m^3$ * (stack) | 0.1 ng/$m^3$ * | 0.1 ng/$m^3$ |
| **How** | Lic | Leg | Lic | Lic | Lic | Lic | Lic |
| **Apply** | | New facilities and upgrades. | New facilities and upgrades | | New and upgrade of old facilities. Permit conditions to reflect best practice. | New facilities | |

**Legend:**

Leg: Prescribed through legislation

Lic: Prescribed through licensing agreements

* The new figure of 0.0037 ng/$m^3$ at ground level has come into effect on 1 June 2005 under the *Environment Protection Policy (Air Quality) 2004*

As discussed under Section 4, Parties under the Stockholm Convention are required from four years after entry into force for them to promote BAT and BEP for new facilities and existing facilities which are to be modified. Although these Guidelines will not be mandatory for Parties, they must be taken into consideration and will provide a valuable benchmark against which Australian governments can ensure that facilities that are known sources of dioxins are meeting world's best practice.

***Actions for Governments:***

***Adopt or reaffirm 0.1 ng TEQ/$m^3$ as a guideline emission level for new combustion facilities and for existing combustion facilities when they are upgraded.***

***Use recommendations in the Stockholm Convention BAT and BEP guidance for new facilities and for existing facilities when they are upgraded.***

## Emissions from domestic woodheaters

The ambient air study (NDP Technical Report No 4) has shown that levels of dioxins in ambient air are low compared with other countries. There was an increase in urban areas over winter most likely due to wood burning for residential heating. Domestic woodheaters account for around 4% of total dioxin emissions.

DEH, along with State and Territory governments, has implemented a range of measures to reduce woodsmoke from domestic heaters in recent years. These measures include woodheater replacement programs, education and awareness programs, development of regulations to minimise excessive smoke from woodheaters, and the development of more stringent particle emission standards. Although the principal objective of these initiatives is to reduce particle emissions from woodheaters, it is expected that the levels of dioxins over the winter months would also be reduced as a result of these initiatives.

***Actions for Governments:***

***Continue with existing measures aimed at reducing particle emissions from domestic woodheaters including community education on the correct operating practices for woodheaters, seeking improvements to woodheater installation and emission standards, and sponsoring research to improve our understanding of woodheater emissions.***

## Emissions from motor vehicles

The study of dioxin emissions from motor vehicles (NDP Technical Report No 2) has shown that motor vehicles contribute less than 2% of total dioxin emissions, with leaded petrol and diesel fuel vehicles the highest contributors. However, in January 2002 the Commonwealth Government phased out the use of leaded petrol in Australia.

With the phase-out of leaded fuel, it is expected that the total dioxin emissions from motor vehicles will have substantially declined in recent years.

There is little information on the emissions of dioxins from diesel vehicles, but what research has been undertaken indicates that diesel vehicles may contribute a large proportion of the total dioxin emissions from motor vehicles. The reason for the formation of dioxins in diesel engines is still unclear.

In the absence of any dioxin emissions data, vehicles using Liquefied Petroleum Gas (LPG) and Compressed Natural Gas (CNG) are assumed to have emission factors similar to passenger cars running on unleaded petrol. However, the motor vehicle study noted that the overall impact of these vehicle types on total dioxin emissions is low due to LPG and CNG vehicles accounting for only a small part of total vehicle kilometres travelled.

***Action for the Australian Government:***

***Monitor overseas research looking at emissions of dioxins from diesel, LPG and CNG vehicles to determine whether further action is required in Australia.***

## Emissions from bushfires

The bushfires study (NDP Technical Report No 1) shows that prescribed burning and wildfires may account for around 20-30% of total dioxin emissions to the environment. Savannah fires in northern Australia account for 83% of these emissions.

Restrictions cannot be placed on wildfires, but they are placed on hazard reduction control burns to minimise impact on human health from smoke and not to destroy too much native vegetation. As the conditions for the formation of dioxins in bushfires are very complex and are still not fully understood, it would be very difficult to place conditions on permits aimed solely at reducing dioxin emissions.

DEH will fund further research on the formation and emission of dioxins from bushfires. This research will aim to provide a more accurate estimation of the total emissions of dioxins from bushfires in Australia and to determine the extent to which dioxin releases are the result of new dioxin formation during a fire, or re-mobilisation of existing dioxin stored in the top soil, ground litter and vegetation. The CSIRO, in conjunction with the National Research Centre for Environment Toxicology will undertake this research in 2005.

***Action for the Australian Government:***

***Undertake further research on dioxin emissions from bushfires to provide firmer evidence on the formation of dioxins to help governments determine appropriate response measures, if any.***

## Air toxics NEPM

In February 2001, the National Environment Protection Council (NEPC) established a Working Group to scope the development of a National Environment Protection Measure (NEPM) for Air Toxics, sometimes known as hazardous air pollutants. In June 2001, the Working Group recommended that five priority air toxics be the subject of a NEPM, from a list of 29 air toxics including dioxins. Dioxins were not identified as a priority at that time as there were insufficient data on their levels in Australia.

In June 2001, NEPC commenced the development of a NEPM for Air Toxics to address benzene, toluene, formaldehyde, xylenes and polycyclic aromatic hydrocarbons (PAHs). The draft Air Toxics NEPM and Impact Statement were released for public consultation in May 2003. At the 9$^{th}$ meeting of EPHC in December 2004, Council resolved to make the National Environment Protection (Air Toxics) Measure.

While results from the NDP show that the risk presented by dioxins in ambient air in Australia is very low, dioxins, along with other air pollutants, will be considered for possible future inclusion in the Air Toxics NEPM. A Working Group has been established under the EPHC to develop a process to prioritise air toxics.

***Action for Governments:***

***The EPHC Air Toxics Working Group to utilise NDP Ambient Air study data when assessing the relative priority of dioxins, for possible inclusion in the Air Toxics NEPM.***

## 5.2 SOILS

The soil study (NDP Technical Report No 5) shows that dioxin levels in remote and agricultural areas are generally lower compared with soils in urban and industrial areas. Overall, the study found that levels in soils are generally low compared to levels in many other countries. The comparatively elevated levels of dioxins in coastal soils in Queensland are so far unexplained. Scientists have suggested that the higher levels of dioxins in coastal eastern Australian soils may be due to historical geological processes. Further research would be needed in order to confirm this view or to determine another sources, if considered warranted.

The area of land with this high level of naturally occurring dioxin is very large. Given the dioxin levels found, it appears that remediation is neither warranted nor indeed feasible.

There are currently no national agreed acceptable level or guidelines in place for dioxins in soils in Australia. However, the *National Environment Protection (Assessment of Site Contamination) Measure 1999* specifies an effective process that covers chemicals that do not have a nationally agreed health investigation level.

### Site Contamination NEPM

The purpose of the *National Environment Protection (Assessment of Site Contamination) Measure 1999* (Site Contamination NEPM) is to establish a nationally consistent approach to the assessment of site contamination to ensure sound environmental management practices by regulators, site assessors, environmental auditors, land owners, developers and industry. The desired environmental outcome for the Site Contamination NEPM is to provide adequate protection to human health and the environment, where site contamination has occurred, through the development of an efficient and effective national approach to the assessment of site contamination. The Site Contamination NEPM provides general guidance in relation to ecological, groundwater and health-based investigation levels.

The Site Contamination NEPM sets health-based investigation levels for a range of chemicals including heavy metals, pesticides and PCBs. Currently, there is no health-based investigation level set for dioxins. At its 9$^{th}$ meeting in December 2004, EPHC agreed to undertake a review of the Site Contamination NEPM. It was resolved to establish a committee to assist with this review which would develop and release an issues paper. The review will consider the need to establish investigation levels for additional chemicals including dioxins.

Some States and Territories have sites contaminated with dioxins, and some of these have been remediated, including some orphan sites. Clean-up of a contaminated site is usually required if the levels of contamination pose an unacceptable risk to human health or the environment. Where contaminants are moving off the site, State and Territory governments will continue to require, encourage or undertake the clean-up of such sites as they come to their attention and as contaminated site policy dictates.

***Action for Governments:***

***In the review of the Site Contamination NEPM during 2005/2006, consider including health-based investigation levels for dioxins. Investigation level for sites contaminated with dioxins may provide guidance which will lead to uniformity of site risk assessment. Consider the feasibility of a screening process for identifying sites where dioxins could be present.***

***Continue best efforts towards remediating sites where dioxin contamination poses an unacceptable risk to the environment or human health and undertake this work in an environmentally sound manner.***

***Action for the Australian Government***

***Consider further research to improve our knowledge of natural dioxins formation, and the sources and exposure risks to sources of dioxins in the soils of coastal eastern Australia.***

## 5.3 WATER

Dioxins are insoluble in water, therefore the most effective way of determining levels in aquatic environments is to analyse sediments and aquatic animals. This is discussed in section 5.4.

As part of Australia's National Water Quality Management Strategy, the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000 Volume 1* (the *Water Quality Guidelines*) provides a guide for setting water quality objectives required to sustain current, or likely future, environmental values (beneficial uses) for natural and semi-natural water resources in Australia and New Zealand.

These and other National Water Quality Management Strategy guidelines help communities and water authorities achieve consistency for the level of service provided by local water and sewage systems.

The *Water Quality Guidelines* mention dioxins (2,3,7,8-tetrachlorodibenzo-*p*-dioxin) in marine ecosystems, but as there was insufficient data available on dioxins when the guidelines were being developed, no level is given for dioxins in any water ecosystem.

It is expected that these guidelines will be updated in the next few years. Inclusion of a level for dioxins in water could be considered, although as dioxins are insoluble in water, the setting of a level may be problematic given the difficulty in measuring their presence.

***Action for Governments:***

***Consider including a level for dioxins in water when undertaking a future update of the Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000.***

## 5.4 SEDIMENTS

The results of the aquatic environment study (NDP Technical Report No 6) show that the levels of dioxins in most aquatic environments in Australia are generally low when compared to levels from many other industrialised countries. However, sediments in urban and industrial areas had significantly higher levels of dioxins than sediments in remote and agricultural locations. Some estuaries, for example, Port Jackson, Sydney had very high levels in sediments similar to those found in estuaries adjacent to industrial centres in other countries. These elevated levels may be due to

historical contamination from former chemical manufacturing sites near Homebush Bay. These sites are subject to current clean-up activities by the NSW Government.

The *Water Quality Guidelines* applies to sediment quality, but there are no levels for dioxins. These guidelines are expected to be updated in future, with sediment levels a component of the update. Inclusion of a level for dioxins could be considered.

***Action for Governments:***

***Consider including a level for dioxins in sediments when undertaking a future update of the Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000.***

## 5.5 BIOTA

Dioxins emitted to air can deposit on plant, soil and water surfaces. Dioxins can then enter the food chain when animals eat contaminated leaves, soils or sediments. The dioxins are then absorbed into animal fat. Dioxins increase in concentration as they move up the food chain, so that carnivores are more likely to have higher levels than herbivores.

The fauna study (NDP Technical Report No 7) found that levels are generally lower in Australia compared with fauna in other countries. Birds of prey had the highest levels, due to their position at the top of the food chain. Levels were much lower in herbivorous animals such as kangaroos, galahs and dugongs.

There are currently no regulated levels for dioxins in biota in Australia. The ecological risk assessment (NDP Technical Report No 11) noted that more reliable risk estimations would require information on the toxicity of dioxins to Australian wildlife species. However, as Australian ethical committees and current State legislation generally do not allow toxicity testing on native species, the establishment of a level for dioxins in biota would be very difficult. Reduction of emissions in Australia will most likely lead over time to lower levels of dioxins in Australian biota.

***Action for Governments:***

***Subject to resources, the Australian Government to give consideration to undertaking further studies of biota in order to assess whether source directed measures are having the desired effect in lowering dioxin levels in biota.***

## 5.6 WASTES

### Sewage effluent and biosolids

The risk to environmental and human health from dioxins in sewage effluent and biosolids is low. The inventory of dioxin emissions (NDP Technical Report No.3) shows that sewage treatment works emit small amounts of dioxins to land. Emissions from biomass burning and paper production represent the most significant contributors to land.

The potential for dioxins to enter sewerage systems is low, primarily due to the limited number of industrial sources that produce dioxins and discharge to sewer. In addition, trade waste policies employed by sewage management authorities may limit or exclude dioxins from entering the sewerage system. Increasing use of recycled sewage and biosolids has the potential to shift some of the load of dioxin presently discharged to waterways to land.

Dioxins in recycled water are currently being considered by the Environmental Contaminant Working Group for the *National Guidelines for Water Recycling - Managing Health and Environmental Risk* being prepared under the National Water Quality Management Strategy (NWQMS). These Guidelines are being developed in consultation with the States and Territories and are due for completion in 2005. They will cover water recycling and water sensitive urban design using a risk management framework already tested on the Australian Drinking Water Guidelines. These Guidelines will supersede current guidelines for reclaimed water and urban stormwater management.

The NWQMS *Guidelines for Sewerage Systems Biosolids Management* were agreed to at the Natural Resource Management Ministerial Council in December 2004. These guidelines are due for public release in mid 2005. A level for dioxins was not included in these guidelines. However, as the knowledge of dioxin levels in biosolids is limited, further work and research is presently being undertaken in this area to confirm what the quantities are and the risks they pose.

***Action for Governments:***

***Where information identifies environmental or human health risks from dioxins in water recycling and biosolids activities, consider including a level for dioxins when undertaking a future update of the National Water Quality Management Strategy:***

***- Guidelines for Water Recycling – Managing Health and Environmental Risks; and***

***- Guidelines for Sewerage Systems – Biosolids Management.***

## Trade Waste

Through the NWQMS *Guidelines for Sewerage Systems: Acceptance of Trade Waste (Industrial Waste) 1994,* (*Trade Waste Guidelines*), trade waste, a liquid waste generated from any industry, business, trade or manufacturing process, must be managed to minimise the cost to the community of processing waste, to ensure environmental protection and encourage waste minimisation.

There are currently no levels set for dioxins. However, the guidelines may be amended where the local sewage authority has an appropriate scientific basis to nominate alternative criteria.

***Action for Governments:***

***Consider including a level for dioxins when undertaking a review of the NWQMS Guidelines for Sewerage Systems: Acceptance of Trade Waste (Industrial Waste) 1994.***

## National Strategy for the Management of Scheduled Wastes

In 1991, the former Australia and New Zealand Environment Conservation Council (ANZECC) considered a draft strategy based on the recommendations of a joint taskforce to tackle the problem of scheduled wastes. The Strategy was released to address concerns by industry and environment groups on the disposal of this waste. An independent panel was established to investigate the extent and production of scheduled waste and alternative disposal technologies to be used. Based on this recommendation, ANZECC rejected the proposal to establish a centralised high temperature waste disposal facility and instead, establish criteria and arrangements to assess new technologies. The

revised Strategy was considered by government and non-governmental agencies and in 1992 ANZECC endorsed the '*National Strategy for the Management of Scheduled Wastes'*.

The Strategy focuses on emerging, alternative, non-incineration waste destruction technologies with the aim to provide for the safe management and disposal of scheduled waste. For the purpose of the Strategy, scheduled wastes means a material or article containing a chemical, or mixture of chemicals exceeding the threshold concentration and threshold quantity, which is:

- organic in nature
- resistant to degradation by chemical, physical or biological means
- toxic to humans, animals, vegetation or aquatic life
- bioaccumulative in humans, flora and fauna.

The key aspects of the Strategy are:

- identification of separate waste streams facilitating distinct and diverse management and disposal options
- nationally agreed and consistent principles and practice
- regulatory support through legislation and regulations
- commercially viable management disposal/destruction strategies for wasteholders
- based on a consultative and open process.

The main development under the Strategy, was the establishment of three management plans which specify threshold concentrations, quantities of chemicals to be covered and phase-out dates for the three groups of chemical wastes:

- *Organochlorine Pesticides Waste Management Plan 1999*
- *Polychlorinated Biphenyls Management Plan 1996* (revised 1999)
- *Hexachlorobenzene Waste Management Plan 1996*

The three plans all require that emissions of dioxins to atmosphere from the destruction of scheduled wastes shall not exceed 0.1 ng TEQ/$m^3$.

While there has been good progress in removing organochlorine pesticides and polychlorinated biphenyls from use and destroying them, the process for the treatment of the hexachlorobenzene (HCB) waste held at the Orica site in Botany is under review. In determining the treatment process for the HCB waste, consideration should be given to the Stockholm Convention guidance on Best Available Techniques and Best Environmental Practices to prevent or minimise the formation and release of dioxins.

***Action for Governments:***

***Continue the removal from use and destruction of scheduled wastes in accordance with the three plans under the National Strategy for the Management of Scheduled Waste.***

***Ensure that the Stockholm Convention guidance on Best Available Techniques and Best Environmental Practices is considered in selecting the process to treat the HCB waste so as to prevent or minimise the formation and release of dioxins.***

## Pulp mill guidelines

Commonwealth Ministers in May 1989 commissioned the CSIRO to undertake a study of bleached chemical pulp mill technology and environmental implications. On the basis of the conclusions from this study, the first set of guidelines, *Environmental Guidelines for New Bleached Eucalypt Kraft Pulp Mills* (*Pulp Mill Guidelines*) for the pulp mill industry were developed and subsequently revised in 1995 to include current State/Territory policies and incorporate new technical information. The objective of these Guidelines is to ensure protection of the environment from emissions generated by future pulp mills.

The guidelines set emission limits to ensure that the best technology and best environmental management practices are used in any new mill. The limits for dioxins in the effluent stream to be discharged to water are set at 15 pg/L.

In 2004 the Tasmanian Government reviewed these guidelines to take into consideration current world's best practice for any future bleached eucalypt kraft mills. They are consistent with the BAT and BEP guidance for production of pulp developed under the Stockholm Convention. The review, undertaken by the Tasmanian Resource Planning and Development Commission, has set new restrictions on a mill's environmental impact which all but eliminates dioxins and cuts organochlorine emissions and organic matter discharged in waste water.

With the discharge to effluent, the Commission has recommended that dioxins be set at a maximum limit of 10 pg/L, a reduction from the previous level of 15 pg/L.

The Stockholm Convention BAT and BEP guidance will be revised in future to include new technologies or practices.

***Action for Governments:***

***Take into account the Stockholm Convention BAT and BEP guidelines for production of pulp when new mills or modifications to existing mills are proposed.***

## Reuse of industrial residues for land management applications

In October 2002 the EPHC agreed to develop a national approach for the re-use and recycling of industrial residues. The Ministers directed the EPHC Standing Committee to develop a national framework for the reuse and recycling of industrial residues focusing initially on their use in land management applications. It is envisaged that the framework would provide guidance on management approaches for industrial residues from source to end-use, and its ultimate fate in the environment.

Industrial residues are by-products (wastes) from industry which can be reused and recycled as an efficient means of enabling industry to contribute to sustainable resource management. Industrial residues have the potential to exhibit valuable soil conditioning and fertiliser properties due to their high levels of essential elements, such as zinc and magnesium, which are deficient in some Australian soils. However, there are a number of elements, such as cadmium, that can have adverse affects on the environment and human health, if present in high concentrations.

The EPHC Industrial Residues Working Group is currently working with the Fertiliser Working Group, a Primary Industries Standing Committee body, in developing national standards for contaminants in fertiliser. A standard for dioxins will be included.

***Action for Governments:***

***Consider setting a level for dioxins in fertilisers and industrial residues when applied to land for soil amelioration purposes.***

**Used Oil Regulations**

The *Product Stewardship for Oil Program* was introduced in 2001 by the Australian Government to provide incentives to increase used oil recycling with the aim to encourage the environmentally sustainable management and re-refining of used oil.

The *Product Stewardship (Oil) Act 2000* establishes the general framework and benefit entitlements of the arrangements. The objectives of the Act are to:

- develop a product stewardship arrangement for used oils
- ensure the environmentally sustainable management, re-refining and reuse of used oil
- support economic recycling options for used oil.

Under the *Product Stewardship (Oil) Amended Regulations 2003 (No. 1),* the total amount of dioxins and furans in re-refined base oil (Category 1) must be less than 10 pg/g of oil. This level was based on methods developed by the United States of America Environment Protection Agency.

A review of the Act in July 2004 was tabled in the House of Representatives in November 2004. The recommendations are now currently out for public consultation. There were no recommendations to amend the level of dioxins and furans in re-refined base oil.

***Action for the Australian Government:***

***No further action required at this time to amend the level of dioxins and furans in re-refined base oil.***

## 5.7 NATIONAL POLLUTANT INVENTORY

The *National Pollutant Inventory (NPI) National Environmental Protection Measure* is an Internet database designed to provide the community, industry and government with information on the types and amounts of certain substances being emitted to the environment.

The NPI contains data on 90 priority substances, including polychlorinated dioxins and furans, which were identified as important because of their possible health and environmental effects. The NPI requires reporting from a wide range of industry and non-industry sources using a variety of techniques. Facilities must report on dioxins and furans if they exceed the reporting threshold i.e. if a facility uses 2,000 tonnes or more of fuel, or 60,000 megawatt hours of energy per year.

Currently, the NPI reports the emissions of polychlorinated dioxins and furans in kilograms per year. However, polychlorinated dioxins and furans are complex mixtures and are usually reported by other programs and studies in toxic equivalents (TEQ). TEQ is a means of scaling the emissions of each type of dioxins and furans according to their relative toxicity.

The reporting of polychlorinated dioxins and furans in TEQs would bring the NPI into line with current world's best practice. It would also provide a more useful data set, simplify reporting by industry and enable easier benchmarking within Australia and between other countries.

At the 9th meeting of EPHC in December 2004, Council resolved to review the NPI NEPM. The NPI NEPM has been operational for six years and as the program is used by a variety of groups, the review was to establish whether the program is currently delivering all the benefits expected of the program.

The review targeted the areas for improvements and built on earlier reviews, evaluating whether previous recommendations were still relevant. The review set out to identify possible changes to design parameters for the NPI. The outcome of the review will provide a starting point for Council to consider whether to embark on a process to vary the NPI NEPM.

The review has been carried out by an independent reviewer under the supervision of an EPH Standing Committee working group and the results have been submitted to EPHC.

***Action for Governments:***

***Consider reporting dioxins in toxic equivalents (TEQs) under the National Pollutant Inventory.***

## 5.8 HUMAN INTAKE

The human health risk assessment (NDP Technical Report No 12) found that the public health risk for Australians from the exposure of dioxins from food and other sources is low. However to keep this level low, the report made a number of recommendations with the aim of reducing any potential risks to human health:

- programs to reduce the release of dioxins into the environment need to be ongoing
- ways to block the cycling of dioxins through the food supply need to be identified
- reducing the levels of dioxins in feed given to livestock, poultry and aquaculture fish will help to reduce the levels of dioxins in the food supply
- since foods high in animal fats are a source of exposure to these chemicals, current efforts to promote lower saturated fat intake in the population should continue
- due to the inhalation of dioxins through cigarette smoke, current programs to discourage cigarette smoking should be maintained
- the population burden of dioxin-like compounds should be monitored periodically, to see whether risk reduction strategies are effective.

Action relating to reducing the environmental release of dioxins is considered under sections 5.1 to 5.7 and section 5.11. Action relating to stockfeed is considered under section 5.9.

As the levels of dioxins in breast milk are low by international standards and have declined over the last decade (as outlined in NDP Technical Report No 10) it should be noted that it is the advice of the World Health Organisation and the National Health and Medical Research Council (NHMRC) in Australia that breast milk is the best food for babies.

Efforts to promote lower saturated fat intake in the population are reflected in several recent Australian Government initiatives. The *NHMRC's 2003 Dietary Guidelines for Australian Adults* and the *Dietary Guidelines for Children and Adolescents in Australia* both recommend 'limiting saturated fat' in the diet and provide practical advice on how this can be achieved. This recommendation is supported by the Australian Government's national food selection guide, the *Australian Guide to Healthy Eating* (1998), an educational resource providing advice on eating for good health. Organisations such as Nutrition Australia, the Dieticians Association of Australia and the National

Heart Foundation of Australia also support reducing saturated fat intake through provision of professional and consumer-based advice, resources and projects. Other national initiatives, including a focus on healthy eating, although not specifically aimed at reducing saturated fat intake, include: the National strategic framework and agenda for action for public health nutrition, (*Eat Well Australia*, 2000-2010) developed by the Strategic Inter-Governmental Nutrition Alliance and the Australian Government's response to the issue of overweight and obesity in children - *Healthy Weight 2008: the national action agenda for children and young people and their families* (2003).

Tobacco leaf naturally contains both organic carbon and chlorine ions and consequently, as for any thermal process, "combustion" of cigarettes and cigars produces dioxins. On studies undertaken in Germany and Sweden, emissions on average from the smoking of a cigarette were 0.1pg TEQ/cigarette. Recent studies in Australia illustrate that on average the smoking population smoke 14 to 15 cigarettes per day. For those who smoke approximately 20 cigarettes a day, this could result in a dioxin intake of 3 pg/day. For smokers, the health risk from other carcinogenic components of cigarettes far outweigh the likely health risk from dioxins, however, it appears that encouraging people to give up smoking would help reduce their body burden of dioxins.

Australia has a comprehensive tobacco policy expressed in the *National Tobacco Strategy 2004-2009*. The Australian Government discourages cigarette smoking through the national prohibition of tobacco advertising and sponsorship; health warnings on tobacco packaging; the classification and scheduling of smoking cessation pharmacotherapies; customs duty and excise on tobacco products; control of illicit production and distribution; and prohibition of smoking in certain venues such as airports. The Government has introduced regulations to require new, graphic health warnings on cigarette packaging from March 2006. States and Territories are responsible for smoking cessation support services (Quitlines); regulation of retailers, including registration and licensing where applicable; prevention, detection and prosecution of sales to minors; smoking restrictions in non-Australian Government venues (the vast majority); and local restrictions on advertising and sponsorship, including point of sale advertising. Both tiers of government are involved in public information campaigns. These efforts have given Australia one of the lowest smoking rates in the world (17.4% of the population aged 14 and over were smokers in 2004).

***Action for Governments:***

***Continue with existing programs that discourage cigarette smoking and promote lower saturated fat intake.***

***Continue to promote the health benefits of exclusive breastfeeding to the age of six months, then the introduction of complementary foods and continued breastfeeding thereafter.***

***Subject to resources, give consideration to periodically monitoring the population burden of dioxins in order to assess whether risk reduction strategies are having the desired effect in lowering dioxin levels in humans.***

## 5.9 AGRICULTURAL PRODUCTS

### Agricultural commodities

The Australian National Residue Survey (NRS) is a program conducted by the Department of Agriculture, Fisheries and Forestry (DAFF). The NRS was established in the early 1960s as the Commonwealth's response to growing concerns about pesticide residues in major meat export markets. The purpose of the NRS now is to monitor and report the level of residues and contaminants in food, inputs to production and/or the environment. Since then, the range of commodities covered by the NRS has expanded and now, about 15 animal, 14 plant and selected fisheries and aquaculture products are monitored. The NRS is not involved in the testing of imported food or animal feedstuffs.

Residue[3] testing is an important part of the national strategy to minimise unwanted residues and environmental contamination in food. Monitoring identifies potential problems and any necessary follow-up action. Residue testing is also an important measure of product quality, particularly for exporting countries such as Australia. The NRS also monitors and reports the level of residues and contaminants in food and inputs to production and/or the environment.

The NRS conducts or is involved in monitoring surveys and surveillance, compliance and residue prevention programs. Residue prevention programs are designed to prevent or minimise the risks of unacceptable residues to public health and trade. Chemical commodity combinations to be included in surveys are determined by the NRS in consultation with industries on the basis of risk assessments, and those combinations of highest risk are including in the NRS monitoring surveys. In conducting risk assessments, the main factors considered include international and/or domestic perceptions of the chemical commodity combination as a possible public health hazard or trade barrier, the toxicity of the chemical or its break-down products and the extent and results of previous monitoring of the chemical commodity combination.

Concentrations of residues of agricultural and veterinary chemicals and environmental contaminants, such as metals, are assessed against Australian standards that are expressed as Maximum Residue Limits (MRL), which are maximum permissible limits for chemical residues in food. MRL's are set by Food Standards Australia New Zealand (FSANZ) and the Australian Pesticides and Veterinary Medicines Authority (APVMA). MRLs have been set for PCBs in food such as meats, however there are no current limits set for dioxins and furans.

Contaminants that have been surveyed include organochlorines, organophosphates, PCBs, and antimicrobials. Dioxins were surveyed in 2002-03 for the first time under the NDP and the results were reported in the NDP Technical Report No 8[4]. The NDP study shows that levels of dioxins and dioxin-like PCBs in Australia's meat, milk and fish are low and compare favourably with levels reported in comparable studies from other countries. No samples contained dioxin levels exceeding the European Union standard. In view of the results of this survey, and given the significant costs associated with dioxins testing, DAFF does not support routine on-going testing of livestock commodities but would consider further testing in ten years, subject to resources.

---

[3] Residues in agricultural terms are generally used to describe a small amount of a chemical treatment or its breakdown products which remain in or on a product. Residues in food safety include elements, such as metals, or other chemicals which may be present in food either through natural circumstances or as a consequence of industrial or agricultural activities.

[4] The work in this study was co-funded by participant industry groups.

***Action for the Australian Government:***

***Subject to resources, give consideration to undertaking a study in ten years in order to ensure dioxin levels in livestock commodities remain within international and domestic standards.***

**Stockfeeds**

Regulatory controls over imports of animal feeds are primarily the responsibility of the Australian Government. No specific legislation currently exists to address potential food hazards in imported animal feeds unless they can be shown to be a quarantine risk and dealt with under the *Quarantine Act 1908*. There are currently controls in every Australian jurisdiction to prevent the use of restricted animal material in feeds for ruminants. Other feed controls are managed under the "Uniform Australian Standards for the Labelling and Content of Stock Foods", which was agreed to by the then Standing Committee on Agriculture and Resource Management (now Primary Industries Standing Committee, PISC) in February 1997.

While Australian animal production industries have considered and implemented voluntary measures to address hazards in animal feeds, the regulatory framework has identifiable gaps. Controls over animal feeds across domestic jurisdictions are very variable and there is no current Commonwealth statutory structure to deal with imports of animal feeds beyond the scope of specific quarantine concerns.

The Australian Government red meat industry partnership, SAFEMEAT, recently endorsed a proposed national framework for managing food safety risks associated with stockfeeds. In March 2005, PISC agreed that the Primary Industries Health Committee (PIHC) would establish a working group to examine and evaluate components of a proposed framework for addressing the issue of animal feed controls in Australia. The working group will determine the scope of the framework for national feed standards ensuring coverage of terrestrial and aquatic animal production. Reference will be made to existing animal feed standards to ensure the standard is applied Australia-wide and is effective in controlling all known or anticipated hazards of concern in animal feeds.

***Action for the Australian Government:***

***Work with Australian animal production industries to support implementation of voluntary measures to address hazards, including dioxins, in animal feeds.***

***Establish a working group to examine and evaluate components of a proposed framework for addressing the issue of animal feed controls in Australia.***

**5.10 FOOD**

FSANZ, working in partnership with Australia's Commonwealth, State and Territory governments and the New Zealand Government, protects the health and safety of the people in Australia and New Zealand by maintaining a safe food supply. A key activity for FSANZ is monitoring the food supply to ensure that existing food regulatory measures provide adequate protection of consumer health and safety. The Australian Total Diet Survey (ATDS) is part of that monitoring.

The ATDS estimates Australian consumers' dietary exposure to substances found in the food supply through the testing of food samples collected from around Australia that are representative of the total

diet. In order to achieve more accurate dietary exposure estimates, the foods examined in the ATDS are prepared to a 'table ready' state before they are tested.

The samples collected for the 20th ATDS in 2000/2001 were analysed for dioxins. These results were then combined with dietary information from the 1995 National Nutrition Survey to assess the population's dietary exposure. The resulting dietary exposure assessment contributed to the overall dioxin human health risk assessment conducted by the Department of Health and Ageing as part of the NDP (NDP Technical Report No 12).

For the general population, over 95% of exposure to dioxins is through the diet, with foods of animal origin such as meat, dairy products and fish being the main sources.

An Australian Tolerable Monthly Intake (TMI) value for dioxins and furans of 70 pg TEQ/kg body weight/month, was recommended by the Therapeutic Goods Administration and the National Health and Medical Research Council in 2002. This level was based on the most sensitive reproductive effects of dioxins in animals. The recommended TMI from all sources combined and including dioxins, polychlorinated furans and dioxin-like PCBs, is equivalent to that set by the Joint Expert Committee on Food Additives (JECFA), a committee of the United Nations Food and Agriculture Organization (FAO) and the World Health Organization (WHO). The human health risk assessment found that for Australians aged 2 years or older, the monthly intake of dioxins was between 3.9-15.8 pg TEQ/kg bw/month or between 6-23% of the TMI. Since the completion of the Human Health Risk Assessment of Dioxins in Australia, the Therapeutic Goods Administration has considered available information published post 2002 and found no evidence that would suggest the Australian TMI should be updated at this stage.

As there are limitations associated with the data used to characterise the risk associated with exposure to dioxins from food, in general, conservative assumptions were used to minimise the possibility that risks would be underestimated. On the basis of this analysis the public health and safety risk for all Australians from exposure to dioxins from foods is very low.

The results and recommendations of the National Dioxins Program's human health risk assessment were considered by the Food Regulation Standing Committee (FRSC) in June 2005. FRSC acknowledged that source-directed measures that reduce the release of dioxins into the environment are the most appropriate means of ensuring a long term reduction in the exposure of Australians to dioxins, including through food. Given the current low public health risk, FRSC agreed that setting maximum levels (MLs) and generally expected levels (GELs) for dioxins in food is not appropriate at this stage. However, FRSC supports the repeat of the National Dioxins Program's dioxin dietary exposure survey in ten years, contingent on future decisions about funding and the lead agency. Should a future survey show that source-directed measures have been ineffective at reducing dioxin levels in foods, FRSC will give further consideration to establishing levels for dioxins in food.

***Action for the Governments:***

***Subject to resources, give consideration to undertaking a study in ten years to determine if dioxin levels in food have remained low***

***Consider setting maximum levels or generally expected levels for dioxins in food, should a future survey reveal that source-directed measures have been ineffective at reducing dioxin levels in foods..***

## 5.11 OTHER ACTIONS

The Australian Government is also investigating possible legislative avenues with which it can address dioxins in the environment, to ensure the discharge of Australia's obligations under the Stockholm Convention. One suggested legislative avenue is through approval being required under the *Environment Protection and Biodiversity Conservation Act 1999* for dioxin emissions above a particular level or resulting from particular activities.

***Action for the Australian Government***

***Continue to investigate possible legislative avenues with which it can address dioxins in the environment, as obliged under the Stockholm Convention.***

# 6. WHAT MEASURES DO OTHER COUNTRIES HAVE FOR DIOXINS?

Some countries have implemented standards or levels for dioxins in air, water, soil and other areas including daily human exposure (tolerable daily intake) and levels in food. Examples of the range of guidelines are shown in Table 3 while further information on the range of measures in some countries is provided in Appendix 1.

**Air**

For emissions from combustion facilities, many countries have adopted the level of 0.1 ng TEQ/$m^3$ recommended by the World Health Organization (WHO). However, some countries, such as Canada, have set different levels for different industry sectors whether they are new or existing. The USA has a level of 0.2 ng/$m^3$ and Japan has limits between 0.1 and 5 ng TEQ/$m^3$.

**Soils**

There are no common international guidelines for dioxins in soils. Where countries have established guidelines the levels vary according to the land use. Levels in agricultural and residential areas tend to be lower than levels for industrial areas.

**Water and sediments**

As dioxins are insoluble in water they are very difficult to analyse. Accordingly, very few countries have set guidelines for dioxins in water. However, some countries have set levels for dioxins in sediments with different levels for marine and freshwater.

**Biota**

Few countries have established guidelines for dioxins in biota. Canada has set levels for mammals and birds.

**Foods**

There are no common international guidelines for dioxins in foods. The EU has developed standards in EU Regulation (EC) No. 2375/2001 but these only refer to dioxins and furans and do not include dioxin-like PCBs. It is expected that in the future, a new EU standard will encompass dioxin-like PCBs.

**Human body burden**

A number of countries have established human exposure standards for dioxins, generally referred to as tolerable daily or weekly intakes. Current or proposed tolerable daily intakes (TDIs) range from 1 pg TCDD/kg bw (the Netherlands and Germany), through 4 pg/kg bw (Japan), 5 pg TCDD/kg bw (Sweden, Norway, Finland and Denmark), to 10 pg TCDD or TEQs/kg bw (UK and Canada).

**Table 4: Examples of dioxin guideline levels in other countries**

| **AIR**[5] | **Levels expressed in TEQs**[6] |
|---|---|
| Canada | 0.1 ng/$m^3$ |
| UK | 1.0 ng/$m^3$ |
| Ireland | 0.1 ng/$m^3$ |
| US | 0.2 ng/$m^3$ |
| Japan | 0.1-5 ng/$m^3$ |
| **SOILS** | |
| | |
| Canada | 4 ng/kg |
| USA | 1000 ng/kg |
| Japan | 1 ng/kg |
| Finland | 2 ng/kg |
| Germany | 1000 ng/kg |
| Italy | 5000 ng/kg |
| The Netherlands | 1000 ng/kg |
| Sweden | 250 ng/kg |
| **WATER** | |
| UK | 0.01 ng/L |
| US | 0.3 ng/L |
| Japan | 0.001 ng/L |
| **SEDIMENTS** | |
| UK | 55 ng/kg – saltwater and freshwater |
| Japan | 150 pg/g |
| The Netherlands | 100 ng/kg |
| **HUMAN INTAKE** | |
| Canada | 10 pg TEQ/kg bodyweight (bw)/day |
| UK | 10 pg TEQ/kg bw/day |
| USA | 0.006 pg TEQ/kg bw/day |
| Japan | 4 pg TEQ/kg bw/day |
| Austria | 10 pg TCDD/kg bw/day |
| Denmark | 5 pg TCDD/kg bw/day |
| Finland | 5 pg TCDD/kg bw/day |
| France | 1 pg TCDD/kg bw/day |
| Germany | 1 pg TCDD/kg bw/day |
| Italy | 10 pg TCDD/kg bw/day |
| The Netherlands | 1pg TCDD/kg bw/day |
| Sweden | 5 pg TCDD/kg bw/day |

[5] Levels shown for air are emission limits for sources.

[6] Countries express the levels of dioxins in different units. To assist in enabling comparisons, the levels for environmental media are shown in ng/$m^3$ or ng/kg and in pg/kg for human intake.

# Appendix 1: Dioxin measures in other countries

## *New Zealand*

In 1995, the New Zealand Ministry for the Environment (MfE) commenced a National Organochlorines Program. The Program assessed the extent of contamination of the New Zealand environment by certain organochlorines including polychlorinated dioxins and furans. The scientific and other reports arising from the Organochlorines Program can be viewed on the MfE's website at http://www.mfe.govt.nz/publications/hazardous/#organochlorines.

Surveys were undertaken of the background level of organochlorines, including dioxins, in environmental media (air, soil, fresh water, estuaries and sediment). The level of dioxins found in the New Zealand environment are generally low compared to other (northern hemisphere) countries for which comparable data has been collected. An inventory of dioxin emissions to air, land, water and reservoir sources has been compiled; a market basket survey of the level of organochlorines in retail foods enabled New Zealanders' dietary intake to be assessed; and a major population-based survey of the levels of dioxin and other organochlorines in the serum of New Zealanders was also undertaken. On the basis of the serum study a dioxin health risk appraisal was undertaken for the New Zealand population.

### Air

In October 2001, the MfE released a proposal, *Action Plan for Reducing Discharges of Dioxins to Air*, containing a draft national environmental standard to regulate dioxin emissions from industrial facilities. The original dioxin-specific proposal has now been superseded and integrated into a package of proposed regulations to improve general ambient air quality in respect to other air toxics, including dioxins. Certain combustion activities are to be prohibited, including the open burning of tyres and oil, landfill fires, road-seal burning, new high temperature hazardous waste incinerators, school and hospital incinerators, and the burning of coated wire to recover metals.

### Water

A survey of New Zealand's riverine and estuarine environments showed them to be relatively free of dioxins, and markedly lower than concentrations reported in other developed countries.

### Soil

There are existing interim soil acceptance criteria for dioxins contained in the Health and Environment Guidelines for Selected Timber Treatment Chemicals (Ministry for the Environment and the Ministry of Health, 1997). It is anticipated that these will be reviewed in tandem with work planned in Australia to develop a possible contaminated soil NEPM for dioxin.

### Body

The Ministry of Health in 2002 adopted a new dioxins exposure Interim Maximum Monthly Intake (IMMI) value of 30 pg TEQ/kg body weight/month (approximately 1 pg TEQ/kg body weight /day). This value was established as a result of a WHO reassessment of toxicological data for dioxins. The IMMI represents an approximately 10-fold reduction from what was previously considered to be an "acceptable" level of dioxin exposure. The dioxin criteria recalculation followed the methodology, exposure scenarios and exposure assumptions used in the 1997 Guidelines to derive soil acceptance criteria but replacing the former TDI with the IMMI. In relation to New Zealand, estimated intakes are believed to be currently lower than the WHO range for most of the population, though they appear to have been higher in earlier years.

## ***Canada***

Under the *Canadian Environmental Protection Act* (CEPA), the federal *Toxic Substances Management Policy* and the Canadian Council of Ministers of the Environment's (CCME) *Policy for the Management of Toxic Substances*, dioxins are targeted for 'virtual elimination'[7] in the Canadian environment.

In April 1996, the Deputy Minister's Committee of the CCME gave its approval for a task force to work towards assembling the *Canadian Environmental Quality Guidelines* that integrated national environmental quality guidelines for water, soil, sediment, tissue residue and air. The *Canadian Environmental Quality Guidelines* represents the culmination of more than a decade of harmonised, national science-based development work in Canada.

Determination of the Canada Wide Standards (CWS) has focused on anthropogenic sources that are releasing dioxins and furans to the atmosphere and soil in a continuous process. Development of the CWS for dioxins and furans takes into consideration environmental benefits, available technologies, socio-economic impacts, opportunities for pollution prevention and collateral benefits from reductions in other pollutants.

In January 1999 the Federal/Provincial Task Force on Dioxins released the first *Dioxins and Furans and Hexachlorobenzene Inventory of Releases* followed by a revised update published in February 2001, which identified six priority sectors accounting for about 80% of national emissions that have been identified as priorities for action. These are:

- waste incineration
- burning salt laden wood
- residential wood combustion
- iron sintering
- electric arc furnace steel manufacturing
- conical municipal waste combustion.

### Air

The CWS, under the *Canadian Environmental Quality Guidelines* for pulp and paper boilers burning salt-laden wood, sets out numeric targets and timeframes for reducing dioxin and furan emissions from new and existing boilers. The dioxin and furan standard for all existing pulp and paper mill boiler emissions will be 0.5 ng/$m^3$ by 2006 and the standard for new pulp and paper mill boilers will be 0.1ng/$m^{3.}$

### Water

There are currently no standards for dioxins in freshwater and marine environments.

### Soil

Dioxin and furan contamination in soil is the subject of national guidelines. These guidelines outline ambient or "alert levels" which may be used by jurisdictions as benchmarks for the management and

[7] Virtual elimination is the reduction of releases to the environment of the most dangerous toxic substances to a level below which these releases cannot be accurately measured.

monitoring of dioxins and furans present in the environment. The CWS process has focussed on anthropogenic sources that release dioxins and furans to soil in a continuous process. The development of the standard for dioxins and furans takes into consideration environmental benefits, available technologies, socio-economic impacts, opportunities for pollution prevention and collateral benefits from reductions in other pollutants.

The levels for dioxins and furans in sediment and soil are as follows:

| **Sediment** | |
|---|---|
| - Freshwater (Interim Sediment Quality Guideline – ISQG) | 0.85 ng/kg |
| - Freshwater (Probable Effect Level – PEL) | 21.5 ng/kg |
| - Marine (ISQG) | 0.85 ng/kg |
| - Marine (PEL) | 21.5 ng/kg |
| **Soil** | 4 ng/kg |

**Other**

The Canadian standard for dioxins and furans in wildlife tissue residue is 0.71 ng/kg for mammals and 4.75 ng/kg for birds.

Canada has also established a tolerable daily intake for dioxins and furans of 10 pg/kg bodyweight per day for people.

***United Kingdom***

The UK Environment Agency's Strategy, *Managing Chemicals for a Better Environment,* focuses the Agency's chemical management activities on those substances where the Agency can take action to most effectively contribute to environmental improvement. This action may be direct or indirect and may be at any point in the chemical lifecycle. The strategy focuses on chemicals that may directly affect the environment or human health through environmental exposure.

The Environment Agency is currently looking at the risk a chemical poses on the environment; this requires consideration of two factors:

- the hazardous properties of the chemical – e.g. its toxicity
- the likelihood of exposure to that chemical – for example, environmental exposure is likely to be higher for a chemical in wide use across society (e.g. a substance in a domestic cleaning product) than it will be for a chemical used in a few specialist applications at a few chemical plants.

Dioxins have been identified as a group of chemicals listed for further investigation.

The Environment Agency seeks to regulate releases to the environment of dioxin emissions and lower the risk of causing detrimental effects to the environment or human health.

**Air**

In the UK, dioxin emissions are controlled under the *Pollution Prevention and Control Regulations,* under the *Pollution Prevention and Control Act 1999.* The proposed new European incineration directive will replace three existing directives on the incineration of municipal and hazardous waste, amongst other things, setting a maximum dioxin emission limit of 0.1 ng/$m^3$ in stack gas. For

combustion processes the recommended limit value is 0.1 ng/m$^3$ and for various metal processes and papermaking processes, the recommended limit is 1.0 ng/m$^3$.

**Water**

The UK standards for dioxins in water are:

| | |
|---|---|
| Freshwater pelagic community | 0.01 ng/l |
| Saltwater pelagic community | No standard |
| Freshwater sediment benthic community | 55 ng/kg (for 3% OC) |
| Freshwater sediment benthic community | 185 ng/kg (for 10% OC) |
| Marine sediment benthic community | 55 ng/kg (for 3% OC) |

Note: OC – Octachlorodibenzo-*para*-dioxin

Pelagic communities are those that live in the water (below the surface and above the seafloor)

Benthic communities are those that live in or on sediments.

**Soil**

There are currently no standards for levels of dioxins or furans in soil.

**Other**

The UK Ministry for Agriculture, Fisheries and Foods has established a recommended maximum tolerable concentration of 0.66 ng/kg for dioxins in cows milk.

The UK has adopted a tolerable daily intake for dioxins and furans of 10 pg/kg bodyweight per day for people.

***United States***

Over the last 20 years, the US EPA has looked for ways to reduce dioxins levels in the environment. Collectively, these actions have resulted in strict controls on all known and quantifiable major industrial sources of dioxin releases. As a result of the EPA's efforts, along with efforts by state government and private industry, known and quantifiable industrial emissions of dioxins in the US have been reduced by more than 90% from 1987 levels.

The EPA undertook a major scientific study entitled, *Exposure and Human Health Reassessment of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin (TCDD) and Related Compounds.* The study is commonly referred to as the EPA dioxin reassessment. The study focuses on sources of dioxins, levels of dioxin-like compounds in environmental media, human exposures to dioxins, information on critical human health end points, mode of action, pharmacokinetics, dose-response and finally, key findings pertinent to the potential hazards and risks of dioxins, including a discussion of all important assumptions and uncertainties.

**Air**

New stringent regulatory requirements promulgated by the EPA under the authority of the *Clean Air Act* set emission limits for dioxins, and other hazardous air pollutants based on maximum achievable control technology. The EPA has recently regulated dioxin emissions from facilities that burn hazardous waste which include waste incinerators, cement kilns and some lightweight aggregate kilns. For example, the limit for discharges of dioxins and furans from municipal waste incinerators is 0.2 ng/m$^3$.

**Water**

Dioxin releases to water are managed through a combination of risk-based and technology-based tools established under the *Clean Water Act*. To maintain the level of drinking water in the country, a maximum contaminant level goal (non-enforceable, voluntary health goal) of zero and a maximum contaminant level of 300 pg/L has been set.

**Soil**

Under the EPA Superfund, an important aspect is the clean up of dioxin contaminated lands. Around the country there are many Superfund sites which have successfully been cleaned up, however, to prevent further contamination of dioxins to land, the EPA has developed Hazardous Waste Identification and Disposal Rules which identify and strictly limit the disposal options of waste containing dioxins.

The US Public Health Service and the EPA have both issued a directive that 1000 ng/kg is the appropriate criterion to use for dioxins and furans in residential soil.

**Wastes**

The EPA proposed rules to restrict the use of dioxin-contaminated pulp and paper sludge and guidelines have been developed to limit the dioxin concentration to 31.9 pg/L.

The EPA proposed regulations limiting the dioxin content of cement kiln dust from cement plants and sludge when these by-product materials are used as soil additives.

In October 2003, the US EPA made the decision not to regulate dioxins in land-applied sewage sludge as studies have shown that dioxins from this source do not pose a significant risk to human health or the environment.

**Other**

The US EPA has set limits on the level of human exposure of dioxins at 0.006 pg/kg bodyweight per day.

***Japan***

The Law Concerning Special Measures Against Dioxins (the Dioxins Law) came into force in January 2000 to regulate the levels of dioxins in air, water and soil as well as emissions from small incinerators. This law also stipulates basic standards for dioxins in soil. The Dioxins Law stipulates the standards for dioxins as:

| | |
|---|---|
| Ambient Air | 0.6 pg-TEQ/$m^3$ |
| Water | 1 pg-TEQ/L |
| Sediment | 150 pg-TEQ/g |
| Soil | 1,000 pg-TEQ/g |
| Effluent | 10 pg-TEQ/L |
| Tolerable Daily Intake | 4 pg-TEQ/kg bw/day |

***European Union***

The cornerstone of the EU environmental action is the Sixth Environment Action Program entitled *Environment 2010: Our Future, Our Choice* which has the priorities of:

- tackling climate change and global warming
- protecting the natural habitat and wildlife
- addressing environment and health issues
- preserving natural resources and managing waste.

In October 2001, to secure better protection of human health and the environment from the effects of dioxins the Commission adopted a *Communication on a Community Strategy for Dioxins, Furans and Polychlorinated Biphenyls*. The Communication outlines the problem of dioxins, the progress in addressing the problem, the remaining gaps, the basis for community action and develops a strategy to reduce the presence of these compounds in the environment, in feed and food.

Table 4 describes the current guidelines for dioxins applied within Member States of the EU.

**Table 5: Current standards and guidelines for dioxins in the Member States of the EU**

| Country | Incineration of Waste Emissions (I-TEQ/$m^3$) | Iron/Steel Sintering Emissions (I-TEQ/$m^3$) | Paper Processing Emissions | Contaminant Soils (I-TEQ/kg) | Water | Fertiliser / Compost (I-TEQ/kg) | Sewerage Sludge | Foodstuffs (TCCD/g) | Daily Human Intake |
|---|---|---|---|---|---|---|---|---|---|
| **Austria** | 0.1 ng | Before 31 Dec 2005 – 0.25 ng<br>After 1 Jan 2005 – 0.1 ng<br>(Electrical arc furnaces 0.4 ng) | | No guidelines – in the past were applied to individual cases and were same level as Germany | N | Fertiliser – 50 ng<br>Culture substrates – 20 ng | 100 ng I-TEQ/kg | 3 ng I-TEQ/kg (feed stock to cows) | 10 pg TCCD/kg/bw (A target of 1 pg should be achieved) |

## Appendix 2: Comments received on the draft NAP from public consultation

| No. | Name and contact details | Comments | Response |
|---|---|---|---|
| 1 | Samuel Barber<br>General Manager<br>Redbank Power<br>PO Box 311<br>SINGLETON NSW 2330 | There is mixed discussion on the highest emitters of dioxins – section 1.2 implies that power generation, waste incineration and metal smelting are the major contributors, yet in section 2 it shows that uncontrolled and controlled combustion of biomass and forests are the major sources of dioxins. | Section 1.2 has been revised to address this comment. |
| 2 and 11 | Colin Trinder and<br>Apares Chakrabarti<br>Environmental Stewardship<br>Department of Defence<br>Brindabella Park Offices<br>CANBERRA AIRPORT ACT | There is no mention about open air burning for disposal of munitions, explosives and packaging as a potential source of dioxins. | Open air burning of munitions, explosives and packaging is not listed as a source of dioxins in the Stockholm Convention on Persistent Organic Pollutants. The Department of the Environment and Heritage (DEH) will discuss this matter with the Department of Defence and UNEP. |
| | | Defence has specific requirements to dispose of specialised chemicals by burning, for which no alternative technology is available at present. Defence will assist in developing the Best Available Technology (BAT) and Best Environmental Practice (BEP) to replace the conventional burning methodology and assist in the areas of evaluation and testing of technology and practice. | DEH will seek the Department of Defence's advice on this area for input into international work on developing BAT and BEP guidelines under the Stockholm Convention. |

| | | | |
|---|---|---|---|
| | | Development of a quick guide (nomograph) to work out the emission of dioxin from burning various substances would assist practitioners to check in advance the expected emission levels at sources promptly and virtually at no cost. This nomograph may also assist the designers to scale up any scrubbing system correctly for the existing facility, where required. | DEH will consider this suggestion in preparing Australia's input into international work on developing BAT and BEP guidelines under the Stockholm Convention. |
| | | For more precise determination of the emissions level, appropriate measurement techniques should be developed and some guidance on how to control emissions would be desirable. | DEH will consider this suggestion in preparing Australia's input into international work on developing BAT and BEP guidelines under the Stockholm Convention. |
| | | The lab facilities of testing and analysis must be available in Australia at an affordable cost for the success of this program | The National Measurement Institute is the only laboratory in Australia that is NATA accredited to undertaken dioxin analysis. |
| | | Some thoughts need to be given in regard to how to fix the contamination that has already occurred in air, soil and groundwater, as a result of dioxin being generated unintentionally over centuries (legacy sites). | The National Environmental Protection (Assessment of Site Contamination) Measure provides a nationally consistent approach for assessing contaminated sites. This NEPM is currently under review. |
| | | It is not clear how dioxin will interact in the atmosphere and its fate and transportation characteristics in air, soil and groundwater. It is also not clear how dioxin may impact on human health and enter into the environment, including flora and fauna and its exposure pathways. | As the information addressing these matters is discussed in the National Dioxins Program Technical Reports on Ecological Risk Assessment and Human Health Risk Assessment for Dioxins it was considered unnecessary to repeat this information in the National Action Plan. However, section 1.1 has been amended to include a reference to these reports. |
| | | Very little is known about the epidemiological characteristics of dioxin and the methodology for estimation of human health risks. Some guidance may be useful. | As the information addressing these matters is discussed in the Human Health Risk Assessment for Dioxins it was considered unnecessary to repeat this information in the National Action Plan. |

| | | | |
|---|---|---|---|
| | | More information on the acceptable ecological levels particularly for soil, groundwater, plant ingestion and plant uptake would be helpful. More guidance would be needed for the assessment, management and risk based remediation of dioxin related contamination, and development of EIL, HIL and acceptance criteria for clean up. | These comments will be referred to the current review of the Assessment of Site Contamination NEPM. |
| 3 | Jeffrey Rabbidge<br>Principle Environmental Scientist<br>Environmental Resources Management Australia<br>PO Box 1400<br>SPRING HILL QLD 4004 | Sections 5.2-5.4 soils, water, sediment<br>In determining levels for soils, water and sediment, conventional derivation protocols and techniques should be used, however, data may already be available overseas to derive these trigger levels. The methodology will need to be transparent and available to the general public and need to take into account background levels of exposure from other sources. | The comments related to soils will be referred to the current review of the National Environment Protection (Assessment of Site Contamination) Measure 1999.<br>The comments on water and sediment would be considered in future reviews of the Australian and New Zealand Guidelines for Fresh and Marine Water Quality. |
| | | Section 5.5 Biota monitoring<br>It should be acknowledged that the fauna study (NDP Technical Report No. 7) is statistically challenged and of very limited utility for determining current concentrations of dioxins in Australian fauna or for use in comparisons of temporal trends over time. Further studies are required for these purposes. | The comments on surveying dioxins in biota would be considered should further studies be undertaken in future. |

| | | | |
|---|---|---|---|
| | | Further studies on biota might potentially provide information on the levels of dioxins in Australian biota, and whether source-directed measures are having an effect at reducing these levels. However, such monitoring source-directed measures should only be considered when it could be statistically robust, specific to a known source, not diluted within ambient variability or influenced by historical sources. The time scale for detecting change could be extensive given the lengthy environmental persistence of these chemicals. It might be possible to exclude historical sources of dioxins from confounding monitoring programs, or incorporating this variability into the study, if that is the question to be addressed by the study. | The comments on surveying dioxins in biota would be considered should further studies be undertaken in future. |
| 4 | Richard Hoy<br>Energy Supply Association of Australia<br>2/451 Little Burke Street<br>MELBOURNE VIC 3000 | Section 3 - include a note about the cooperation of industry in monitoring and reducing dioxins emissions | Section 3 has been amended to reflect these comments. |
| | | Section 4 - clarify description of the term BAT/BEP | Section 4 has been amended to reflect these comments. |
| | | Section 5.1 - include a table showing sources of dioxins in Australia e.g. a table from the National Dioxins Program, Technical Report no 3 'Inventory of Dioxin emissions in Australia'. | A table has been included in the Appendices. |
| 5 | Volker Maier<br>Nufarm<br>103 Pipe Road<br>LAVERTON NORTH VIC 3026 | Section 5.1 – a national guideline of 0.1ng TEQ/$m^3$ should be set for NEW combustion facilities. Setting a guideline for all facilities, including existing, will result in a large amount of high cost analysis and lead to existing facilities exceeding limits. | The proposed action related to guidelines has been amended to include reference to new facilities and existing facilities when they are upgraded. |
| | | Section 4 - text about BAT/BEP needs to be consistent with Article 5 of the Stockholm Convention | Section 4 has been amended to reflect these comments. |

| | | | |
|---|---|---|---|
| | | Section 5.2 - For contaminated sites, a single investigation level could cause unnecessary investigation and actions for industrial site. There should be encouragement to use 'indicators' pointing to potential dioxin contamination. If this is not included, then the potential is that just about every land transfer will call for dioxin analysis; a totally unnecessary cost burden on the community. | Section 5.2 - comments related to soils will be referred to the current review of the Assessment of Site Contamination NEPM. |
| 6 | Combined submission from following environment groups:<br>Allergy, Sensitivity and Environmental Health Association<br>Alliance for a Clean Environment<br>Contaminated Sites Alliance<br>Greenpeace Australia Pacific<br>National Toxics Network<br>Total Environment Centre<br>WWF Australia | Elimination of POPs: Elimination rather than control of all POPs must be the goal. Prevention and phase-out programs must be prioritised, rather than end-of-pipe measures. | It is not feasible to completely eliminate all production of dioxins. |
| | | Section 5.11 - Environment Protection and Biodiversity Conservation Act trigger: The Environment Protection and Biodiversity Conservation Act (Cth) (EPBC Act) should be amended to include a trigger for the Stockholm Convention. | The inclusion of a trigger for dioxins under the EPBC Act will be considered as part of the review to determine if additional matters of national environmental significance should be included in the Act. |
| | | Principles of substitution and elimination: The substitution principle (substitute materials, products, and techniques) must be implemented to prevent formation and release of POPs. Priority must be given to avoiding and preventing new facilities that yield unintentional POPs by-products (e.g. dioxins), while phasing out existing ones. | The BAT and BEP guidelines being developed under the Stockholm Convention promote the use of alternative processes, products and techniques aimed at reducing and where feasible, eliminating dioxin releases. |
| | | Section 5.1 - Avoiding and phasing out incineration: Incineration must be avoided and phased out through alternative waste management. | The BAT and BEP guidelines being developed under the Stockholm Convention promote the use of alternative processes, products and techniques aimed at reducing and where feasible eliminating dioxin release. |

| | | | |
|---|---|---|---|
| | | Section 5.6 - Requirement of totally chlorine free pulp mills: All bleached pulp mills should be totally chlorine free (TCF). Pulp mills that are elemental chlorine free (ECF) or require the use chlorine should be phased out and the construction of new mills that use chlorine or chlorine compounds banned. | The Stockholm Convention draft BAT and BEP guidelines for pulp production does not prescribe a preferred production process. However, it notes that to decrease or eliminate the formation of dioxins in wood and non-wood bleaching processes there are a number of measures which could be adopted including eliminating elemental chlorine by replacing it with chlorine dioxide (elemental chlorine-free bleaching) or in some cases with total chlorine-free processes.<br>Any proposals for new pulp mills would be assessed against the Stockholm guidelines and against the pulp mill guidelines recently revised by the Tasmanian Government. |
| | | Human and environmental monitoring for POPs: A monitoring program must be established to examine the body burden of POP chemicals. | Future monitoring of dioxins would be undertaken subject to funding resources. The Food Regulation Standing Committee would support the repeat of the dioxin dietary exposure survey in ten years. |
| 7 | Kimberly-Clark Australian Pty Limited<br>Dr Harley Wright<br>52 Alfred Street<br>MILSONS POINT NSW 2061 | Section 5.1 - The principle for adoption the level of 0.1 ng $m^3$ be reassessed and substantiated, as this limit is not based on risk-based considerations, rather based purely on potentially achievable technical levels. The risk of harm should be the key principle for setting acceptable ambient dioxin concentrations. Question the adoption of the level of 0.1 ng $m^3$ on the basis that it has been accepted internationally. If the ambient levels do not exceed the unacceptable threshold, a case will need to be made if levels are to be prescribed for specific emitters. If there is not a problem, there would seem no basis for regulation. | The level of 0.1 ng $m^3$ for dioxins has been accepted internationally as a goal for achieving best practice for controlling emissions of dioxins from combustion sources. Most states and territories have either formally or informally adopted this level already.<br>Monitoring of ambient levels of dioxins will impose higher costs on the community. |
| | | Section 5.3, 5.4 and 5.10 - Support the principle of using acceptable risk as the basis for setting maximum ambient levels in food and water and sediments. | These comments would be considered in future surveys of food and in reviews of the Australian and New Zealand Guidelines for Fresh and Marine Water Quality.. |

| | | | |
|---|---|---|---|
| | | Section 4 - We recommend that the principles for imposing a BAT limit on dioxin emissions be carefully assessed and provided. They should incorporate a consideration of the risks, the costs and the benefits. | BAT is an accepted approach to setting dioxin emission limits and is followed in most jurisdictions. |
| 8 | Carter Holt Harvey Limited<br>Murray Parrish<br>640 Great South Road<br>Manukau City<br>AUCKLAND NEW ZEALAND | Section 4 - Concerned that the regulatory effort directed toward dioxin assessment and review is disproportionate to the actual risk of dioxin in Australia and relative to other environmental risks. As there are low risk of environmental and health effects, the continued decline in emissions of dioxins and the high cost of monitoring for dioxins combine to suggest that new or additional regulation of dioxins in Australia is unwarranted. | The approach adopted takes these considerations into account. |
| | | Review Australia's National Dioxins Program to place greater emphasis on the environmental effects of any particular discharge of dioxin. References to 'permissible' levels of dioxin emission should be deleted in favour of references to adoption of BAT and BEP determined in the context of the particular emission or discharge. | The current approach is to set emission standards guided by BAT and BEP considerations. This is followed in most jurisdictions. |
| | | Review the report recommendations with respect to dioxin emissions from biomass sources in the context of consequential and other effects adversely increasing if biomass combustion is constrained. | Research currently underway will contribute to improved knowledge about dioxin emissions from bushfires. |
| | | Amend the reports recommendations to reflect the investment being made in particulate emissions regulation and control. | A note about industry contribution to reducing dioxin releases has been included in Section 3. |
| | | The need for direct monitoring and regulation of dioxin should be identified as unnecessary where other factors such as particulate emission regulation will act to constrain dioxin emissions. | This matter should be resolved through the setting of individual licence conditions. |

| | | | |
|---|---|---|---|
| | | Section 5.6 - Amend the proposed actions with respect to dioxin discharges in pulp mill effluent to remove reference to a specific emission level. If particular guidance is required for the management of dioxin from particular sources such as pulp mill waste water, it may be appropriate to define BAT/BEP for that type of discharge, perhaps allowing for a 10 year review of any limit. | The levels for dioxins in pulp mill effluent have been recommended in the recent review by the Tasmanian Government of the Pulp Mill Guidelines. |
| | | Section 5.7 - Does not support dioxin as a reporting obligation under NPI. If national dioxin emissions inventory is required, then we recommend research into the accuracy of determining dioxin emissions by proxy, for example through the measurement reporting of particulate. There is little justification for imposing NPI obligations reporting based on volume thresholds, and the risk of distortion of business decision making to avoid arbitrary thresholds. | Dioxins are currently reported under the National Pollutant Inventory (NPI). A recent review of the NPI has recommended reporting of dioxins in toxic equivalents (TEQs). These comments will be considered in the response to the review. |
| | | Section 5.11 – The National Action Plan identifies that the risk to Australians and Australian Biodiversity from dioxin emissions is low and falling. There therefore appears to be little justification for requiring legislative approval under the Environment Protection Biodiversity Conservation Act 1999 for dioxin emissions. | The inclusion of a trigger for dioxins under the EPBC Act will be considered as part of the review to determine if additional matters of national environmental significance should be included in the Act. |
| | | The report highlights the significant reductions in dioxins emissions at source arising from other regulatory and community health initiatives. | Noted. |

| | | | |
|---|---|---|---|
| 9 | A3P<br>Miles Prosser<br>Level 3, Tourism House<br>40 Blackall Street<br>BARTON ACT 2600 | The Action Plan should be comprehensive in its scope and continue the current path towards a steady reduction in the already low level of dioxin emissions, including through encouraging low dioxin emissions at the time of investment or upgrade of industrial plants. | Agreed. This is the approach adopted by the Action Plan. |
| | | The Plan should avoid costly measurement regimes and enforcing emission levels in existing facilities that will be replaced by cleaner technology in the normal capital replenishment cycle. A3P supports guideline ambient levels based on risk assessment. | Ambient levels are not usually used for regulating dioxins. Measurement requirements for industry are a matter for individual licences. |
| | | Setting dioxin emission levels for point sources and then presumably requiring some form of monitoring and reporting to ensure compliance could create a substantial cost for industry. Significant costs seem out of proportion given that dioxin levels are currently low and existing Government actions appear to be driving them lower. | Measurement requirements are a matter for individual licences. Emission levels are already party of policy and/or practice in most jurisdictions. |
| | | Section 5.1 - The proposal to set a blanket emission level for dioxins to air of 0.1 ng TEQ/m3 seems unjustified. It does not seem to be based on likely risk from such a level. A3P considers that risk assessment should be the primary basis for action. | The level of 0.1 ng/$m^3$ for dioxins has been accepted internationally as a goal for achieving best practice for controlling emissions of dioxins from combustion sources. Most states and territories have either formally or informally adopted this level already. |

| | |
|---|---|
| Section 5.1, 5.3 and 5.4 - It is recommended that where the plan proposes to "consider including a level for dioxins", for both ambient levels and emissions, that this be limited by: "if it can be demonstrated that the benefits of including a level exceed the costs of measurement, reporting and compliance". Furthermore, there should either be an additional action (or existing actions should be expanded) to include: "To enable efficient monitoring and compliance, methods should be developed that allow the estimation of dioxin emissions based on process, technology and activity levels" rather than laboratory analysis. | The level of 0.1 ng/$m^3$ for dioxins has been accepted internationally as a goal for achieving best practice for controlling emissions of dioxins from combustion sources. Most states and territories have either formally or informally adopted this level already. |
| Section 5.1 - A similarly flexible approach should be employed in the National Dioxins Plan given the potentially high cost of determining whether existing facilities meet the proposed level and the additional cost of re-engineering if required. A flexible approach would seem particularly appropriate given the current low dioxin levels. | The level of 0.1 ng/$m^3$ for dioxins has been accepted internationally as a goal for achieving best practice for controlling emissions of dioxins from combustion sources. Most states and territories have either formally or informally adopted this level already. |
| Section 5.1 - It is recommended that the proposed action on national guidelines for dioxins emissions from combustion facilities be expanded to include: "The guidelines should allow flexibility. They should consider the relative contribution of each source and the costs of compliance particularly when applied to existing facilities." | The level of 0.1 ng/$m^3$ for dioxins has been accepted internationally as a goal for achieving best practice for controlling emissions of dioxins from combustion sources. Most states and territories have either formally or informally adopted this level already. |
| A3P is supportive of the overall approach outlined in the National Action Plan for addressing dioxins in Australia. | Noted. |

| | | | |
|---|---|---|---|
| | | The greatest reductions in dioxins will be achieved through the application of Best Available Techniques and Best Environmental Practices for new facilities and upgrade of existing facilities. | Agreed. |
| 10 | Food Regulation Standing Committee<br>C/-Department of Health and Ageing<br>GPO Box 9848<br>CANBERRA ACT 2601 | Section 5.10 - Given the current low public health risk associated with food sources, the Food Regulation Standing Committee (FRSC) decided that setting maximum levels and generally expected levels for dioxins in food is not appropriate at this stage. | Section 5.10 has been amended to reflect this decision. |
| | | Section 5.10 - FRSC would support the repeat of the dioxin dietary exposure survey in ten years, contingent on future decisions about funding and the lead agency. Should a future survey show that source-directed measures have been ineffective in reducing dioxin levels in foods, FRSC will give further consideration to establishing levels for dioxins in food. | Section 5.10 has been amended to reflect this decision. |
| 11 | See comments under 2 | | |
| 12 | Clean Air Society of Australia and New Zealand<br>Queensland Branch<br>Dr Ken Verrall<br>449 Whitehorse Road<br>BALWYN VIC 3103 | Section 5.1 - Strongly supports the adoption of the 0.1 ng TEQ/$m^3$ level as a national guideline for dioxin emissions from combustion facilities; however, clarification on the industries covered under this criterion is recommended. | Noted. |
| | | Section 4 - Strongly supports the use of the recommendations in the Stockholm Convention BAT and BEP guidance for new facilities and for existing facilities | Noted. |

| | | | |
|---|---|---|---|
| | | when they are upgraded. | |
| | | Section 5.1 - To improve our knowledge on emissions from Australian industry sources, strongly encourages the use of licence requirements to provide mass emission and concentration data that will assist in improving the knowledge base on emissions from sources shown to have a high level of uncertainty in emission estimates. For example, the zinc production and metal sintering sectors. | The suggestion to use licence requirements to provide mass emission and concentration data can be considered by individual jurisdictions. |
| | | Section 5.1 - Strongly supports the use of existing measures aimed at reducing particle emissions from woodheaters. However, given the recognised health impacts from exposure to woodheater emissions, CASANZ strongly encourages intergovernmental measures and strategies to reduce the overall use of woodheaters, for example restricting woodheater installation in new housing developments and/or phasing out the use of woodheaters within given timeframes. | These suggestions would be considered in the context of activities related to improving the use of woodheaters. |
| | | Section 5.1 - Given the costs associated with dioxin sampling, CASANZ supports the monitoring of overseas research looking at emissions of dioxins from diesel, LPG and CNG vehicles to determine whether further action is required in Australia. | Noted. |
| | | Section 5.1 - Strongly supports further research into dioxin emissions from bushfires to provide firmer evidence on whether bushfires are the actual source, or whether dioxins are re-suspended from the soil during a fire. The research that has been performed in Australia is excellent and CASANZ recommends continued support of research programs to maintain Australia's status as a leading authority. | Research currently underway will contribute to improved knowledge about dioxin emissions from bushfires. |

| | | | |
|---|---|---|---|
| | | Section 5.1 - Supports the detailed study into assessing the relative priority of dioxins, for possible inclusion into the Air Toxics NEPM. | Noted. |
| | | Dioxins have been an emotive issue and CASANZ recommends supporting the Action Plan with public awareness and education programs. | This issue will be taken up in the Stockholm Intergovernmental Forum. |
| 13 | Australasian Fire Authorities Council<br>Mark Chladil<br>GPO Box 1526<br>HOBART TAS 7001 | AFAC members want to see both the positive and negative aspects of smoke resulting from both planned and unplanned use of fire discussed in the development and justification of public policy and so the breadth of the National Action Plan proposals are supported. | Noted. |
| | | AFAC supports the recognition that dioxins will be released from burning vegetation irrespective of the legal or operational status of the fire, and that the release by fire will be inevitable in most vegetation types across the continent. Given the experience of large fires in recent times, it is neither practical nor desirable for the final version of the National Action Plan to become focussed on removal of fire from the landscape. | Noted. |
| | | Improved knowledge about fire and smoke will allow improved management of the smoke from both planned burns and bushfires and AFAC members are committed to using the best practices in their use of fire for land management and in fire suppression. | Noted. |
| 14 | Nick Pastalatzis<br>132 Glengala Road<br>WEST SUNSHINE VIC 3020 | Section 5.1 – the EPHC should be advised when prescribed burning will be taken place to reduce exposure to human health. | The EPHC itself is not in a position to be advised when prescribed burning takes place, but State bushfire authorities work closely with environment protection agencies to ensure hazard reduction control burns minimise the impact on human health. |

| | | | |
|---|---|---|---|
| | | Section 5.8 - To discourage further cigarette smoking, ban the farming of tobacco, specifically in areas adjacent to major river systems such as the Murray and Darling Rivers. | The suggestion to ban tobacco growing is outside the scope of the Dioxins Action Plan. |
| | | Section 1, Table 1 – include a definition of TEF and NATO CCMS | These terms have been included in the glossary. |
| | | Unit of measurement table – include information on levels of dioxins which will impact on human health | This information is discussed in the National Dioxins Program Technical Report on Human Health Risk Assessment for Dioxins. |
| | | Section 5.1 – further public education campaigns should be used to discourage the use of domestic woodheaters. For example, keeping the heated areas to the rooms that are used and ensure better insulation. | State and Territory governments will continue with their campaign to gain further public awareness of the impact of woodheaters on the environment. |

# Acetone

The majority of the following information has been sourced from ATSDR (1994), with other sources listed in the references.

## Chemical Identification

Synonyms: Dimethyl ketone, 2-Propanone, beta-Ketopropane.

CAS: 67-64-1

Molecular Formula: $C_3H_6O$

Molecular Weight: 58.08

## General

Acetone is a colourless liquid that evaporates readily into the air and mixes well with water.

Acetone is a chemical that is found naturally in the environment (e.g. in plants, trees, volcanic gases and forest fires) and is also produced by industries to make other chemicals that make plastics, fibres and drugs. Acetone is also used to dissolve other substances. Acetone can also enter the environment during its manufacture and use, in exhaust from automobiles, and from tobacco smoke, landfills, and certain kinds of burning waste materials.

Low levels are normally present in the body from the breakdown of fat, with the body using it in normal processes that make sugar and fat.

## Significance of Exposure Pathways and Background

The most significant exposure pathway is inhalation of contaminated air, both indoor and outdoor. Although acetone has been detected in certain foods (fruit and vegetables), beverages, tap water and soil, these do not constitute major sources of exposure for most people (ATSDR, 1994).

The bloodstream absorbs acetone rapidly and completely from the lungs and stomach. The bloodstream can also absorb acetone from the skin, but less rapidly than from the lungs and stomach. Blood carries acetone to all body organs (ATSDR, 1994).

Limited information is available regarding background levels of acetone in air, water, and soil. Therefore in absence of compound-specific background exposure data, the background exposure for volatile COPC has been set at 10% in accordance with the total petroleum hydrocarbon (TPH) background exposure allocation used to derive the Health Screening Levels (HSLs) published by CRC CARE (Friebel, E. and Nadebaum, P., 2011).

In absence of sufficient compound-specific absorption data for the oral, inhalation and dermal routes, the absorption for volatile COPC has been set at 100% for oral and inhalation exposure and 20% for dermal exposure in accordance with the absorption allocation adopted during derivation of the HSLs for volatile TPH fractions (Friebel, E. and Nadebaum, P., 2011).

## Non-Carcinogenic Health Effects

Workers and people exposed to acetone in the laboratory have complained that acetone irritated their noses, throats, lungs, and eyes. Those exposed to acetone at 12,000 ppm or higher also complained of headache, light headedness, dizziness, unsteadiness, and confusion depending on how long they were exposed (from 2 minutes to 4 hours). Two workers exposed for four (4) hours became unconscious.

In addition, some people who had casts applied with acetone were exposed to acetone that evaporated into air during and after the casts were applied. These patients became nauseous, vomited blood, and became unconscious. Some people exposed to acetone in the air at about 250 ppm for several hours in the lab had headaches and lacked energy, and they also had some mild behavioural effects. Some people exposed to 500 ppm in the air for several hours in the lab had effects on the blood, but other studies showed no effects on the blood at even higher exposure levels.

People who swallowed acetone or substances that contained acetone became unconscious, but they recovered in the hospital. The amount of acetone that these people swallowed was not always known, but one man swallowed about 2,250 milligrams of pure acetone per kilogram of body weight (2,250 mg/kg). In addition to becoming unconscious, he had tissue damage in his mouth and he later developed a limp, which eventually cleared up, and symptoms similar to diabetes (excessive thirst, frequent urination).

In a lab experiment, people who had liquid acetone applied directly on their skin and held there for a half hour developed skin irritation. When the skin was looked at under a microscope, some of the skin cells were damaged.

Animals briefly exposed to high levels of acetone in the air also had lung irritation and became unconscious; some died. Exposure at lower levels for short periods also affected their behaviour. Pregnant animals that were exposed to high levels of acetone in air had livers that weighed more than usual and had fewer foetuses. The foetuses weighed less than normal and had delayed bone development.

Animals given large amounts of acetone to swallow or drink for short periods had bone marrow hypoplasia (fewer new cells being made), degeneration of kidneys, heavier than normal livers and bigger liver cells, and collapse and listlessness. Pregnant mice that swallowed acetone had lower body weights and produced fewer newborn mice. More of the newborn mice that had swallowed acetone died in comparison to newborn mice that were not given acetone.

Male rats that swallowed or drank even small amounts of acetone for long periods had anaemia and kidney disease. The female rats did not have anaemia, but they had kidney disease when they swallowed a much larger amount of acetone than the male rats swallowed. The female rats had livers and kidneys that weighed more than normal, and so did the male rats, but only when they swallowed larger amounts of acetone than the females swallowed. The male rats also had abnormal sperm. The female rats did not have any effects in their reproductive organs. Rats also had signs that acetone caused effects on their nervous systems.

Acetone is irritating to the skin of animals when it is placed directly on their skin, and it burns their eyes when placed directly in their eyes. Guinea pigs have been reported to develop cataracts in their eyes when acetone was placed on their skin.

One effect of acetone seen in animals is an increase in the amount of certain enzymes (chemicals in the body that help break down natural substances in the body and chemicals that enter the body). The increase in these enzymes caused by acetone exposure can make some chemicals more harmful.

## Identification of Non-Carcinogenic Toxicity Reference Values

The dose-response values provide an estimate of exposure to the human population that is likely to be without an appreciable risk of deleterious effects during a lifetime. The oral exposure represents a daily value and the inhalation exposure represents continuous inhalation. These values are intended for use in risk assessments for health effects known or assumed to be produced through a nonlinear (presumed threshold) mode of action (USEPA, 2013). Available chronic dose-response values published by sources recognised and endorsed by enHealth (enHealth, 2012), NEPC (NEPC, 1999) and the USEPA and are summarised below. Fussy

**Oral**

The oral dose-response value is expressed in units of mg/kg/day. This value may be termed a Reference Dose (RfD), Tolerable Daily Intake (TDI), or Minimal Risk Level for oral exposure (MRL) depending on the agency of derivation.

**Table 1 Published Threshold Dose-Response Values for Acetone - Oral**

| Agency | Oral Dose-Response Value (mg/kg/day) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| NSF International | 0.9 | NSF International (2003) | Nephropathy | Rats | 1000 | RfD. Based on USEPA, 2003. |
| ATSDR | 2 | ATSDR (1994) | Haematological effects | Rats | 100 | Intermediate MRL. Based on studies by Dietz et al., 1991 and NTP 1991. |

| Agency | Oral Dose-Response Value (mg/kg/day) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| IRIS | 0.9 | USEPA (2003) | Nephropathy | Rats | 1000 | RfD. Based on studies by Dietz et al., 1991 and NTP 1991. |

ATSDR – Agency for Toxic Substances and Disease Registry
IRIS – Integrated Risk Information System.
UF – Uncertainty Factor.

**Inhalation**

The inhalation dose-response value is expressed in units of mg/m$^3$. This value may be termed a Reference Concentration (RfC), Guidelines Value (GV), Tolerable Concentration (TC), or Minimal Risk Level for inhalation (MRL) depending on the agency of derivation.

**Table 2 Published Threshold Dose-Response Values for Acetone - Inhalation**

| Agency | Inhalation Dose-Response Value (mg/m$^3$) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| ATSDR | 30.88* | ATSDR (1994) | Neurological effects | Human | 100 | Chronic MRL. Based on study by Stewart et al., 1975 |

ATSDR – Agency for Toxic Substances and Disease Registry
UF – Uncertainty Factor.
* Converted from 13ppm to mg/m$^3$ using the molecular weight of 58.08 and assuming 25ºC and 760 mm Hg

## Carcinogenicity and Genotoxicity

Acetone does not cause skin cancer in animals when it is applied to their skin. It in unknown whether acetone would cause cancer after breathing or swallowing it for long periods because no tests have been conducted. The Department of Health and Human Services and the International Agency for Research on Cancer have not classified acetone for carcinogenic effects. The US EPA has determined that acetone is not classifiable as to its human carcinogenicity.

## Identification of Carcinogenic Toxicity Reference Values

**Oral and Inhalation**

ATSDR and USEPA have evaluated the carcinogenicity data for acetone**.** USEPA determined that under the Draft Revised Guidelines for Carcinogen Risk Assessment (USEPA, 1999), data are inadequate for an assessment of the human carcinogenic potential of acetone**.** This weight-of-evidence determination is based on the availability of one human study of limited utility, no chronic animal studies, and no additional information on structural analogues with known carcinogenic potential. Acetone has tested negative in almost all genotoxicity studies. The previous IRIS assessment included a weight of evidence classification of Group D - not classifiable as to human carcinogenicity - based on the Guidelines for Carcinogen Risk Assessment (USEPA, 1986). ATSDR has published a Toxicological Profile for Acetone. Although ATSDR discusses the carcinogenicity data in its Toxicological Profiles, it does not currently assess cancer potency or perform cancer risk assessments.

## Adopted Dose-Response Values

Dose-response values for threshold and non-threshold effects associated with oral or inhalation exposure to benzene have not been published by Australian regulatory bodies.

**Threshold (Non-Carcinogenic)**

For assessment of potential threshold effects associated with oral exposure to acetone, AECOM has adopted the reference dose of **2 mg/kg/day** published by ATSDR (ATSDR, 1994).

For assessment of potential threshold effects associated with inhalation exposure to acetone, AECOM has adopted the inhalation reference concentration of **30.88 mg/m$^3$** published by ATSDR (ATSDR, 1994).

# Antimony – Toxicological Profile

The majority of the following information has been sourced from ATSDR (1992), with other sources listed in the references.

## Chemical Identification

CAS: 7440-36-0

Molecular Formula: Sb

Molecular Weight: 121.76 g/mol

## Significance of Exposure Pathways and Background

The background intake of antimony is considered to be negligible and therefore, a background intake of 0% was adopted.

## Adopted Dose-Response Values

Dose-response values for threshold and non-threshold effects associated with oral or inhalation exposure to antimony have not been published by Australian regulatory bodies.

**Threshold (Non-Carcinogenic)**

For assessment of potential threshold effects associated with oral exposure to antimony, AECOM has adopted the reference dose of **0.006 mg/kg/day** published by RIVM (RIVM, 2008).

As reference concentration data for antimony inhalation have not been published, the RfD (RVIM, 2008) has been converted to an RfC (RfC = (body weight x RfD)/ inhalation rate, where body weight is assumed to be 70 kgs and inhalation rate equal to 20 m3/day) and the RfC of **0.021 mg/m$^3$** accepted.

**Non-Threshold (Carcinogenic)**

To AECOM's knowledge, non-threshold dose-response criteria for oral and inhalation exposure to antimony have not been published by Australian or other regulatory bodies. Potential health effects associated with oral and inhalation exposure to antimony have therefore been assessed on the basis of threshold dose response criteria.

# Arsenic (inorganic)

The majority of the following information has been sourced from NEPC (2013) and ATSDR (2007), with other sources listed in the references.

## Chemical Identification

CAS: 7440-38-2

Molecular Formula: As

Molecular Weight: 74.92 g/mol

## General

Arsenic is a metalloid that can exist in four valence states (-3, 0, +3 and +5) and forms a steel grey, brittle solid in elemental form. Under reducing conditions, arsenite (As III) is the dominant form and, in well oxygenated environments, arsenate (AsV) is the dominant form. It is the 20$^{th}$ most commonly occurring element in the Earth's crust, occurring at an average concentration of 3.4 ppm.

Inorganic arsenic occurs naturally in soil and rocks especially in minerals and ores containing copper or lead. Presently, about 90% of all arsenic produced is used as a preservative (copper chromate arsenate) for wood to protect it from rotting and decay. In the past, inorganic arsenic compounds have been used as pesticides, primarily on cotton fields and in orchards however this is now prohibited.

Naturally occurring arsenic may enter the air, water, and land from wind-blown dust and may get into water from runoff and leaching. Arsenic may enter the environment during the mining and smelting and small amounts may be released into the atmosphere from coal-fired power plants and incinerators.

Arsenic readily dissolves in water and is detected in lakes, rivers, or underground water as well as in rain or snow and industrial waste discharges. Arsenic cannot be destroyed in the environment and ultimately ends up in soil or sediments.

## Significance of Exposure Pathways and Background

Ingestion of soil and dust is considered the most significant pathway of exposure for inorganics in soil (NEPC, 2013). However, the bioavailability and inclusion of other exposure pathways should also be assessed e.g. inhalation of arsenic adsorbed to particulates.

A range of 25-75% bioavailability may be appropriate for the assessment of arsenic in soil (NEPC, 2013). The range of bioavailabilities considered would need to be based on suitable data in relation to source and site-specific bioavailability (where lower bioavailability values were considered appropriate).

NEPC (2013) reviewed the background intakes of arsenic from other sources, as a percentage of the toxicity reference values. Based on this review, a background intake of 50% was determined for oral and dermal pathways while a background intake of 0% was determined for the inhalation pathway.

## Non-Carcinogenic Health Effects

Inorganic arsenic is responsible for most cases of arsenic induced toxicity in humans. Although there may be some differences in the potency of different chemical forms (e.g. arsenites tend to be somewhat more toxic than arsenates), these differences are usually minor. An exception would be arsine, which is highly toxic.

It is generally accepted that the arsenic-carbon bond is quite strong and most mammalian species do not have the capacity to break this bond; thus, inorganic arsenic is not formed during the metabolism of organic arsenicals. Inorganic As(V) is readily reduced to inorganic forms which are taken up by the cell, usually hepatocytes.

Studies have identified effects on virtually every organ or tissue evaluated, although some end points appear to be more sensitive than others. Available data from humans identify the skin as the most sensitive noncancer target following long-term oral arsenic exposure. Typical dermal effects include hyperkeratinization of the skin (especially on the palms and soles), formation of multiple hyperkeratinized corns or warts, and hyperpigmentation of the skin with interspersed spots of hypopigmentation. Oral exposure data from studies in humans indicate that

these lesions typically begin to manifest at exposure levels of about 0.002–0.02 mg As/kg/day. At these exposure levels, peripheral vascular effects are also commonly noted, including cyanosis, gangrene and “Blackfoot Disease.” Other reported cardiovascular effects include increased incidences of high blood pressure and circulatory problems.

Nausea, vomiting, and diarrhea are very common symptoms in humans following oral exposure to inorganic arsenicals, both after acute high-dose exposure and after repeated exposure to lower doses; these effects are likely due to a direct irritation of the gastrointestinal mucosa. Acute, high-dose exposure can lead to encephalopathy, with clinical signs such as confusion, hallucinations, impaired memory, and emotional liability, while long-term exposure to lower levels can lead to the development of peripheral neuropathy characterized by a numbness in the hands and feet that may progress to a painful "pins and needles" sensation. Recent studies also have reported neurobehavioral alterations in arsenic-exposed children.

Chronic exposure in drinking water has been associated with excess incidence of miscarriages, stillbirths, preterm births, and infants with low birth weights. Animal data suggest that arsenic may cause changes to reproductive organs of both sexes, including decreased organ weight and increased inflammation of reproductive tissues, although these changes may be secondary effects. However, these changes do not result in a significant impact on reproductive ability.

A large number of studies in humans have reported cardiovascular effects after acute and long term oral exposure to inorganic arsenic compounds. Studies of workers exposed by inhalation report irritation of the mucous membranes of the nose and throat, which may lead to laryngitis, bronchitis, or rhinitis. Respiratory effects have also been reported following oral exposure to inorganic arsenic and include respiratory distress, hemorrhagic bronchitis, and pulmonary edema; however, it is not clear whether these are primary effects or are the result of damage to the pulmonary vascular system.

A common effect following both oral and inhalation exposure to inorganic arsenic is the development of peripheral neuropathy. Workers exposed at pesticide plants or smelters, have shown increased incidence of neurological changes including sensory and motor polyneuropathy.

## Identification of Non-Carcinogenic Toxicity Reference Values

The dose-response values provide an estimate of exposure to the human population that is likely to be without an appreciable risk of deleterious effects during a lifetime. The oral exposure represents a daily value and the inhalation exposure represents continuous inhalation. These values are intended for use in risk assessments for health effects known or assumed to be produced through a nonlinear (presumed threshold) mode of action (USEPA, 2013). Available chronic dose-response values published by sources recognised and endorsed by enHealth (enHealth, 2012), NEPC (NEPC, 2013) and the USEPA and are summarised below.

**Oral**

The oral dose-response value is expressed in units of mg/kg/day. This value may be termed a Reference Dose (RfD), Tolerable Daily Intake (TDI), or Minimal Risk Level for oral exposure (MRL) depending on the agency of derivation.

**Table 1 Published Threshold Dose-Response Values for Arsenic - Oral**

| Agency | Oral Dose-Response Value (mg/kg/day) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| NEPC | 0.002 | NEPC (2013) | - | - | - | RfD. Based on Australian and International approaches. |
| NHMRC | 0.0003 | NHMRC (2011) | - | - | - | TDI. Calculated from guideline value of 0.01. |
| ATSDR | 0.0003 | ATSDR (2007) | Dermal effects | Human | 3 | Chronic MRL. Based on a number of studies. |
| IRIS | 0.0003 | USEPA (2013) | Dermal effects | Human | 3 | RfD. Based on Tseng, 1977 and Tseng et al., 1968. |

| Agency | Oral Dose-Response Value (mg/kg/day) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| RIVM | 0.001 | Baars AJ et al. (2001) | Dermal effects | Human | 2 | TDI. Health Council of The Netherlands, 1993 |

NEPC – National Environment Protection Council
NHMRC – National Health and Medical Research Council
ATSDR – Agency for Toxic Substances and Disease Registry
IRIS – Integrated Risk Information System
RIVM – National Institute of Public Health and the Environment (Netherlands)
UF – Uncertainty Factor.

**Inhalation**

The inhalation dose-response value is expressed in units of $mg/m^3$. This value may be termed a Reference Concentration (RfC), Toxicity Reference Value (TRV), Tolerable Concentration (TC), or Minimal Risk Level for inhalation (MRL) depending on the agency of derivation.

**Table 2 Published Threshold Dose-Response Values for Arsenic - Inhalation**

| Agency | Inhalation Dose-Response Value ($mg/m^3$) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| NEPC | 0.001 | NEPC (2013) | Lung Cancer | Human | 10 | TRV. Based on RIVM (2001). |
| California EPA | 0.000015 | USEPA (2013) | - | - | - | RfC. |
| RIVM | 0.001 | RIVM (2001) | Lung Cancer | Human | 10 | RfC. Based on Blom et al., 1985 and Lagerkvist et al., 1984. |

## Carcinogenicity and Genotoxicity

The International Agency for Research on Cancer (IARC) has classified arsenic and inorganic arsenic compounds as Group 1 – carcinogenic to humans.

Arsenic is a known human carcinogen based on human epidemiological studies that show skin and internal cancers (in particular, bladder, liver and lung) associated with chronic exposures to arsenic in drinking water. There are limited animal studies is because arsenic has not been shown to cause cancer in rodents due to interspecies differences between rodents and humans.

A recent Australian review of available data (APVMA, 2005) on arsenic carcinogenicity and genotoxicity noted the following:

- The mechanisms behind tumour formation and chromosomal damage do not appear to involve mutagenesis.
- The epidemiological evidence from occupational exposure studies indicates that arsenic acts at a later stage in the development of cancer.

This supports the notion that arsenic appears to behave like a carcinogen which exhibits a threshold effect.

On the basis of the above and other studies identified in NEPC (2013), the use of threshold dose-response for the assessment of carcinogenic effects associated with arsenic exposure is considered appropriate.

## Identification of Carcinogenic Toxicity Reference Values

**Oral**

The oral dose-response value is expressed in units of $(mg/kg/day)^{-1}$. This value may be termed a Cancer Slope Factor (CSF), a Cancer Risk (CR), Slope Factor (SF), Risk Specific Dose (RSD) or Toxic Dose (that corresponds

to a 5% increase in mortality) ($TD_{05}$) depending on the agency of derivation. Some agencies present guideline values which may be converted to dose-response values.

**Table 3 Published Non-Threshold Dose-Response Values for Arsenic – Oral**

| Agency | Oral Cancer Slope Factor $(mg/kg/day)^{-1}$ | Notes | Source |
|---|---|---|---|
| IRIS | 1.5 | Slope factor. USEPA (2013) | Based on Tseng, 1977 and Tseng et al., 1968. |
| Health Canada | 1.5 | Slope factor converted from $TD_{05}$. | Health Canada (1993) |

IRIS – Integrated Risk Information System.

### Inhalation

The inhalation dose-response value is expressed in units of $mg/m^3$. This value may be termed a Unit Risk (UR), Cancer Risk (CR), Risk Specific Concentration (RSC), Toxic Dose (that corresponds to a 5% increase in mortality) ($TD_{05}$) or Tolerable Concentration in Air (TCA) depending on the agency of derivation.

**Table 4 Published Non-Threshold Dose-Response Values for Arsenic - Inhalation**

| Agency | Inhalation Unit Risk Factor $(mg/m^3)^{-1}$ | Notes | Source |
|---|---|---|---|
| WHO | 0.0015 | Unit risk. | WHO (2000) |
| IRIS | 0.0043 | Unit risk. USEPA (2013) | USEPA (2013) |
| Health Canada | 0.0015 | Unit risk converted from $TD_{05}$. | Health Canada (1993) |
| RIVM | 0.001 | TCA. | Based on Blom et al., 1985 and Lagerkvist et al., 1984. |

IRIS – Integrated Risk Information System.
RIVM – National Institute of Public Health and the Environment (Netherlands)
WHO – World Health Organisation

## Adopted Dose-Response Values

### Threshold (Non-Carcinogenic)

For assessment of potential threshold effects associated with oral exposure to inorganic arsenic, AECOM has adopted an oral TRV of 0.002 mg/kg/day (NEPC, 2013).

For assessment of potential threshold effects associated with inhalation exposure to inorganic arsenic, AECOM has adopted the NEPC (2013) inhalation TRV of 0.001 $mg/m^3$.

### Non-Threshold (Carcinogenic)

As noted above, a linear (non-threshold) dose-response is not supported for carcinogenic effects associated with arsenic exposure. The use of a threshold dose-response approach for the assessment of carcinogenic effects associated with arsenic exposure is therefore considered reasonable.

# Benzene

The majority of the following information has been sourced from ATSDR (2007), with other sources listed in the references.

## Chemical Identification

Synonyms: benzene, benzol

CAS: 71-43-2

Molecular Formula: $C_6H_6$

Molecular Weight: 78.11 g/mol

## General

Although benzene occurs naturally and is emitted by volcanoes and forest fires, the greatest sources are associated with the manufacture of plastics, resins, and nylon and other synthetic fibres. Benzene is used to make some types of rubbers, lubricants, dyes, detergents, drugs, and pesticides and is a natural part of crude oil, gasoline, and cigarette smoke.

## Significance of Exposure Pathways and Background

The most significant exposure pathway is inhalation of contaminated air and tobacco smoke from both active and passive smoking. Although benzene has been detected in certain foods, beverages and tap water, these do not constitute major sources of exposure for most people (ATSDR, 2007).

CRC CARE (Friebel, E. and Nadebaum, P., 2011) reviewed the air background levels in Australia for benzene and below is a summary of this review and the assumptions adopted during development of the health screening levels (HSLs):

- an allocation of 20% of the RfC was attributed to background benzene in air which was considered to be protective of the majority of residential properties in Sydney and Melbourne.

The adopted skin absorption factor was set at 8%, as adopted by CRC CARE during derivation of the benzene HSL (Friebel, E. and Nadebaum, P., 2011).

## Non-Carcinogenic Health Effects

Damage to both the humoral and cellular components of the immune system has been known to occur in humans following inhalation exposure. This is manifested by decreased levels of antibodies and decreased levels of leukocytes in workers. Animal data support these findings.

The most characteristic systemic effect resulting from intermediate and chronic benzene exposure is arrested development of blood cells. Early biomarkers of exposure to relatively low levels of benzene include depressed numbers of one or more of the circulating blood cell types. A common clinical finding in benzene hematotoxicity is cytopenia, which is a decrease in various cellular elements of the circulating blood manifested as anemia, leukopenia, or thrombocytopenia in humans and in animals. Benzene associated cytopenias vary and may involve a reduction in one (unicellular cytopenias) to all three (pancytopenia) cellular elements of the blood.

Benzene causes a life-threatening disorder called aplastic anemia in humans and animals. This disorder is characterized by reduction of all cellular elements in the peripheral blood and in bone marrow, leading to fibrosis, an irreversible replacement of bone marrow. Benzene has also been associated with acute non-lymphocytic leukemia in humans, and aplastic anemia may be an early indicator of developing acute non-lymphocytic leukemia in some cases.

Limited information is available on other systemic effects reported in humans and is associated with high–level benzene exposure. Respiratory effects have been noted after acute exposure of humans to benzene vapors. Cardiovascular effects, particularly ventricular fibrillation, have been suggested as the cause of death in fatal exposures to benzene vapor. Gastrointestinal effects have been noted in humans after fatal inhalation exposure (congestive gastritis), and ingestion (toxic gastritis and pyloric stenosis), of benzene.

Myelofibrosis (a form of aplastic anemia) was reported by a gasoline station attendant who had been exposed to benzene by inhalation, and probably also through dermal contact. Myalgia was also reported in steel plant workers exposed to benzene vapors. Reports of renal effects in humans after benzene exposure consist of kidney congestion after fatal inhalation exposure. Dermal and ocular effects including skin irritation and burns, and eye irritation have been reported after exposure to benzene vapors. Swelling and edema have been reported to occur in a human who swallowed benzene. Studies in animals show systemic effects after inhalation exposure, including cardiovascular effects. Oral administration of benzene to animals has yielded information concerning hepatic effects. A study conducted in rabbits lends support to the finding that benzene is irritating and damaging to the skin and also shows that it is irritating and damaging to the eyes following dermal or ocular application.

## Identification of Non-Carcinogenic Toxicity Reference Values

The dose-response values provide an estimate of exposure to the human population that is likely to be without an appreciable risk of deleterious effects during a lifetime. The oral exposure represents a daily value and the inhalation exposure represents continuous inhalation. These values are intended for use in risk assessments for health effects known or assumed to be produced through a nonlinear (presumed threshold) mode of action (USEPA, 2012). Available chronic dose-response values published by sources recognised and endorsed by enHealth (enHealth, 2004), NEPC (NEPC, 1999) and the USEPA and are summarised below.

### Oral

The oral dose-response value is expressed in units of mg/kg/day. This value may be termed a Reference Dose (RfD), Tolerable Daily Intake (TDI), or Minimal Risk Level for oral exposure (MRL) depending on the agency of derivation.

**Table 1 Published Threshold Dose-Response Values for Benzene - Oral**

| Agency | Oral Dose-Response Value (mg/kg/day) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| ATSDR | 0.0005 | ATSDR (2007) | Decreased lymphocyte count | Human | 30 | Chronic MRL. Based on study by Lan et al., 2004 |
| IRIS | 0.004 | USEPA (2003) | Decreased lymphocyte count | Human | 300 | RfD. Based on Study by Rothman et al., 1996 |

ATSDR – Agency for Toxic Substances and Disease Registry

IRIS – Integrated Risk Information System.

UF – Uncertainty Factor.

### Inhalation

The inhalation dose-response value is expressed in units of $mg/m^3$. This value may be termed a Reference Concentration (RfC), Tolerable Concentration (TC), or Minimal Risk Level for inhalation (MRL) depending on the agency of derivation.

**Table 2 Published Threshold Dose-Response Values for Benzene - Inhalation**

| Agency | Inhalation Dose-Response Value ($mg/m^3$) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| ATSDR | 0.0096* | ATSDR (2007) | Decreased lymphocyte count | Human | 10 | Chronic MRL. Based on study by Lan et al., 2004 |
| IRIS | 0.03 | USEPA (2003) | Decreased lymphocyte count | Human | 300 | RfC. Based on Study by Rothman et al., 1996 |

*Converted from 0.003ppm to $mg/m^3$ using the molecular weight of 78.11 and assuming 25ºC and 760 mm Hg

## Carcinogenicity and Genotoxicity

The carcinogenicity of benzene is well documented in exposed workers. Epidemiological studies and case reports provide clear evidence of a causal relationship between occupational exposure to benzene and benzene-containing solvents and the occurrence of acute myelogenous leukemia (AML). The epidemiological studies are generally limited by confounding chemical exposures and methodological problems, including inadequate or lack

of exposure monitoring and low statistical power, but a consistent excess risk of leukemia across studies indicates that benzene is the causal factor. The IARC have classified benzene as a Group 1 agent (carcinogenic).

*In vivo* and *in vitro* data from both humans and animals indicate that benzene and/or its metabolites are genotoxic. Chromosomal aberrations (hypo- and hyperdiploidy, deletions, breaks, and gaps) in peripheral lymphocytes and bone marrow cells are the predominant effects seen in humans.

## Identification of Carcinogenic Toxicity Reference Values

### Oral

The oral dose-response value is expressed in units of $(mg/kg/day)^{-1}$. This value may be termed a Cancer Slope Factor (CSF), a Cancer Risk (CR), Slope Factor (SF), or Risk Specific Dose (RSD) depending on the agency of derivation. Some agencies present guideline values which may be converted to dose-response values.

**Table 3 Published Non-Threshold Dose-Response Values for Benzene – Oral**

| Agency | Oral Cancer Slope Factor $(mg/kg/day)^{-1}$ | Notes | Source |
|---|---|---|---|
| NHMRC | 0.035 | GV. Converted from unit risk of $1 \times 10^{-6}$ per 0.001 mg/L, assuming 2 L/day water ingestion rate and 70 kg body weight | NHMRC (2011) |
| WHO | 0.035 | GV. Converted from unit risk of $1 \times 10^{-5}$ per 0.01 mg/L, assuming 2 L/day water ingestion rate and 70 kg body weight | WHO (2011) |
| RIVM | 0.00033 | CR (provisional). The oral slope factor is derived by route-to-route extrapolation from the inhalation limit value. Converted from risk level of $1 \times 10^{-4}$ to risk level of $1 \times 10^{-5}$ by dividing by 10 | RIVM (2001) |
| IRIS | 0.015 – 0.055 | Range of slope factors provided. | USEPA (2000) |

IRIS – Integrated Risk Information System.
NHMRC – National Health and Medical Research Council
RIVM – National Institute of Public Health and the Environment (Netherlands)
WHO – World Health Organisation

### Inhalation

The inhalation dose-response value is expressed in units of $mg/m^3$. This value may be termed a Unit Risk (UR), Cancer Risk (CR), Risk Specific Concentration (RSC) or Toxic Dose (that corresponds to a 5% increase in mortality) ($TD_{0.05}$) depending on the agency of derivation.

**Table 4 Published Non-Threshold Dose-Response Values for Benzene - Inhalation**

| Agency | Inhalation Unit Risk Factor $(mg/m^3)^{-1}$ | Notes | Source |
|---|---|---|---|
| WHO | $6 \times 10^{-6}$ | Average UR converted to SF. Geometric mean of the range of estimates of the lifetime risk ($4.4\text{-}7.5 \times 10^{-6}$) | WHO (2010) |
| Health Canada | 0.003 | $TC_{0.05}$. Based on study by Rinsky et al., 1987. Converted from based on risk level of $1 \times 10^{-5}$ | Health Canada (1993) |
| RIVM | 0.002 | $CR_{inhal}$. Converted to risk level of $1 \times 10^{-5}$ | RIVM (2001) |
| IRIS | $2.2\times10^{-6}$ – $7.8\times10^{-6}$ | Range of inhalation unit risk values provided. Average value: $5.0\times10^{-6}$ | USEPA (2000) |

IRIS – Integrated Risk Information System.
NHMRC – National Health and Medical Research Council
RIVM – National Institute of Public Health and the Environment (Netherlands)
WHO – World Health Organisation

## Adopted Dose-Response Values

Dose-response values for threshold and non-threshold effects associated with oral or inhalation exposure to benzene have not been published by Australian regulatory bodies.

**Threshold (Non-Carcinogenic)**

For assessment of potential threshold effects associated with oral exposure to benzene, AECOM has adopted the reference dose of **0.004 mg/kg/day** published by IRIS (USEPA, 2003).

For assessment of potential threshold effects associated with inhalation exposure to benzene, AECOM has adopted the inhalation reference concentration of **0.03 mg/m$^3$** published by IRIS (USEPA, 2003).

**Non-Threshold (Carcinogenic)**

For assessment of potential non-threshold effects associated with oral exposure to benzene, AECOM has adopted the Oral Slope Factor of **0.035 (mg/kg/day)$^{-1}$** published by NHMRC (NHMRC, 2011).

For assessment of potential non-threshold effects associated with inhalation exposure to benzene, AECOM has adopted the inhalation unit risk value of **6.0 x 10$^{-6}$ (µg/m$^3$)$^{-1}$** published by WHO (WHO, 2010).

# Cadmium – Toxicological Profile

The following information has been taken from ATSDR (2008):

## General

Cadmium is used in the manufacture of batteries, pigments, coatings/platings and plastics stabilisers and is extracted as a byproduct during the production of other metals such as zinc, lead, or copper and recycling of batteries.

Cadmium exists as the hydrated ion or as ionic complexes with other inorganic or organic substances. Soluble forms migrate in water while insoluble forms of are immobile and will deposit and absorb to sediments. Cadmium which has entered the atmospheric can be transported long distances is eventually deposited onto soil and water surfaces. Cadmium and cadmium compounds readily migrate through soil and can adhere tightly to organic matter where is can be taken up by plant life and eventually enter the food chain.

## Significance of Exposure Pathways and Background

In accordance with the ASC NEPM (2013), background intakes from other sources (as a % of the TRV):

Bio = 60% for oral and dermal intakes

Bli = 20% for inhalation

## Non-carcinogenic Health Effects

Toxicological properties of cadmium are similar for the several different salts and oxides of cadmium that have been investigated, although differences in absorption and distribution lead to different effect levels.

For inhalation exposure, particle size and solubility in biological fluids (in contrast to solubility in water) appear to be the more important determinants of the toxicokinetics. For oral exposure, most experimental studies have used soluble cadmium, which exists as the $Cd^{+2}$ ion regardless of the initial salt. Absorption appears to be similar for cadmium ion and cadmium complexed with proteins in food, except for a few specific types of foods such as Bluff oysters and seal meat. Also, poorly soluble cadmium pigments may be absorbed to a lesser extent than soluble cadmium ion.

There is an extensive database on the toxicity of cadmium in environmentally exposed populations and in cadmium workers; however, most of these studies were focused on the presumed sensitive targets (lung after inhalation exposure and kidney after oral ingestion). Other effects that have been observed in humans and/or animals include reproductive toxicity, hepatic effects, hematological effects, and immunological effects.

The earliest indication of kidney damage in humans is an increased excretion of low molecular weight proteins, particularly β2-microglobulin, human complex forming glycoprotein (pHC) (also referred to as α1-microglobulin), and retinol binding protein; increased urinary levels of intracellular enzymes such as N-acetyl-β-glucosaminidase (NAG); and increased excretion of calcium and metallothione. Numerous studies of cadmium workers and populations living in areas with low, moderate, or high cadmium pollution have found significant associations between urinary cadmium levels and biomarker levels or significant increases in the prevalence of abnormal biomarker levels. At higher exposure levels, decreases in glomerular filtration rate, increased risk of renal failure, and significant increases in the risk of deaths from renal disease have been observed. The sensitivity of the kidney to cadmium is related to its distribution in the body and *de novo* synthesis of metallothionein in the kidney. In the blood, cadmium is bound to metallothionein and is readily filtered at the glomerulus and reabsorbed in the proximal tubule. Within the tubular cells, the metallothionein is degraded in lysosomes and free cadmium is released; the synthesis of endogenous metallothionein by the tubular cells is then stimulated. However, when the total cadmium content in the renal cortex reaches between 50 and 300 µg/g wet weight, the amount of cadmium not bound to metallothionein becomes sufficiently high to cause tubular damage. Free cadmium ions may inactivate metal-dependent enzymes, activate calmodulin, and/or damage cell membranes through activation of oxygen species. Because the toxicity of cadmium is dependent on its concentration in the kidney, adverse effects in humans are typically not observed after shorter durations.

Acute inhalation exposure may cause destruction of lung epithelial cells, resulting in pulmonary edema, tracheobronchitis, and pneumonitis. A single, high-level cadmium exposure can result in long-term impairment of lung function. At the cellular level, catalase, superoxide dismutase, non-protein sulfhydryl, glucose-6-phosphate dehydrogenase, and glutathione peroxidase are decreased in response to cadmium lung insults. The response is cell hyperplasia and after long term inhalation exposure at lower levels decreased lung function has been observed.

Prolonged inhalation or ingestion in humans has led to debilitating bone disease in at risk individuals (poor nutrition, high cadmium exposure). Decreases in bone mineral density, increases in the risk of fractures, and increases in the risk of osteoporosis have also been observed in populations exposed to high levels of cadmium.

Limited developmental human data is available however in animals cadmium exposure by inhalation, oral or parenteral routes has been shown to be toxic to physiological and neurological development.

## Carcinogenicity and Genotoxicity

The International Agency for Research on Cancer (IARC) has classified cadmium as a Group 1 carcinogen (probable human carcinogen) based on its assessment of sufficient evidence of an increase in lung cancer in humans and sufficient evidence of lung cancer in rats.

In-vivo and in-vitro studies suggest cadmium is not genotoxic.

## Published Dose-Response Values

Available chronic dose-response values published by sources recognised and endorsed by NEPC (2013) and enHealth (2012) are summarised in the following table.

**Table 1: Published Dose-Response Values for Cadmium**

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.0008 mg/kg/day | NEPC (2013) | Based on the review of cadmium undertaken by JECFA (WHO, 2010). |
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.0007 mg/kg/day | NHMRC (2011) | Concentration that will ensure that critical renal cortex concentrations will not be reached in a 70 year lifetime |
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.001 mg/kg/day | WHO (2008) | Based on a provisional tolerable weekly intake |
| Oral | Minimal Risk Level (MRL) | Threshold | 0.0001 mg/kg/day | ATSDR (2008) | |
| Oral | Reference Dose (RfD) | Threshold | 0.001 mg/kg/day | USEPA (2013) | Based on chronic exposure |
| Oral | Reference Dose (RfD) | Threshold | 0.0005 mg/kg/day | USEPA (2013) | Lower RfD of cadmium (diet) and cadmium (water) |
| Inhalation | Reference Concentration (RfC) | Threshold | 0.000005 $mg/m^3$ | NEPC (2013) | Based on the WHO (2000) guideline value of 0.005 $\mu g/m^3$. |
| Inhalation | Minimal Risk Level (MRL) | Threshold | 0.00001 $mg/m^3$ | ATSDR (2008) | Chronic duration inhalation MRL |
| Inhalation | Reference Concentration (RfC) | Threshold | 0.00001 $mg/m^3$ | USEPA (2013) | |

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Inhalation | Inhalation Unit Risk (IUR) | Non threshold | 0.0018 $(ug/m3)^{-1}$ | USEPA (2013) | |

## Adopted Threshold Dose-Response Values

For assessment of potential threshold effects associated with oral exposure to cadmium, AECOM has adopted the acceptable daily intake (ADI) of 0.0008 mg/kg/day adopted by the NEPC (2013) for derivation of the health investigation level value.

For assessment of potential threshold effects associated with inhalation exposure to cadmium, AECOM has adopted the Reference Concentration (RfC) of 0.000005 $mg/m^3$ adopted by NEPC (2013).

## Adopted Non-Threshold (Carcinogenic) Dose-Response Values

To AECOM's knowledge, non-threshold dose-response criteria for oral exposure to cadmium have not been published by Australian or other regulatory bodies. Potential health effects associated with oral exposure to cadmium have therefore been assessed on the basis of threshold dose response criteria.

AECOM has not evaluated potential non-threshold inhalation effects of cadmium based on the following:

- WHO (2000) concluded that the available data are not sufficient to derive an inhalation unit risk due to concomitant exposure to arsenic studies; and
- the health-based air guideline published by WHO (2000) (and adopted for assessment of threshold effects via the inhalation pathway) considered lung cancer risk in its derivation.

# Lead

The majority of the following information has been sourced from NEPC (2013), ATSDR (2007) and WHO (2000), with other sources listed in the references.

## General

Lead is a naturally occurring element found in the Earth's crust at an average concentration of approximately 15 to 20 mg/kg. Lead is used principally in the production of batteries, metal alloys, X-ray shielding materials, ammunition, chemical resistant linings and pigments. It has also been used historically as an additive in petrol and also in many paints.

Owing to the decreasing use of lead containing additives in petrol and of lead-containing solder in the food processing industry, concentrations in air and food are declining, and intake from drinking-water constitutes a greater proportion of total intake. Lead is rarely present in tap water as a result of its dissolution from natural sources; rather, its presence is primarily from household plumbing systems containing lead in pipes, solder, fittings or the service connections to homes. The amount of lead dissolved from the plumbing system depends on several factors, including pH, temperature, water hardness and standing time of the water, with soft, acidic water being the most plumbosolvent.

## Significance of Exposure Pathways and Background

The most significant exposure pathway for lead is the ingestion of soil and dust. Although lead has been detected in certain foods, beverages, air and tap water, these do not constitute major sources of exposure for most people.

Consistent with the approach adopted by NEPC (2013), no background adjustment factors have been applied to the Rfd or RfC.

## Non-Carcinogenic Health Effects

Most of the information gathered about lead toxicity comes from studies of workers from a variety of industries and from studies of adults and children in the general population. The most sensitive targets for lead toxicity are the developing nervous system, the hematological and cardiovascular systems, and the kidney. However, leads multi-mode action in biological systems has the potential to affect any system or organ in the body.

Studies of lead workers suggest that long-term exposure to lead may be associated with increased mortality due to cerebrovascular disease. Population studies suggest that there is a significant association between bone-lead levels and elevated blood pressure and blood lead levels also have been associated with small elevations in blood pressure. At low levels lead negatively affects kidney function by reducing glomerular filtration rates. Lead inhibits haem synthesis, shortens erythrocyte lifespan and can induce inappropriate production of the hormone erythropoietin leading to inadequate maturation of red cell progenitors, which can contribute to the anemia.

A recent study in children 8–10 years of age suggested that lead accelerates skeletal maturation, which might be a predisposing factor to the development of osteoporosis in later life. Lead also has been associated with increased occurrence of dental caries in children and periodontal bone loss.

Hormonal changes in thyroid levels and reproductive hormones have been observed, as have decreased levels of circulating vitamin D, required for maintenance of calcium homeostasis.

Altered immune parameters have been described in lead workers with changes in some T-cell subpopulations, response to T-cell mitogens, and reduced chemotaxis of polymorphonuclear leukocytes being observed. Some studies have indicated that increased in lead exposure in children may be associated with increases in serum IgE, a primary mediate for type-1 hypersensitivity involved in allergic diseases such as asthma.

Prolonged exposure to high amounts of lead induces symptoms of encephalopathy; dullness, irritability, poor attention span, epigastric pain, constipation, vomiting, convulsions, coma, and death.

Lead poisoning in children can leave residual cognitive deficits that can be still detected in adulthood such as malaise, forgetfulness, irritability, lethargy, headache, fatigue, impotence, decreased libido, dizziness, weakness, and paresthesia. Studies of older populations reported associations between lead and/or bone lead and poorer

performance in neurobehavioral tests. Lead also has been shown to affect nerve conduction velocity and postural balance in workers.

## Identification of Non-Carcinogenic Toxicity Reference Values

The dose-response values provide an estimate of exposure to the human population that is likely to be without an appreciable risk of deleterious effects during a lifetime. The oral exposure represents a daily value and the inhalation exposure represents continuous inhalation. These values are intended for use in risk assessments for health effects known or assumed to be produced through a nonlinear (presumed threshold) mode of action (USEPA, 2014). Available chronic dose-response values published by sources recognised and endorsed by enHealth (enHealth, 2012) and NEPC (NEPC, 2013) and are summarised below.

### Oral

The oral dose-response value is expressed in units of mg/kg/day. This value may be termed a Reference Dose (RfD), Acceptable Daily Intake (ADI), Tolerable Daily Intake (TDI), or Minimal Risk Level for oral exposure (MRL) depending on the agency of derivation.

**Table 1 Published Threshold Dose-Response Values for Lead - Oral**

| Agency | Oral Dose-Response Value (mg/kg/day) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| NEPC | <10 µg/dL | NEPC (2013) | - | - | - | Target Blood Lead Concentration. |
| NHMRC | 0.0035 | NHMRC (2013) | Lead retention in infants | Human | - | ADI. Based on study by Ziegler et al., 1978 and Ryu et al., 1983. |
| RIVM | 0.025 | RIVM (2001) | Brain and CNS | Human | - | PTWI. Cited in FAO/WHO, 1993 and IPCS, 1995. |

NEPC – National Environment Protection Council
NHMRC – National Health and Medical Research Council
RIVM – National Institute of Public Health and the Environment (Netherlands)
UF – Uncertainty Factor.

### Inhalation

The inhalation dose-response value is expressed in units of mg/m$^3$. This value may be termed a Reference Concentration (RfC), Tolerable Concentration (TC), or Minimal Risk Level for inhalation (MRL) depending on the agency of derivation.

**Table 2 Published Threshold Dose-Response Values for Lead - Inhalation**

| Agency | Inhalation Dose-Response Value (mg/m$^3$) | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|
| WHO | 0.0005 | WHO (2000) | Critical level of Pb in blood | Human | - | RfC. Averaging time: 1 year |

## Carcinogenicity and Genotoxicity

The International Agency for Research on Cancer (IARC) has determined that inorganic lead and lead compounds are probably carcinogenic (class 2B agent) based on sufficient evidence from studies in animals and limited evidence in humans.

Renal tumours have been induced in experimental animals exposed to high concentrations of lead compounds in the diet, and IARC has classified lead and inorganic lead compounds in Group 2B (possible human carcinogen). However, there is evidence from studies in humans that adverse neurotoxic effects other than cancer may occur at very low concentrations of lead and that a guideline value derived on this basis would also be protective for carcinogenic effects.

Lead is a clastogenic agent, as shown by the induction of chromosomal aberrations, micronuclei, and sister chromatid exchanges in peripheral blood cells from lead workers. *In vitro* mutagenicity studies in microorganisms have yielded mostly negative results for lead. Tests using mammalian cells have been inconclusive, with some studies reporting negative results and some reporting chromosome damage.

## Identification of Carcinogenic Toxicity Reference Values

To AECOM's knowledge, non-threshold dose-response criteria for oral and inhalation exposure to lead have not been published by Australian or other regulatory bodies. Potential health effects associated with oral and inhalation exposure to lead have therefore been assessed on the basis of threshold dose response criteria.

## Adopted Dose-Response Values

**Threshold (Non-Carcinogenic)**

Based on the approach adopted within the National Environment Protection (Assessment of Site Contamination) Measure 1999 as amended in April 2013 (NEPC, 2013) a target blood lead concentration of <10 µg/dL was adopted for assessment of blood lead exposures via all pathways

# Mercury – Toxicological Profile

The following information has been taken from ATSDR (1999):

## General

Mercury occurs naturally in the environment and exists in several forms; metallic mercury, inorganic mercury and organic mercury. Metallic mercury is a shiny, silver white metal liquid at room temperature and is familiar as the liquid in metal thermometers. At room temperature metallic mercury will evaporate and form mercury vapours which are colorless and odorless Metallic mercury is often found at hazardous waste sites.

Inorganic mercury occurs when mercury combines with elements such as chlorine, sulfur or oxygen. These compounds are called mercury salts and are white powders or crystals, except for mercuric sulfide which is red. Some inorganic mercury compounds are used as fungicides, skin lightening creams, antiseptic and disinfecting agents, tattoo dyes and color paints.

When mercury combines with carbon, organic mercury compounds are formed. There are a large number of organic mercury compounds in the environment but methyl mercury is the most common. In the past, methyl-mercury and dimethyl-mercury have been used for commercial purposes. In the environment, methyl mercury is produced primarily by microorganisms rather than by human activity.

Several forms of mercury occur naturally in the environment; metallic mercury, mercuric sulfide, mercuric chloride and methyl mercury. Some micro-organisms can change the mercury in the environment from one form to another. The most common organic mercy compound that microorganisms and natural processes generate from other forms is methyl mercury. Methyl mercury is of particular concern because it can accumulate in freshwater and salt water marine mammals.

Mercury enters the environment as a result of normal breakdown of minerals and rocks from exposure to wind, water and volcanic activity. The levels of mercury in the atmosphere are very very low and do not pose a health risk. The amounts of mercury present in any one place are usually low however at hazardous waste sites levels 200,000 times the natural background levels can be present.

Mercury enters the air as a result of mining deposits, emissions from coal fired power plants or burning municipal and medical waste. Mercury vapour can be carried long distances, can be changed into other forms of mercury and transported to water or soil in rain or snow. Microorganisms convert inorganic mercury to methyl mercury which can enter the water or soil. Mercury usually stays on the surface of sediments or soil and does not move through the soil to underground water. If mercury enters the water in any form, it is likely to settle to the bottom where it can remain for a long time.

Mercury, in the form of methyl mercury, can accumulate in the food chain in particular in larger older fish such as sharks and swordfish. Plants such as corn, wheat and peas have very low levels of mercury, even if grown in soil containing significant levels of mercury. Mushrooms on the other hand have the capacity to accumulate mercury.

## Significance of Exposure Pathways and Background

In accordance with the ASC NEPM (2013), background intakes from other sources (as a % of the TRV):

Bio = 40% for oral and dermal intakes

Bli = 10% for inhalation

## Non-carcinogenic Health Effects

The nervous system is very sensitive to mercury with incidents of poisoning from ingestions of contaminated fish or seeds leading to brain and kidney damage. Metallic mercury vapours or organic mercury may affect different areas of the brain. Symptoms of damage include personality changes (irritability, shyness, and nervousness), tremors, changes in vision, deafness, muscle un-coordination, loss of sensation and memory difficulties. The varying effects on the nervous system are attributed to the way the different forms of mercury move through the body. When metallic mercury vapours are inhaled they easily enter the bloodstream and are carried through the body to the brain. Breathing or swallowing large amounts of methyl mercury results in some of the mercury

moving into the brain and affecting the nervous system. Inorganic mercury salts, such as mercuric chloride, do not enter the brain as readily ad methyl mercury or metallic mercury vapour.

The kidneys are sensitive to the effects of mercury because it accumulates in the kidneys and causes higher exposures to these tissues. All forms of mercury can cause kidney damage if large enough amounts enter the body however if the damage is not too great, the kidneys are likely to recover once the body clears itself of the contamination.

Short term exposure (hours) to high levels of metallic mercury vapour in the air can damage the lining of the mouth and irritate the lungs and airways causing tightness of breath, a burning sensation in the lungs, and coughing. Other effects from exposure to mercury vapour include nausea, vomiting, diarrhea, increases in blood pressure or heart rate, skin rashes and eye irritation. Damage to the lining of the mouth and lungs can also occur from exposure to lower levels of mercury vapour over longer periods

Most studies of humans who breathed metallic mercury for a long time indicate that mercury from this type of exposure does not affect the ability to have children. Dermal contact with metallic mercury has been shown to cause an allergic skin reaction in some people.

In addition to kidney effected, inorganic mercury damages the stomach and intestines producing symptoms of nausea, diarrhea or severe ulcers if swallowed in large amounts. Cardiac effects have been observed in children who have accidentally swallowed mercuric chloride. Symptoms include rapid heart rate and increased blood pressure.

## Carcinogenicity and Genotoxicity

Studies in workers exposed to metallic mercury vapours has not shown any mercury related increase in cancer while animal studies investigating the effects of long term mercury ingestion were not conclusive with regard to mercury's carcinogenicity. The International Agency for Research on Cancer (IARC) have not classified mercury as to its human carcinogenicity (Group 3 agent).

In-vivo and in-vitro studies indicate mercury has genotoxic properties.

## Published Dose-Response Values

Available chronic dose-response values published by sources recognised and endorsed by NEPC (2013) and enHealth (2012a) are summarised in the following table.

**Table 1: Published Dose-Response Values for Mercury**

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Oral | ADI | Threshold | 0.00047 mg/kg/day | NHMRC (2015) | Based on WHO 1988 maximum tolerable daily intake at which no adverse effects will occur (elemental mercury). |
| Oral | Minimum Risk Level (MRL) | Threshold | 0.0002 mg/kg/day | ATSDR (2010) | Intermediate duration MRL derived for inorganic mercury divided by safety factor to convert to chronic MRL (elemental mercury). |
| Oral | Reference Dose (RfD) | Threshold | 0.00016 mg/kg/day | USEPA (IRIS) | RfD adopted from CalEPA (elemental mercury). |
| Inhalation | Reference Concentration (RfC) | Threshold | 0.001 $mg/m^3$ | WHO (2000a) | Annual average guideline for inorganic mercury vapour in air (elemental mercury). |

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Inhalation | Reference Concentration (RfC) | Threshold | 0.001 mg/m$^3$ | WHO (2000b) | Guideline value (TC) for mercury (inorganic). Averaging time 1 year (elemental mercury). |
| Inhalation | Reference Concentration (RfC) | Threshold | 0.0002 mg/m$^3$ | WHO (2003) | TRV. |
| Inhalation | Minimum Risk Level (MRL) | Threshold | 0.0002 mg/m$^3$ | ATSDR (2009) | Chronic duration inhalation exposure to metallic mercury vapour (elemental mercury). |
| Inhalation | Reference Concentration (RfC) | Threshold | 0.0003 mg/m$^3$ | USEPA (IRIS) | (elemental mercury) |
| Oral | ADI | Threshold | 0.00047 mg/kg/day | NHMRC (2004) | Based on WHO 1988 maximum tolerable daily intake at which no adverse effects will occur (elemental mercury). |
| Oral | Minimum Risk Level (MRL) | Threshold | 0.0002 mg/kg/day | ATSDR (2010) | Intermediate duration MRL derived for inorganic mercury divided by safety factor to convert to chronic MRL (elemental mercury). |
| Oral | Reference Dose (RfD) | Threshold | 0.00016 mg/kg/day | USEPA (IRIS) | RfD adopted from CalEPA (elemental mercury). |

## Adopted Threshold Dose-Response Values

The WHO (2011) value of 0.0006 mg/kg/day has been adopted as the reference dose (RfD) for oral intake of mercury. The WHO (2003) reference concentration (RfC) of 0.0002 mg/m$^3$ has been adopted as the threshold value for inhalation.

## Adopted Non-Threshold (Carcinogenic) Dose-Response Values

To AECOM's knowledge, non-threshold dose-response criteria for oral and inhalation exposure to mercury have not been published by Australian or other regulatory bodies. Potential health effects associated with oral and inhalation exposure to mercury have therefore been assessed on the basis of threshold dose response criteria.

# Nickel – Toxicological Profile

The following information has been taken from ATSDR (2005):

## General

Nickel is found naturally in the environment and can also be released into the environment from industrial furnaces, power plants or rubbish incinerators.

In the environment, it is primarily found combined with oxygen or sulfur as oxides or sulfides. Nickel is released into the atmosphere during nickel mining and by industries that make or use nickel, nickel alloys, or nickel compounds. These industries also might discharge nickel in waste water. Nickel is also released into the atmosphere by oil-burning power plants, coal-burning power plants, and trash incinerators.

Food is the major source of exposure to nickel. You may also be exposed to nickel by breathing air, drinking water, or smoking tobacco containing nickel. Skin contact with soil, bath or shower water, or metals containing nickel, as well as, metals plated with nickel can also result in exposure. Stainless steel and coins contain nickel. Some jewelry is plated with nickel or made from nickel alloys. Patients may be exposed to nickel in artificial body parts made from nickel-containing alloys and it can be transferred from mother to infant during breastfeeding.

The concentration of nickel in air, rivers and lakes is generally very low and is barely detectable however you may be exposed to higher-than-average levels of nickel if you live near industries that process or use nickel.

## Significance of Exposure Pathways and Background

In accordance with the ASC NEPM (2013), background intakes from other sources (as a % of the TRV):

Bio = 60% for oral and dermal intakes

Bli = 20% of inhalation

## Non-carcinogenic Health Effects

The general population can be exposed to nickel via inhalation, oral, and dermal routes of exposure. Based on occupational exposure studies, reports of allergic contact dermatitis, and animal exposure studies, the primary targets of toxicity appear to be the respiratory tract following inhalation exposure, the immune system following inhalation, oral, or dermal exposure, and possibly the reproductive system and the developing organism following oral exposure.

Contact dermatitis is the result of an allergic reaction to nickel that has been reported in the general population and workers exposed via dermal contact with airborne nickel, liquid nickel solution, or prolonged contact with metal items such as jewelry and prosthetic devices that contain nickel. Once an individual becomes sensitized to nickel, dermal contact with only a small amount of nickel can result in dermatitis. Approximately 10–20% of the general population is sensitized to nickel.

Both noncancerous and cancerous respiratory effects have been observed in humans and animals exposed to airborne nickel compounds. Chronic bronchitis, emphysema, pulmonary fibrosis, and impaired lung function have been observed in nickel welders and foundry workers. These effects were not consistently seen across studies, and co-exposure to other toxic metals such as uranium, iron, lead, and chromium confounds the interpretation of the results. Studies examining the risk of death from nonmalignant respiratory disease among nickel workers have not found significant increases; however, many studies found that the number of observed deaths was significantly lower than expected, suggesting a healthy worker effect.

Adverse respiratory effects have been reported in humans and animals exposed to nickel compounds at concentrations much higher than typically found in the environment. The available data on noncancerous respiratory effects in humans are limited. In nickel workers, exposure to nickel did not result in increases in the risk of death from nonmalignant respiratory system disease. Studies examining potential nonlethal respiratory effects have not found consistent results. Animal data provide strong evidence that nickel is a respiratory toxicant; lung inflammation is the predominant effect. Evidence of lung inflammation has been observed following acute-, intermediate-, and chronic-duration exposure of rats to nickel sulfate, nickel subsulfide, or nickel oxide. Human

and animal data provide strong evidence that inhalation exposure to some nickel compounds can induce lung cancer.

The potential for nickel compounds to induce reproductive effects has not been firmly established in either humans or animals. A significant increase in human leukocyte antigen (HLA)-DRw6 antigens were found among individuals with nickel contact dermatitis compared to individuals with no history of atopy or contact dermatitis. Nickel sensitization typically involves initial prolonged contact with nickel or exposure to a very large nickel dose. In the general population, the initial nickel contact often comes from body piercing with jewelry that releases large amount of nickel ions. The resulting dermatitis, which is an inflammatory reaction mediated by type IV hypersensitivity, typically occurs beneath the metal object.

## Carcinogenicity and Genotoxicity

The carcinogenicity of nickel via the inhalation pathway has been well documented in occupationally-exposed individuals. Significant increases in the risk of mortality from lung or nasal cancers were observed in several cohorts of nickel refinery workers. Studies of workers in other nickel industries, including nickel mining and smelting, nickel alloy production, stainless steel production, or stainless steel welding, which typically involve exposure to lower concentrations of nickel, have not found significant increases in cancer risks.

No studies were located regarding cancer in humans after oral exposure to nickel, and nickel acetate was found to be noncarcinogenic in lifetime drinking water studies in rats and mice.

The Department of Health and Human Services has determined that metallic nickel may reasonably be anticipated to be a human carcinogen and nickel compounds are known to be human carcinogens. IARC classified metallic nickel in group 2B (possibly carcinogenic to humans) and nickel compounds in group 1 (carcinogenic to humans). USEPA has classified nickel refinery dust and nickel sulfide in Group A (human carcinogen). Other nickel compounds have not been classified by the EPA. These classifications are based on evidence of carcinogenicity via the inhalation, rather than oral, pathway.

Both *in vitro* and *in vivo* studies in mammals indicate that nickel is genotoxic

## Published Dose-Response Values

Available chronic dose-response values published by sources recognised and endorsed by NEPC (2013) and enHealth (2012) are summarised in the following table.

**Table 1: Published Dose-Response Values for Nickel**

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Oral | Tolerable Daily Intake (TDI) | Threshold | 0.012 mg/kg/day | NEPC (2013) | Based on WHO (2011) toxicity reference value. |
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.005 mg/kg/day | NHMRC (2011) | Safety factor does not include that for carcinogenicity as effects have only been observed upon inhalation |
| Oral | Tolerable Daily Intake (TDI) | Threshold | 0.012 mg/kg/day | WHO (2011) | |
| Oral | Reference Dose (RfD) | Threshold | 0.02 mg/kg/day | USEPA (2010) | |
| Inhalation | Toxicity Reference Value (TRV) | Threshold | 0.00002 | NEPC (2013) | Based on the TRV published by EA (2009) |
| Inhalation | Minimal Risk Level (MRL) | Threshold | 0.00009 $mg/m^3$ | ATSDR (2005) | Chronic duration |
| Inhalation | Unit Risk | Non - threshold | 0.0004 $(ug/m^3)^{-1}$ | WHO (2000a) | |

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Inhalation | Unit Risk | Non - threshold | 0.00038 $(ug/m^3)^{-1}$ | WHO (2000b) | |

## Adopted Threshold Dose-Response Values

For assessment of potential threshold effects associated with oral exposure to nickel, AECOM has adopted the TDI of 0.012 mg/kg/day used by NEPC (2013) for derivation of the health investigation level.

For assessment of potential threshold effects associated with inhalation exposure to nickel, AECOM has adopted the TRV of 0.00002 $mg/m^3$ used by NEPC (2013) for derivation of the health investigation level.

## Adopted Non-Threshold (Carcinogenic) Dose-Response Values

Non-threshold dose-response criteria for oral exposure to nickel have not been published, and nickel is not considered to be carcinogenic via the oral exposure route.

Nickel is not considered to be carcinogenic via the inhalation exposure route, therefore no inhalation reference concentration has been adopted.

# Polycyclic Aromatic Hydrocarbons (PAHs)

## General

Polycyclic aromatic hydrocarbons (PAHs) occur ubiquitously in the environment from both synthetic and natural sources. PAHs occur in the atmosphere most commonly in the products of incomplete combustion. These products include fossil fuels; cigarette smoke; industrial processes (such as coke production and refinement of crude oil); and exhaust emissions from gasoline engines, oil-fired heating, and burnt coals. PAHs are present in groundwater, surface water, drinking water, waste water, and sludge. They are found in foods, particularly charbroiled, broiled, or pickled food items, and refined fats and oils. Individuals living in the vicinity of hazardous waste sites where PAHs have been detected at levels above background may experience exposure to these chemicals via inhalation of contaminated air or ingestion of contaminated food, soil, or water.

Within Australia, the following 16 PAHs are typically analysed for and considered as a group in contaminated site assessment work:

- acenaphthene
- acenaphthylene
- anthracene
- benz[a]anthracene
- benzo[a]pyrene
- benzo[b]fluoranthene
- benzo[g,h,i]perylene
- benzo[k]fluoranthene
- chrysene
- dibenz[a,h]anthracene
- fluoranthene
- fluorene
- naphthalene
- indeno[1,2,3-c,d]pyrene
- phenanthrene
- pyrene

These PAHs are the most commonly assessed based on the following considerations:

- More information is available on them than other PAHs.
- They are suspected to be more harmful than other PAHs, and they exhibit harmful effects that are representative of the PAHs.
- There is considered to be a greater chance of exposure to these PAHs than to the others.

The above PAHs with the exception of naphthalene are considered in this toxicity profile. The toxicity of naphthalene (if considered in this risk assessment) is discussed separately.

## Significance of Exposure Pathways and Background

The most significant exposure pathways are inhalation of contaminated air and ingestion of certain foods, beverages and tap water (ATSDR, 1995).

Background levels of some representative PAHs in the air are reported to be 0.02-1.2 nanograms per cubic meter ($ng/m^3$) in rural areas and 0.15-19.3 $ng/m^3$ in urban areas (ATSDR, 1995).

As summarised in **Table 1** below, estimated chemical intakes from background exposure to PAHs in soil, drinking water, food and air are less than 1% of the lowest TDI adopted in this assessment. Background exposure was therefore not considered to be significant in comparison to the adopted dose-response criteria and TDIs were not corrected for background exposure.

**Table 1 Estimated Background Exposure to PAHs**

| Concentration of Intake | Estimated Intake (mg/kg/day) | Notes |
|---|---|---|
| **Drinking Water** | | |
| 623 ng/L | $1.78 \times 10^{-5}$ | Water concentration is the maximum reported individual PAH concentration for a range of drinking water sources monitored in the USA, United Kingdom and Europe (ATSDR, 1995). Use of this value is considered conservative given that PAHs have not been reported in Australian drinking water supplies (NHMRC, 2011).<br>Intake has been estimated for a 70 kg adult, assuming that 2 L of water per day is ingested. |
| **Food** | | |
| 10 µg/day | $1.4 \times 10^{-4}$ | Food intake is the maximum reported for individual PAHs based on a range of studies in the USA, United Kingdom and Europe (ATSDR, 1995).<br>Intake has been calculated assuming a 70 kg body weight. |
| **Air** | | |
| 10.9 ng/m$^3$ | $3.1 \times 10^{-5}$ | Air concentration is maximum annual average of any individual PAH reported in Australian cities by Environmental Australia (DEH, 1999).<br>Intake has been calculated assuming a 70 kg adult respires 20 m$^3$ of air per day. |
| | | |
| **Total Intake** | | 0.00019 mg/kg/day |
| **Minimum TDI**[1] | | 0.02 mg/kg/day |
| **Fraction of TDI Due to Background Exposure** | | 0.0096 (<1%) |

Notes
[1]Value is minimum TDI of those adopted for PAHs assessed on the basis of threshold dose-response criteria. TDIs ranged from 0.02 mg/kg/day (naphthalene) to 0.3 mg/kg/day (anthracene).

It is noted that the PAH background exposure analysis presented in this report has not explicitly considered background exposure to PAH by smokers. However, ATSDR (1995) report that concentrations of individual PAHs in cigarette smoke range from less than 1 µg per 100 cigarettes to 62 µg per 100 cigarettes. For a 70 kg individual who smokes one pack (20 cigarettes) per day, the maximum expected intake of any individual PAH is therefore estimated to be 0.00018 mg/kg/day. This additional intake due to smoking also represents less than 1% of the lowest PAH TDI considered in this assessment (0.02 mg/kg/day for naphthalene).

Background exposure is not considered in the assessment of carcinogenic (non-threshold) risks, as non-threshold risks are estimated *incremental* lifetime cancer risks. However, it should be noted that the maximum background intake estimated for individual PAHs, if assumed to apply to benzo(a)pyrene or benzo(a)pyrene toxic equivalents, would result in an estimated incremental lifetime cancer risk of approximately 9 in 100,000, which is greater than the acceptable incremental cancer risk of 1 in 100,000 adopted for this assessment . However, this cancer risk estimate should not be interpreted as an indication that exposure to background levels of PAH may cause a significant increase in cancer rates above baseline levels as the baseline lifetime risk of cancer is reported to be approximately 50% (one in two; NRC, 2006). Thus the adopted acceptable incremental cancer risk of 1 in 100,000 and the estimated cancer risk due to background concentrations of PAHs in the environment are still very low in comparison to baseline lifetime cancer risks for the population as a whole.

## Non-Carcinogenic Health Effects

Noncancer adverse health effects associated with PAH exposure have been observed in animals but generally not in humans (with the exception of adverse hematological and dermal effects). Animal studies demonstrate that PAHs tend to affect proliferating tissues such as bone marrow, lymphoid organs, gonads, and intestinal epithelium.

## Identification of Non-Carcinogenic Toxicity Reference Values

The dose-response values provide an estimate of exposure to the human population that is likely to be without an appreciable risk of deleterious effects during a lifetime. The oral exposure represents a daily value and the inhalation exposure represents continuous inhalation. These values are intended for use in risk assessments for health effects known or assumed to be produced through a nonlinear (presumed threshold) mode of action (USEPA, 2012). Available chronic dose-response values published by sources recognised and endorsed by enHealth (enHealth, 2012), NEPC (NEPC, 1999) and the USEPA and are summarised below.

**Oral**

The oral dose-response value is expressed in units of mg/kg/day. This value may be termed a Reference Dose (RfD), Tolerable Daily Intake (TDI), or Minimal Risk Level for oral exposure (MRL) depending on the agency of derivation.

**Table 1 Published Threshold Dose-Response Values for PAHs - Oral**

| PAH | Agency | Oral Dose-Response Value (mg/kg/day) | Source | Target Endpoint | Test Animal | UF | Notes |

UF – Uncertainty Factor.

**Inhalation**

US EPA and other agencies have not published dose-response values for assessment of threshold health effects associated with inhalation exposure to PAHs. Cancer health effects of PAHs were considered to be the primary risk driver via the inhalation pathway, and will be assessed assuming carcinogenic health effects (see below).

## Carcinogenicity and Genotoxicity

**Carcinogenicity**

Evidence exists to indicate that mixtures of PAHs are carcinogenic in humans. The evidence in humans comes primarily from occupational studies of workers exposed to mixtures containing PAHs as a result of their involvement in such processes as coke production, roofing, oil refining, or coal gasification (e.g., coal tar, roofing tar, soot, coke oven emissions, soot, crude oil) (Hammond et al. 1976; Lloyd 1971; Maclure and MacMahon 1980; Mazumdar et al. 1975; Redmond et al. 1976; Wynder and Hoffmann 1967). PAHs, however, have not been clearly identified as the causative agent. Cancer associated with exposure to PAH-containing mixtures in humans occurs predominantly in the lung and skin following inhalation and dermal exposure, respectively. Some ingestion of PAHs is likely because of swallowing of particles containing PAHs subsequent to mucocilliary clearance of these particulates from the lung.

Certain PAHs are carcinogenic to animals by the oral route (e.g., benz[a]anthracene, benzo[a]pyrene, and dibenz[a,h]anthracene). The results of dermal studies indicate that benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[j]fluoranthene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, and indeno[l,2,3-c,d]pyrene are tumorigenic in mice following dermal exposure. The sensitivity of mouse skin to PAH tumorigenesis forms the basis for the extensive studies performed using dermal administration. This tumorigenicity can be enhanced or modified with concomitant exposure to more than one PAH, long straight-chain hydrocarbons (i.e., dodecane), or similar organic compounds commonly found at hazardous waste sites. Thus, humans exposed to PAHs in combination with these substances could be at risk for developing skin cancer.

For many of the carcinogenic PAHs, it appears that the site of tumor induction is influenced by the route of administration and site of absorption, i.e., forestomach tumors are observed following ingestion, lung tumors following inhalation, and skin tumors following dermal exposure. However, the observations that (1) mammary tumors are induced following intravenous injection in Sprague-Dawley rats, (2) the susceptibility to tumor development on the skin after dermal application is not similar in rats and mice, and (3) oral cavity tumors are not

observed when benzo[a]pyrene is administered in the diet, suggest that the point of first contact may not always be the site of PAH-induced tumors.

**Genotoxicity**

Benzo[a]pyrene has been thoroughly studied in genetic toxicology test systems, and has been found to induce genetic damage in prokaryotes, eukaryotes, and mammalian cells in vitro, and to produce a wide range of genotoxic effects (gene mutations in somatic cells, chromosome damage in germinal and somatic cells, DNA adduct formation, UDS, sister chromatid exchange, and neoplastic cell transformation). In cultured human cells, benzo[a]pyrene binds to DNA and causes gene mutations, chromosome aberrations, sister chromatid exchange, and UDS.

The results of in vivo studies indicate that many of the same types of adverse effects observed in vitro were seen in mice, rats, and hamsters exposed to benzo[a]pyrene via the oral, dermal, or intraperitoneal routes. The available data also indicate that benzo[a]pyrene is genotoxic in both somatic and germinal cells of intact animals. The only study that was found regarding genotoxic effects in humans following exposure to benzo[a]pyrene reported no correlation between aluminium plant workers' exposure to PAHs, including benzo[a]pyrene, and sister chromatid exchange frequency. The findings from assays using human cells as the target, in conjunction with the data from whole animal experiments, suggest that benzo[a]pyrene would probably have similar deleterious effects on human genetic material.

Because the genotoxic activity of benzo[a]pyrene is well established, it is frequently used as a positive control to demonstrate the sensitivity of various test systems to detect the genotoxic action of unknown compounds. It also serves as the model compound for PAHs, and the available information on the formation of metabolites and structure of benzo[a]pyrene can theoretically be used to predict potential genotoxicity/carcinogenicity of other PAHs that have not been as extensively studied.

Epoxidation is thought to be the major pathway for benzo[a]pyrene metabolism pertinent to macromolecular interaction. The metabolic attack consists of the cytochrome P-450/P-448-dependent MFO system converting the benzo[a]pyrene molecule into an epoxide; the epoxide is acted upon by epoxide hydrolase to form a dihydrodiol, and a second cytochrome MFO reaction gives rise to the ultimate mutagenic/carcinogenic form, benzo[a]pyrene 7,8-diol-9,10-epoxide. One of the unique structural features of the diol epoxide is that it appears to form in the area of the PAH molecule referred to as the bay region (i.e., a deep-pocketed area formed when a single benzo ring is joined to the remainder of the multiple ring system to form a phenanthrene nucleus).

Analysis of the bay region diol epoxides and their contribution to the DNA binding, genotoxicity, and carcinogenicity of various PAHs has provided the basis for the bay region hypothesis. For example, DNA adducts formed with non-bay region diol epoxides of benzo[a]pyrene have low mutagenic potential. The hypothesis further predicts that structures with more reactive bay regions would probably be more genotoxic and more carcinogenic. The body of evidence on the mutagenic and tumorigenic activity of the PAHs that form bay region diol epoxides (benzo[a]pyrene, benz[a]anthracene, chrysene, dibenz[a,h]anthracene; benzo[b]fluoranthene, benzo[j]fluoranthene, benzo[k]fluoranthene, and indeno[ 1,2,3-c,d]pyrene) supports this hypothesis.

In summary, several general conclusions can be reached for the unsubstituted PAHs evaluated in this profile. The formation of diol epoxides that covalently bind to DNA appears to be the primary mechanism of action for both genotoxicity and carcinogenicity of several of the unsubstituted PAHs that are genotoxins (benzo[a]pyrene, benz[a]anthracene, dibenz[a,h]anthracene, chrysene, benzo[b]fluoranthene, benzo[j]fluoranthene). There was insufficient evidence to draw meaningful conclusions regarding the genotoxic potential of benzo[g,h,i]perylene, although some evidence does exist.

With regard to the unsubstituted PAHs that either lack a bay region configuration (acenaphthene, acenaphthylene, anthracene, fluorene, and pyrene) or appear to have a weakly reactive bay region (phenanthrene), there is no compelling evidence to suggest that they interact with or damage DNA.

The five PAHs that appear to be exceptions to the bay region diol epoxide hypothesis are fluoranthene, benzo[k]fluoranthene, benzo[j]fluoranthene, and indeno[1,2,3-cd]pyrene (no bay region), and benzo[e]pyrene (two bay regions). The evidence does suggest, however, that fluoranthene possesses genotoxic properties while benzo[e]pyrene is either weakly mutagenic or nonmutagenic.

## Identification of Carcinogenic Toxicity Reference Values

**Oral**

The oral dose-response value is expressed in units of $(mg/kg/day)^{-1}$. This value may be termed a Cancer Slope Factor (CSF), a Cancer Risk (CR), Slope Factor (SF), or Risk Specific Dose (RSD) depending on the agency of derivation. Some agencies present guideline values which may be converted to dose-response values. Breath

**Table 2 Published Non-Threshold Dose-Response Values for Benzo(a)pyrene – Oral**

| Agency | Oral Cancer Slope Factor $(mg/kg/day)^{-1}$ | Source | Target Endpoint | Test Animal | Notes |
|---|---|---|---|---|---|
| NHMRC | 0.43 | NHMRC, 2011 | Weight change | Mouse | Derived from drinking water unit risk of $1x10^{-6}$ per 0.00007 mg/L, assuming 70 kg body weight and 2 L/day water ingestion rate. |
| WHO | 0.5 | WHO, 2008 | Oral carcinogenicity | Mouse | Derived from drinking water unit risk of 1 x 10-5 per 0.0007 mg/L. |
| IRIS | 7.3 | USEPA (last reviewed in 1994) | Forestomach, squamous cell papillomas and carcinomas | Mouse and rat | RSD. Neal and Rigdon, 1967; Rabstein et al., 1973; Brune et al., 1981. |
| CCME | 2.3 | CCME (2008) | Forestomach, squamous cell papillomas and carcinomas | Mouse and rat | RSD. Neal and Rigdon, 1967; Rabstein et al., 1973; Brune et al., 1981. |
| RIVM | 0.2 | RIVM, 2001 | Tumor development | rat | Kroese et al., 1999 and Kalberlah et al., 1995 |

IRIS – Integrated Risk Information System.
RIVM – National Institute of Public Health and the Environment (Netherlands)

In order to assess potential oral health effects associated with exposure to potentially carcinogenic PAHs other than benzo(a)pyrene, toxic equivalency factors (TEFs) have been adopted. It is noted that enHealth (2012) state "*At this time, no one set of PAH TEFs has been recommended for use in Australia, although it is likely that the Canadian set* [CCME, 2010] *is becoming more widely used, based on the fact that it is the most recent compilation of such values*" (p149). The TEFs presented below were adopted from the relative potency scheme recommended by the WHO (1998) based on a detailed critical review by CCME of more than a dozen sets of TEF numbers published over the last twenty years (CCME, 2010). These TEFs represent one of the most recent reviews of relative PAH potency undertaken by an international regulatory agency. It was noted by CCME (2010) that more than a dozen sets of equivalency numbers have been proposed over the past two decades and cautions that there can only be limited confidence in the derived potency estimates (enHealth, 2012).

TEFs were adopted, where available, for carcinogenic PAHs considered to be genotoxic carcinogens (benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene; see genotoxicity discussion above). The adopted TEFs are shown in **Table 3** below.

**Table 3 Toxic Equivalency Factors Used to Derive Oral Dose-Response Criteria for Carcinogenic PAHs Relative to Benzo(a)pyrene (CCME, 2010)**

| PAH | Toxic Equivalency Factor (TEF) |
|---|---|
| Benzo(a)pyrene (index compound) | 1.0 |
| Benz(a)anthracene | 0.1 |
| Benzo(b)fluoranthene | 0.1 |
| Benzo(g,h,i)perylene | 0.01 |
| Benzo(k)fluoranthene | 0.1 |
| Chrysene | 0.01 |
| Dibenzo(a,h)anthracene | 1 |
| Indeno(1,2,3-c,d)pyrene | 0.1 |

**Inhalation**

The inhalation dose-response value is expressed in units of mg/m$^3$. This value may be termed a Unit Risk (UR), Cancer Risk (CR), Risk Specific Concentration (RSC), Toxic Dose (that corresponds to a 5% increase in mortality) ($TD_{0.05}$) or Tumourigenic Concentration 5% (TC05) depending on the agency of derivation.

The WHO (2000) inhalation unit risk (IUR) is based on observations in coke oven workers to mixtures of PAHs. It is noted that the composition of PAHs to which coke oven workers are exposed to may differ from that present in ambient air, or derived from soil contamination. It is noted that an inhalation unit risk is in the same order of magnitude as that derived using a linear multistage model associated with lung tumours in a rat inhalation study from coal tar/pitch condensation aerosols.

**Table 4 Published Non-Threshold Dose-Response Values for PAHs - Inhalation**

| PAH | Agency | Inhalation Unit Risk Factor $(\mu g/m^3)^{-1}$ | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|---|
| Benzo[a]pyrene | WHO | $8.7 \times 10^{-2}$ | WHO 2000a, WHO 2010 | Lung cancer | Human | - | WHO, 1999 |

WHO – World Health Organisation

## Adopted Dose-Response Values

The adopted toxicological data were chosen in accordance with the enHealth (2012) hierarchical guidance for selection of toxicological data (Section 5.12). It is noted that this guidance states that "….*it may be assumed that Australian guidance values accorded Level 1 status should take precedence over other sources, provided they are reasonably current. Other Level 1 sources may be more useful where it can be established that they are based on more contemporary risk assessment methodologies*".

**Threshold (Non-Carcinogenic)**

**Table 5 Adopted Dose-Response Values for Threshold (Non-Carcinogenic) PAHs**

| PAHs | Dose-Response Value (mg/kg/day) | Published By |
|---|---|---|
| **Oral** | | |
| Acenaphthene | 0.06 | USEPA, 1994 (IRIS database) |
| Anthracene | 0.3 | USEPA,1993 (IRIS database) |
| Fluoranthene | 0.04 | US EPA, 1993 (IRIS database) |
| Fluorene | 0.04 | USEPA, 1990 (IRIS database) |
| Phenanthrene | 0.04 | RIVM, 2000 |
| Pyrene | 0.03 | USEPA, 1993 |

**Inhalation**

US EPA and other agencies have not published dose-response values for assessment of threshold health effects associated with inhalation exposure to PAHs. Cancer health effects of PAHs were considered to be the primary risk driver via the inhalation pathway, and will be assessed assuming carcinogenic health effects (see below).

**Non-Threshold (Carcinogenic)**

**Table 6 Adopted Dose-Response Values for Non-Threshold (Carcinogenic) PAHs**

| PAHs | Dose-Response Value | Published By |
|---|---|---|
| **Oral (mg/kg/day)$^{-1}$** | | |
| Benzo[a]pyrene | 0.43 | NHMRC, 2011 |
| **Inhalation Unit Risk (µg/m$^3$)$^{-1}$** | | |
| Benzo[a]pyrene | 8.7 x $10^{-2}$ | WHO 2000a, WHO 2010 |

In order to assess potential oral and inhalation health effects associated with exposure to potentially carcinogenic PAHs other than benzo(a)pyrene, the TEFs presented in **Table 3** were adopted. TEFs were adopted only for carcinogenic PAHs considered to be genotoxic carcinogens, i.e. benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(g,h,i)perylene, chrysene, dibenzo(a,h)anthracene and indeno(1,2,3-cd)pyrene.

# PCDDs and PCDFs

The majority of the following information has been sourced from DEH (2005), with other sources listed in the references.

## General

Polychlorinated dibenzo-p-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) are chlorinated tricyclic aromatic hydrocarbons made up of two benzene rings joined by either two oxygen atoms at adjacent carbons on each of the benzene rings (PCDDs) or by one oxygen atom and one carbon-carbon bond (PCDFs). In total, there are 75 possible PCDD congeners and 135 possible PCDF congeners. Congeners containing three or fewer chlorine atoms are considered to be of no toxicological significance. However, 17 congeners with chlorine atoms substituted in the 2, 3, 7 and 8 positions (i.e. in the lateral positions of the aromatic rings) are thought to pose a risk to human health and the environment.

PCDDs and PCDFs are typically considered together with dioxin-like polychlorinated biphenyls (PCBs) as 'dioxin-like compounds.' In general, dioxin-like compounds have very low water solubility, high octanol-water partition coefficients, low vapour pressure and adsorb strongly to particles and surfaces (high $K_{OC}$) and are resistant to chemical degradation under normal environmental conditions. Thus, they are persistent in the environment and their high fat solubility results in their bioconcentration into biota and biomagnification up the food chain.

PCDDs and PCDFs are not manufactured intentionally; instead they are by-products of combustion, including industrial processes such as waste incineration, bleached kraft pulp mills and the synthesis of certain chemicals. Other sources of dioxin-like chemicals can include contaminated stockfeed (for cattle, chicken and farmed fish), improper application of sewage sludge to agricultural land, flooding of pastures, waste effluents and certain types of food processing. PCDDs and PCDFs are also associated with pesticides such as pentachlorophenol (PCP) and 2,4,5-trichlorophenoxyacetic acid (2,4,5-T), however these chemicals are no longer approved for use in Australia.

PCDDs and PCDFs are formed naturally by volcanoes and forest fires. It has been estimated that bushfires may contribute at least 20-30% of the total release of dioxin-like compounds to the Australian environment.

Atmospheric transport represents the primary route for transport of dioxins into the environment.

## Significance of Exposure Pathways and Background

For the general population, over 95% of exposure to dioxin-like compounds is through the diet, with foods of animal origin such as meat, dairy products and fish being the main sources (particularly foods high in animal fats). Cigarette smokers are likely to have somewhat higher intakes of dioxins than non-smokers. Because of the ubiquitous presence of various dioxin-like compounds in human tissues, as well as in the milk of mothers worldwide, infants can be exposed to these compounds both prenatally and during breast feeding.

Exposure to dioxin like compounds may also be through other routes such as breathing in air contaminated by dioxins in smoke (from bushfires, domestic wood heaters and cigarettes), factory or incinerator emissions, motor vehicle exhaust fumes, or from uncontrolled hazardous waste sites containing dioxins.

Since dioxins are fat soluble, chemically stable and poorly metabolised, they can concentrate in body fat and build up under conditions of long-term exposure, both in animals and humans, and accumulate as they move through the food chain. The congeners that make up the dioxins have half-lives that vary from 3.7 years for the least persistent type to 50 years for the most persistent, with an average half-life of approximately 7 years.

In Australia, concentrations of dioxin-like compounds in breast milk have fallen significantly (about 45%) within the past decade, an observation consistently noted in monitoring programs from a large

number of other countries. This reflects a world-wide trend over recent decades of declining levels of dioxin-like compounds in the environment and in human tissues.

The average intake of dietary dioxins (per unit bodyweight) in the general Australian population was calculated to be between 10-54% of the tolerable monthly intake (TMI), and somewhat higher in infants and toddlers.

Ambient levels of dioxins in Australian soils measured during the National Dioxins Program ranged from below the limit of detection (about 0.05 pg/g dry weight) to 43 pg/g dry weight, with upper bound means of total dioxins based on land use ranging from 0.38 TEQ pg/g dry weight (remote area) to 6.4 pg/g dry weight (urban area).

The intake of dioxins from ingestion of water is considered to be negligible as dioxins have very low water solubility. Studies have found that estimated intakes from water were one thousandth or less of the estimated overall intake for dioxins.

WHO (2000c) assumed an ambient air toxic equivalent level of PCDDs and PCDFs of about 0.1 $pg/m^3$, however certain industrial and urban areas may have up to 20 times higher air concentrations. Intake from inhalation exposure was on average 1% of the dietary intake.

A background intake of dioxins and furans was calculated based on a blood serum study presented in DEH (2004). The mean average lifetime daily exposure (ALDE) was estimated as 1.3 TEQ pg/kg bw/day. The mean ALDE was converted to months (i.e. 40.15 TEQ pg/kg bw/day), which is 57% of the published tolerable monthly intake (TMI) of 70 pg TEQ/kg body weight/month. Therefore, a background percentage of 57% has been adopted.

## Non-Carcinogenic Health Effects

The most widely studied of all the dioxin-like compounds is 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD, or TCDD). It has been shown to affect a wide range of organ systems in many animal species and can induce a wide range of adverse biological responses including immunotoxicity, endometriosis in Rhesus monkeys, developmental, behavioural effects in offspring of treated Rhesus monkeys, and developmental and reproductive effects in rats. Studies in animals indicate that the immune system is a sensitive target of TCDD toxicity, with inhibition of immunoglobulin secretion and decreased resistance to bacterial, viral, and parasitic infections.

Available epidemiological data indicate that dioxin-like compounds produce a variety of biochemical responses in humans, some of which occur at relatively low exposure levels. Induction of hepatic enzymes, changes in hormone levels and reduced glucose tolerance are examples of subtle changes that may occur at comparatively low exposures. However, these effects are of unknown clinical significance.

The most widely recognised and consistently observed effect in humans following high dose exposure to TCDD is chloracne. The condition can disappear after termination of exposure or can persist for many years. Other effects on the skin include hyperpigmentation and hirsutism.

There is some suggestive evidence of dioxin exposure toxicity to the cardiovascular system, including hyperlipidemia, increased frequency of ischaemic heart disease, valvular heart disease and retinopathy.

Neurological symptoms observed in TCDD-exposed workers include lassitude, weakness of the lower limbs, muscular pains, increased perspiration, loss of appetite, headaches, nervousness, anxiety, irritability, and loss of libido.

TCDD has also been associated with temporary enlargement of the liver, increased levels of hepatic enzymes and alterations in the lipid profile in humans. Data from several epidemiological studies suggest that significant exposure to TCDD increases the risk of diabetes mellitus resulting from decreased cellular glucose uptake. TCDD exposure has additionally been associated with changes in thyroid function.

Acute exposure to high concentrations of TCDD has been associated with effects on the respiratory system, including upper respiratory tract irritation, conjunctivitis, and inflamed eyelids (blepharitis).

## Identification of Non-Carcinogenic Toxicity Reference Values

The dose-response values provide an estimate of exposure to the human population that is likely to be without an appreciable risk of deleterious effects during a lifetime. The oral exposure represents a daily value and the inhalation exposure represents continuous inhalation. These values are intended for use in risk assessments for health effects known or assumed to be produced through a nonlinear (presumed threshold) mode of action (USEPA, 2012). Available chronic dose-response values published by sources recognised and endorsed by enHealth (enHealth, 2004), NEPC (NEPC, 1999) and the USEPA and are summarised below.

Due to their bioaccumulative nature, it is noted that the biochemical and toxicological effects of dioxin-like compounds relate more closely to their concentration in the target tissue than to the daily dose. Numerous agencies therefore adopted values based on body burden.

### Oral

The oral dose-response value is expressed in units of mg/kg/day. This value may be termed a Reference Dose (RfD), Tolerable Daily Intake (TDI), or Minimal Risk Level for oral exposure (MRL) depending on the agency of derivation.

**Table 1 Published Threshold Dose-Response Values for Dioxin-like Compounds - Oral**

| Agency | Dioxin | Oral Dose-Response Value | Source | Target Endpoint | Test Animal | UF | Notes |
|---|---|---|---|---|---|---|---|
| WHO (JECFA) | Dioxin-like compounds | 2.3 pg TEQ/ kg bw/day | FAO/ WHO (2005) | Reproductive toxicity | Rats | 3.2-9.6 | Provisional TMI of 70 pg TEQ/kg bw based on body burden. Mid-point of range in Oshako et al., 2001 and Faqi et al., 1998. |
| WHO | Dioxin-like compounds | 1-4 pg TEQ/ kg bw/day | WHO (2000) | Hormonal, reproductive and developmental effects | Rats; monkeys | 10 | TDI based on body burden. Based on study by Van Leeuwen & Younes, 1998. Adopted in France, Germany, Netherlands and New Zealand (NZ: 30 pg /kg/month) |
| US EPA | TCDD | 0.7 pg/kg/day | IRIS (2012) | Decreased sperm count and mobility; increased TSH in utero | Humans | 30 | RfD. Based on study by Mocarelli et al., 2008 and Baccarelli et al., 2008. |
| EC-SCF | Dioxin-like compounds | 2 pg TEQ/ kg bw/day | EC-SCF (2001) | Developing reproductive systems of male rats exposed in utero | Rats | 9.6 | TWI of 14 pg/kg bw/week for TCDD. Based on study by Faqi et al., 1998. Adopted in the UK. |
| ATSDR | TCDD | 1 pg TEQ/kg bw/day | ATSDR (1998) | Neuro-behavioural developmental changes | Monkeys | 90 | MRL. Based on study by Schantz et al., 1992. Intended to also serve as guidance for total TEQs of dioxin-like compounds. |
| ATSDR | 2,3,4,7,8-PnCDF | 0.00003 µg/kg/day | ATSDR (1994) | Hepatic effects (increased serum bilirubin, decreased serum triglycerides) | Rats | 3000 | Intermediate oral MRL (15-364 days). Based on Pluess et al, 1988 and Poiger et al, 1989. |

JECFA - Joint FAO/WHO Expert Committee on Food Additives
ATSDR – Agency for Toxic Substances and Disease Registry

EC-SCF – European Commission Scientific Committee on Food
COT – Committee on the Toxicity of Chemicals in Food
IRIS – Integrated Risk Information System.
UF – Uncertainty Factor
TMI – Tolerable monthly intake

NHMRC adopted the TMI of 70 pg TEQ/kg bw in *Dioxins: Recommendation for a Tolerable Monthly Intake for Australians* (October 2012), however this document was rescinded in 2013.

In order to assess potential oral health effects associated with exposure to potentially carcinogenic dioxin-like compounds other than 2,3,7,8-TCDD, Toxic Equivalence Factors (TEFs) have been adopted. It may be inferred that biochemical, cellular and tissue-level effects that are elicited by exposure to TCDD are also induced by other chemicals that have a similar structure and that also bind to the Ah receptor. The TEFs are used to estimate the potency of dioxin-like compounds relative to TCDD, applying the concept of additivity for the PCDDs, PCDFs and dioxin-like PCBs to provide total Toxic Equivalence Quotient (TEQ) estimates. The adopted TEFs are shown in **Table 2** below.

**Table 2 TEFs Used to Derive Oral Dose-Response Criteria for Carcinogenic Dioxin-like Compounds Relative to 2,3,7,8-TCDD (WHO, 2005)**

| Dioxin-like Compounds | Toxic Equivalency Factor (TEF) |
|---|---|
| **PCDDs** | |
| 2,3,7,8-TCDD | 1 |
| 1,2,3,7,8-PnCDD | 1 |
| 1,2,3,4,7,8-HxCDD | 0.1 |
| 1,2,3,6,7,8-HxCDD | 0.1 |
| 1,2,3,7,8,9-HxCDD | 0.1 |
| 1,2,3,4,6,7,8-HpCDD | 0.01 |
| OCDD | 0.0003 |
| **PCDFs** | |
| 2,3,7,8-TCDF | 0.1 |
| 1,2,3,7,8-PnCDF | 0.03 |
| 2,3,4,7,8-PnCDF | 0.3 |
| 1,2,3,4,7,8-HxCDF | 0.1 |
| 1,2,3,6,7,8-HxCDF | 0.1 |
| 1,2,3,7,8,9-HxCDF | 0.1 |
| 2,3,4,6,7,8-HxCDF | 0.1 |
| 1,2,3,4,6,7,8-HpCDF | 0.01 |
| 1,2,3,4,7,8,9-HpCDF | 0.01 |
| OCDF | 0.0003 |
| **PCBs** | |
| WHO TEF Values include PCB 77, PCB 81, PCB 126, PCB 169, PCB 105, PCB 114, PCB 118, PCB 123, PCB 156, PCB 157, PCB 167 and PCB 189 (outside the scope of this ToxProfile). | |

However, it is noted that estimates of population exposures suggest that a significant proportion of the total intake of dioxin-like compounds (measured as TEQs) is from congeners other than TCDD.

### Inhalation

No information available. WHO (200a) stated that an air quality guideline for PCDDs and PCDFs was not proposed because direct inhalation exposures constitute only a small proportion of the total exposure, generally less than 5% of the daily intake from food (and 1% on average).

## Carcinogenicity and Genotoxicity

Most data on the health effects of PCDDs and PCDFs have been obtained using the most toxic congener, TCDD. Experimental studies demonstrate that TCDD is carcinogenic in all species and strains of laboratory animals tested. It has been characterised as a multi-site carcinogen. However,

short-term studies have shown a lack of direct DNA-damaging effects, indicating that TCDD is not an initiator of carcinogenesis, but is a potent tumour promoter. Although the mechanisms of carcinogenicity are not fully known, the ability of TCDD to enhance proliferation and inhibit apoptotic processes in focal hepatic lesions supports an indirect mechanism of carcinogenicity.

The results of a two-year carcinogenesis bioassay conducted by Kociba *et al* (1978) have been the most often utilised for cancer risk assessment of TCDD. Sprague Dawley rats of both genders were given TCDD (99% pure) in the feed to achieve intakes of 0, 1, 10 and 100 ng/kg bw/day. Results indicated that at 100 ng/kg bw/day, TCDD caused an increase in the incidence of hepatocellular hyperplastic nodules and carcinomas in female (but not in male) rats. At this dose, statistically significant increases in squamous cell carcinomas of the lungs (females) and tongue and nasal palate/nasal turbinates (males) were also reported. However, this does of TCDD was also associated with a significant reduction in the incidence of some tumours.

Epidemiological evidence from the most highly exposed occupational cohorts studied produces the strongest evidence in humans of an increased cancer risk from exposure to dioxins, when the data are considered for all cancers combined.

From the occupational studies, and an understanding of biological plausibility as shown by animal studies, the International Agency for Research on Cancer (IARC) has concluded that TCDD is carcinogenic to humans (Group 1). The IARC determined that other PCDDs and PCDFs are not classifiable as to their carcinogenicity to humans (Group 3).

No experimental data in animals on the cancer risks from inhalation exposure to dioxins was presented in the sources reviewed, and human health inhalation associated with cigarettes are confounded by their other carcinogenic compounds.

Dioxin-like compounds are not considered to be genotoxic carcinogens. It is considered that the mechanism of carcinogenesis, involving the Ah receptor, means that there is a threshold for carcinogenicity. Tolerable intake guidance based on non-cancer end-points is considered protective for carcinogenicity (WHO, 2010).

## Identification of Carcinogenic Toxicity Reference Values

### Oral

The oral dose-response value is expressed in units of $(mg/kg/day)^{-1}$. This value may be termed a Cancer Slope Factor (CSF), a Cancer Risk (CR), Slope Factor (SF), or Risk Specific Dose (RSD) depending on the agency of derivation. Some agencies present guideline values which may be converted to dose-response values.

**Table 3 Published Non-Threshold Dose-Response Values for Dioxin-like Compounds – Oral**

| Agency | Oral Cancer Slope Factor $(mg/kg/day)^{-1}$ | Notes | Source |
|---|---|---|---|
| IRIS | $6.2 \times 10^{3}$ | HxCDD (mixture of 1,2,3,6,7,8-HxCDD and 1,2,3,7,8,9-HxCDD). Hepatic tumours in mice and rats by gavage. Geometric mean of slope factors for mice and rats. Drinking water unit risk of 0.18 µg/L. | USEPA, 1987 |

IRIS – Integrated Risk Information System.

FAO/WHO (2005) noted that the establishment of a tolerable intake based on non-cancer effects would also address any carcinogenic risk. Similarly, the EC-SCF (2001) noted that the most sensitive endpoints in animal studies were developmental and reproductive effects and that the TWI they established would adequately protect against the carcinogenic effects of TCDD, which require substantially higher body burdens, and for which a threshold approach is applicable due to its non-genotoxic nature. As such, separate carcinogenic toxicity reference values were not derived by these or other bodies reviewed.

### Inhalation

The inhalation dose-response value is expressed in units of $mg/m^3$. This value may be termed a Unit Risk (UR), Cancer Risk (CR), Risk Specific Concentration (RSC) or Toxic Dose (that corresponds to a 5% increase in mortality) ($TD_{0.05}$) depending on the agency of derivation.

**Table 4 Published Non-Threshold Dose-Response Values for Dioxin-like Compounds - Inhalation**

| Agency | Inhalation Unit Risk Factor $(mg/m^3)^{-1}$ | Notes | Source |
|---|---|---|---|
| IRIS | 0.0013 | HxCDD (mixture of 1,2,3,6,7,8-HxCDD and 1,2,3,7,8,9-HxCDD). Air concentration of $8 \times 10^{-6}$ $(\mu g/m^3)^{-1}$ based on $10^{-5}$ risk level. | USEPA, 1987 |

IRIS – Integrated Risk Information System.

## Adopted Dose-Response Values

Dose-response values for threshold and non-threshold effects associated with oral or inhalation exposure to dioxin-like compounds (or individual PCDDs or PCDFs) have not been published by Australian regulatory bodies.

### Threshold (Non-Carcinogenic)

For assessment of potential threshold effects associated with oral exposure to dioxin-like compounds (PCDDs, PCDFs and dioxin-like PCBs), AECOM has adopted the reference dose of **2.3 pg TEQ/kg bw/day** published by FAO/ WHO (2005).

An inhalation reference concentration was not adopted by AECOM due to the limited information available, as direct inhalation exposures constitute only a small proportion of the total exposure, on average 1% of the daily intake from food.

### Non-Threshold (Carcinogenic)

Dioxin-like compounds are considered to be threshold carcinogens, and as such, non-threshold dose-response values were not adopted by AECOM. As noted by FAO/WHO (2005), the establishment of a tolerable intake based on non-cancer effects would also address any carcinogenic risk as the most sensitive endpoints are not carcinogenic in nature.

# Chromium – Toxicological profile

The following information has been taken from ATSDR (2008):

**General**

Chromium is a naturally-occurring element found widely in the environment in the form of chromium (0), chromium (III), and chromium (VI). It is widely used in manufacturing processes and found in many products such as wood treated with copper dichromate, leather tanned with chromic sulfate and stainless steel cookware.

Chromium can be found in air, soil, and water after release from manufacture, use and disposal of chromium-based products, and during the manufacturing process. Chromium does not usually remain in the atmosphere, but is deposited into the soil and water. It can change from one form to another in water and soil depending on the conditions present and does is eventually deposited in soil and water.

**Significance of Exposure Pathways and Background**

In accordance with the ASC NEPM (2013), background intakes from other sources (as a % of the TRV):

Bio = 10% for oral and dermal intakes

Bli = 0% for inhalation

**Non-carcinogenic Health Effects**

In general, chromium (VI) compounds are more toxic than chromium (III) compounds.

Chromium (III) and chromium(VI) can penetrate human skin to some extent, especially if the skin is damaged. Absorbed chromium distributes to nearly all tissues, with the highest concentrations found in kidney and liver. Bone is also a major depot and may contribute to long-term retention kinetics or chromium. Chromium (VI) is reduced to chromium (III) via the intermediate forms of chromium (V), chromium (IV).

Chromium (VI) in blood is taken up into red blood cells, where it undergoes reduction and forms stable complexes with hemoglobin and other intracellular proteins, which are retained for a substantial fraction of the red blood cell lifetime. Absorbed chromium can be transferred to fetuses through the placenta and to infants via breast milk.

Most quantitative studies of the gastrointestinal absorption of chromium in humans have estimated the absorption fraction to be <10% of the ingested dose with more soluble forms being more rapidly absorbed than insoluble compounds. Absorption is also affected by nutritional status; the absorption fraction is higher when dietary intakes are lower.

***Chromium (VI)***

The primary effects associated with exposure to chromium(VI) compounds are respiratory, gastrointestinal, immunological, hematological, reproductive, and developmental. In addition, dermal and ocular irritation may occur from direct contact. Based on available dose-response data in humans and animals, the most sensitive noncancer effects of chromium(VI) compounds are respiratory (nasal and lung irritation, altered pulmonary function), gastrointestinal (irritation, ulceration and nonneoplastic lesions of the stomach and small intestine), hematological (microcytic, hypochromic anemia), and reproductive (effects on male reproductive organs, including decreased sperm count and histopathological change to the epididymis). Respiratory and gastrointestinal effects appear to be portal-of-entry effects for inhalation and oral exposure, respectively. Similarly, chromium sensitization, the major immunological effect of chromium(VI), typically presents as allergic contact dermatitis resulting from dermal exposures in sensitized individuals, although respiratory effects of sensitization (asthma) may also occur. Accidental or intentional ingestion of extremely high doses of chromium(VI) compounds by humans has resulted in severe respiratory, cardiovascular, gastrointestinal, hematological, hepatic, renal, and neurological effects as part of the sequelae leading to death or in patients who survived because of medical treatment.

***Chromium (III)***

Although much less information is available on the health effects of chromium (III) and chromium (III) compounds, they appear to be much less toxic than chromium (VI) compounds and are vital for normal metabolic activity. Health effects associated with exposure to chromium (III) compounds have been reported in studies of occupationally exposed populations and individuals; however, interpretation of study results is complicated by concomitant exposures to chromium (VI) or other compounds that can induce adverse health effects. Similarly, interpretation of findings in case reports of exposures to dietary supplements containing high-dose chromium(III)

are also complicated, since most supplements contain numerous chemicals; thus, the most reliable information on adverse health effects of chromium(III) is obtained from studies in animals.

The primary effects of chromium (III) compounds are on the respiratory and immunological systems. Respiratory effects appear to be portal-of-entry effects for inhalation exposure. Similarly, chromium allergic dermatitis, the major immunological effect of chromium (III), is typically elicited by dermal contact in sensitized individuals; however, initial sensitization may result from inhalation, oral, or dermal exposure or from a combination of these exposure routes. Conflicting results of studies in animals have been reported in developmental and reproductive studies of chromium (III) compounds; however, results provide evidence of adverse effects on the developing and adult reproductive system. Evidence of developmental or reproductive effects of chromium (III) in humans has not been identified. Based on results of chronic-duration oral studies in animals, chromium (III) compounds (chromium acetate, chromium chloride, chromium nicotinate, chromium oxide, chromium picolinate) do not appear to produce gastrointestinal, hematological, hepatic, renal, cardiovascular, endocrine, or musculoskeletal effects. This is in contrast to chromium (VI) compounds which produce effects in the gastrointestinal, hematological, hepatic and renal systems.

**Carcinogenicity and Genotoxicity**

Occupational exposure (via inhalation) to chromium (VI) compounds (calcium chromate, chromium trioxide, lead chromate, strontium chromate, and zinc chromate) in various industries has been associated with increased risk of respiratory system cancers, primarily bronchogenic and nasal. Environmental exposure of humans to chromium (VI) in drinking water resulted in statistically significant increases in stomach cancer.

No studies evaluating the carcinogenic activity of chromium (III) compounds in humans were identified and animal studies were inconclusive.

The International Agency for Research on Cancer (IARC) classified chromium (VI) as *carcinogenic to humans (Group 1)* and metallic chromium and chromium (III) compounds as *not classifiable as to their carcinogenicity to humans (Group 3)*.

In-vivo and in-vitro studies indicate chromium (VI) has genotoxic properties however there is no indication that chromium (III) exhibits genotoxic potential.

**Published Dose-Response Values**

Available chronic dose-response values published by sources recognised and endorsed by NEPC (1999) and enHealth (2004) are summarised in the following table.

**Table 1: Published Dose-Response Values for Chromium (VI) and Chromium (III)**

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| **Chromium (VI)** | | | | | |
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.0014 mg/kg/day | NHMRC (2004) | |
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.0014 mg/kg/day | WHO (2008) | |
| Oral | Minimal Risk Level (MRL) | Threshold | 0.001 mg/kg/day | ATSDR (2008) | |
| Oral | Reference Dose (RfD) | Threshold | 0.003 mg/kg/day | USEPA (2011) | |

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Inhalation | Minimal Risk Level (MRL) | Threshold | 0.000005 $mg/m^3$ | ATSDR (2008) | For chromium (VI) as chromium trioxide mist and other hexavalent chromium aerosols and mists. Not considered relevant to assessment of exposure to chromium (VI) particulates derived from contaminated soil. |
| Inhalation | Reference Concentration (RfC) | Threshold | 0.0001 $mg/m^3$ | USEPA (2011) | Chromium (VI) particulates |
| Inhalation | Unit Risk | Non threshold | 0.04 $(ug/m^3)^{-1}$ | WHO (2000a) | |
| Inhalation | Unit Risk | Non threshold | 0.011-0.13 $(ug/m^3)^{-1}$ | WHO (2000b) | |
| Inhalation | Unit Risk | Non threshold | 0.012 $(ug/m^3)^{-1}$ | USEPA (2011) | |
| **Chromium (III)** | | | | | |
| Oral | Reference Dose (RfD) | Threshold | 1.5 mg/kg/day | USEPA (2011) | |
| Oral | Reference Dose (RfD) | Threshold | 1.5 mg/kg/day | USEPA (2010) | |
| Inhalation | Minimal Risk Level (MRL) | Threshold | 0.0001 $mg/m^3$ | ATSDR (2008) | Intermediate duration inhalation exposure to soluble trivalent chromium particulate compounds |

**Adopted Threshold Dose-Response Values**

**Chromium (VI)**

For assessment of potential threshold effects associated with oral exposure to chromium (VI), AECOM has adopted the minimal risk level (MRL) of 0.001 mg/kg/day adopted by ATSDR (2008).

For assessment of potential threshold effects associated with inhalation exposure to chromium (VI), AECOM has adopted the RfC of 0.0001 $mg/m^3$ published by USEPA (2010) for chromium (VI) particulates. Note that the ATSDR MRL of 0.000005 $mg/m^3$ for hexavalent chromium aerosols and mists was not considered relevant to assessment of exposure to chromium (VI) particulates derived from contaminated soil.

**Chromium (III)**

For assessment of potential threshold effects associated with oral exposure to chromium (III), AECOM has adopted the USEPA (2010) reference dose (RfD) of 1.5 mg/kg/day.

For assessment of potential threshold effects associated with inhalation exposure to chromium (III), AECOM has adopted the ATSDR (2008) intermediate duration MRL of 0.0001 $mg/m^3$. While this value was derived for intermediate exposure duration, it is considered likely to be suitably protective for assessment of chromium (III) given that:

- The ATSDR MRL is identical to the USEPA (2010) RfC for chromium (VI); and

- chromium (III) compounds appear to be much less toxic than chromium (VI) compounds.

**Adopted Non-Threshold (Carcinogenic) Dose-Response Values**

**Chromium (VI)**

To AECOM's knowledge, non-threshold dose-response criteria for oral exposure to chromium (VI) have not been published by Australian or other regulatory bodies. Potential health effects associated with oral exposure to chromium (VI) have therefore been assessed on the basis of threshold dose response criteria.

For assessment of potential non-threshold effects associated with inhalation exposure to chromium (IV), AECOM has adopted the unit risk of 0.04 $(ug/m3)^{-1}$ published by WHO (2000a).

**Chromium (III)**

To AECOM's knowledge, non-threshold dose-response criteria for oral and inhalation exposure to chromium (III) have not been published by Australian or other regulatory bodies. Potential health effects associated with oral or inhalation exposure to chromium (III) have therefore been assessed on the basis of threshold dose response criteria.

# Cyanide – Toxicological profile

The following information has been taken from ATSDR (2005):

**General**

Cyanides are both naturally occurring and man-made and many are powerful and rapid-acting poisons. Hydrogen cyanide, sodium cyanide, and potassium cyanide are the forms of cyanide and are most likely to be in the environment as a result of industrial activities. Certain bacteria, fungi, and algae can also produce cyanide, and it is also found in a number of foods and plants.

Many of the cyanides in soil and water come from industrial processes such as metal mining, organic chemical industries, iron and steel plants or manufacturers, and publicly owned wastewater treatment facilities. Automotive exhausts are a source of cyanides, as are fumes from the incineration of municipal waste and cyanide containing pesticides.

Cyanide enters air, water, and soil from both natural processes and industrial activities. Airborne cyanide is present mainly as gaseous hydrogen cyanide and is generally far below levels that would cause concern. A small amount of cyanide in air is present as fine dust particles. This dust eventually settles over land and water and is removed from air by rain and snow. Most cyanide in surface water will form hydrogen cyanide and evaporate. Some cyanide in water will be transformed into less harmful chemicals by microorganisms or will form a complex with metals, such as iron. Cyanide in water does not build up in the bodies of fish.

Cyanides are fairly mobile in soil and can be converted to hydrogen cyanide gas or other chemical forms by microorganisms present in the soil. Cyanides usually do not seep into underground water however cyanide has been detected in underground waters of landfills and industrial waste disposal sites. At the high concentrations found in some landfill leachates and in the wastes stored in some disposal sites, cyanide becomes toxic to soil microorganisms. Because these microorganisms can no longer change cyanide to other chemical forms, cyanide is able to passes through soil into underground water.

**Non-carcinogenic Health Effects**

The toxicity of individual cyanide compounds is dependent on the ease with which they release cyanide anion ($CN^-$). For example, cyanide radicals have a low affinity for alkali metals and a high affinity for ferric iron ($Fe^{3+}$) and other metals; therefore, simple cyanide salts (for example, sodium cyanide or potassium cyanide) are toxic, whereas certain iron-containing cyanide compounds do not release $CN^-$ readily and are nearly nontoxic. Cyanide exerts its primary toxicological effects by binding to the metallic cofactor in metalloenzymes, thereby impairing enzyme and cell function. Cytochrome c oxidase is the most significant target of cyanide exposure since its inhibition prevents tissues from using oxygen causing histiotoxic hypoxia. The most vulnerable tissues are those with the highest oxygen demand and/or a deficiency in detoxifying enzymes such as rhodanese. The inhibition of oxygen use by cells causes oxygen tensions to rise in peripheral tissues; this results in a decrease in the unloading gradient for oxyhemoglobin. Thus, oxyhemoglobin is carried in the venous blood, which is one biomarker of cyanide exposure. In addition to binding to cytochrome c oxidase, cyanide inhibits enzymatic activity of a wide variety of enzymes which contribute to the signs of cyanide toxicity.

Although the entire body is affected by cyanide exposure, adverse effects on the central nervous system are of the most consequence to the organism because of the high metabolic demand for oxygen in neurons and its control of respiratory function. Initial stimulation of carotid and aortic bodies and effects on the central nervous system adversely affect the function of the respiratory system, which contributes to the global histiotoxic hypoxia leading to death. High inhalation, oral, or dermal exposure levels result in convulsions, unconsciousness, and death due to inactivation of the centers controlling respiration. Lower exposures may result in headache or dizziness.

The signs of cyanide toxicity at concentrations leading to death in humans are well described: intoxication, followed by a brief sensation of dryness and burning in the throat, suffusing warmth, and a hunger for air. Within 1 minute apnea develops and symptoms worsen with loss of consciousness and convulsions. Cardiovascular failure may also occur, although the heart may continue to beat for 3– 4 minutes after the last breath. Reported signs sometimes include a bitter almond-like odor on the breath and (in light-toned individuals) a rose-colored hue of the skin. Dermal exposure to cyanide results in comparable effects, but at higher doses.

Nonlethal exposures to hydrogen cyanide gas produces upper respiratory irritation, cough, altered sense of smell, nasal congestion, epistaxis, hemoptysis, and dyspnea in exposed workers. Workers acutely exposed to cyanogen, which dissociates into hydrogen cyanide and hydrocyanic acid, experienced nasal irritation. Other

effects observed at nonlethal exposure levels include hypotension, heart palpitations, precordial pains, nausea and vomiting resulting from central nervous system stimulation or direct contact with cyanide, and albinuria. Animal studies also report bradycardia, arrhythmia, and T-wave abnormalities, vomiting, increased blood urea nitrogen, and histopathology of the renal proximal tubular epithelium and glomeruli. Hepatic effects have not been reported in humans, but have been observed in some animal studies.

Thyroid effects following cyanide exposure result from the interference of thiocyanate, a metabolite of cyanide, with iodine uptake and utilization in the thyroid gland. Enlargement of the thyroid gland and increased levels of thyroid stimulating hormone were observed in workers exposed by inhalation. No data were available for cyanide-induced neurotoxicity in humans following intermediate-duration exposures by any route, but a number of animal studies are available, none of which, systematically evaluated neurotoxicity using a neurobehavioral test battery. Following repeated inhalation exposure to cyanide, transitory neurobehavioral effects (increased response rates without encephalopathy) were observed in monkeys and more serious effects (tremors, rigidity, ataxia, atrophy of Purkinje cells, and vasodilation and hemorrhage in the brain) were observed in dogs, the most sensitive species tested. Oral exposure studies administered cyanide salts by oral gavage, in drinking water, or diet. In oral gavage studies in pigs or rats, behavioral changes (reduced activity) were observed at doses between 0.14 and 0.8 mg cyanide/kg/day and more serious effects (tremors, convulsions) were observed at 7.8 mg CN–/kg/day, a lethal dose. No encephalopathy or overt signs of neurotoxicity were observed following repeated exposure via drinking water to doses as high as 12.5 mg CN–/kg/day in rats or 28.8 mg CN–/kg/day in mice. Myelin degeneration of spinal cord tracts was observed in rats receiving 30 mg CN–/kg/day via dietary exposure.

Chronic exposure to lower cyanide concentrations in occupational settings causes a variety of symptoms from fatigue, dizziness, and headaches to ringing in the ears, paresthesias of extremities, and syncopes, or even hemiparesis and hemianopia. In addition, behavioral changes were reported following prolonged cyanide exposure with loss of memory and decreases in visual acuity, psychomotor ability, and visual learning reported in workers. It is possible, however, that during occupational exposure, such as electroplating operations, chemicals other than cyanide may have contributed to the effects observed.

Chronic neurological effects are exacerbated by nutritional deficiencies or other disorders that provide inadequate levels of thiosulfate needed to detoxify cyanide. Among those observed were hyperreflexia or spastic paraparesis of the extremities, spastic dysarthria, visual and hearing difficulties, and cerebellar signs.

**Carcinogenicity and Genotoxicity**

There is no evidence that cyanide exposure is correlated with carcinogenicity in humans or animals.

Cyanide has only an indirect genotoxic effect in vivo and in vitro, in that dying cells release endonucleasese into the cytosol, ultimately resulting in DNA fragmentation.

**Published Dose-Response Values**

Available chronic dose-response values published by sources recognised and endorsed by NEPC (1999) and enHealth (2004) are summarised in the following table.

**Table 1: Published Dose-Response Values for Cyanide**

| Route of Exposure | Type | Threshold or Non-Threshold | Value | Source | Notes |
|---|---|---|---|---|---|
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.012 mg/kg/day | NHMRC (2004) | |
| Oral | Acceptable Daily Intake (ADI) | Threshold | 0.012 mg/kg/day | WHO (2008) | Protective for acute and long term exposure |
| Oral | Minimal Risk Level (MRL) | Threshold | 0.05 | ATSDR (2005) | Intermediate duration exposure |
| Oral | Reference Dose (RfD) | Threshold | 0.02 mg/kg/day | USEPA (2011) | |

**Adopted Threshold Dose-Response Values**

For assessment of potential threshold effects associated with oral exposure to cyanide, AECOM has adopted the acceptable daily intake (ADI) of 0.012 mg/kg/day adopted by the NHMRC (2004) for the derivation of drinking water guideline values.

To AECOM's knowledge, threshold dose-response criteria for inhalation exposure to cyanide have not been published by Australian or other regulatory bodies. AECOM has therefore adopted a route-to-route (oral to inhalation) extrapolation approach for assessment of inhalation effects of cyanide. The oral ADI of 0.012 mg/kg/day was converted to a Tolerable Concentration in air of 0.042 $mg/m^3$ assuming an adult body weight of 70 kg and a daily inhalation volume of 20 $m^3$/day. It is noted that there is substantial uncertainty associated with the use of route-to-route extrapolation, due to differences in e.g., absorption, distribution and metabolism of chemicals via the oral versus inhalation exposure routes. However, this approach has been adopted as a conservative measure in the absence of other data.

**Adopted Non-Threshold (Carcinogenic) Dose-Response Values**

To AECOM's knowledge, non-threshold dose-response criteria for oral and inhalation exposure to cyanide have not been published by Australian or other regulatory bodies. Potential health effects associated with oral and inhalation exposure to cyanide have therefore been assessed on the basis of threshold dose response criteria.

# HiCAl Mineraliser Product Portfolio

## Introduction

HiCAl (**Hi**gher **C**linker **Al**ite) products are designed for use as fluxes[1] and mineralisers[2] in cement manufacture. Benefits include higher alite (or $C_3S$) levels and better sulfur binding in Portland cement clinker along with economic and environmental gain from reduced energy requirements and reduced greenhouse gas emission.

## Features and Benefits of HiCAl Products

HiCAl products are rich in fluoride, sodium, carbon and alumina. Under suitable process conditions, fluoride added to the clinker manufacturing process accelerates the rate of alite formation and causes more alite to form in the cement clinker at a lower temperature. Sodium may add to the quality of the clinker and strength of cement when raw materials are deficient in sodium and positively affecting the sulphur/alkali ratio when burning high sulphur fuels. The carbon in HiCAl provides heat energy when put into the cement clinker process and the alumina may allow to reduce the consumption of other alumina corrective materials.

## Chemical Composition of HiCAl Products

| Description | | Unit | Cement Clinker Mineraliser Products | | | | Test Method |
|---|---|---|---|---|---|---|---|
| | | | HiCAl-R | HiCAl-S | HiCAl 30 | HiCAl 40 | |
| Carbon | | % | 2 to 7 | 5 to 10 | 30 to 35 | 40 to 45 | Liebig technique to Australian Standard AS2434.6 |
| Calorific Value | | Mj/kg | n.a. | n.a. | >9 | >12 | Calorimeter to Australian Standard AS1038.5 |
| Silicon | as $SiO_2$ | % | 30 to 37 | 12 to 20 | 11 to 17 | 6 to 12 | Inductively Coupled Plasma Spectroscopy (ICP/OES) |
| Aluminium | as $Al_2O_3$ | % | 25 to 30 | 25 to 30 | 18 to 23 | 16 to 21 | |
| Iron | as $Fe_2O_3$ | % | 2 to 6 | 6 to 11 | 2 to 7 | 2 to 7 | |
| Calcium | as CaO | % | 1 to 4 | 1 to 4 | 1 to 3 | 1 to 3 | |
| Potassium | as $K_2O$ | % | 0 to 2 | 0 to 2 | 0 to 1 | 0 to 1 | |
| Sodium | as $Na_2O$ | % | 18 to 23 | 24 to 29 | 15 to 20 | 14 to 19 | |
| Sulphur | as $SO_3$ | % | 0 to 2 | 0 to 2 | 0 to 2 | 0 to 2 | |
| Fluoride | total | % | 8 to 12 | 10 to 14 | 8 to 12 | 8 to 12 | Ion Selective Electrode (ISE) |

See following page for trace element analysis.

## Product Sizing and Density

HiCAl products are typically manufactured one of two size fractions:

- 10mm minus with a dry bulk density of 1.3 tonnes per cubic meter
- 20% passing 90 micron with a bulk density of 1 tonne per cubic meter

[1] A flux is a substance that lowers the temperature at which solid materials enter a liquid phase and/or increases the quantity of liquid at a given temperature.

[2] A mineraliser is a substance that accelerates reaction rates and promotes the formation of desired materials in the liquid phase of cement clinker or similar materials. This results in a higher quality product with less residence time and less energy for processes such as cement making.

## Analysis of Trace Elements in HiCal Products

| Description | | Unit | Amount | Test Method |
|---|---|---|---|---|
| Mercury | Hg | mg/kg | <0.2 | Atomic Absorption Spectrometry (AAS) cold vapour generation |
| Antimony | Sb | mg/kg | <10 | |
| Arsenic | As | mg/kg | <50 | |
| Barium | Ba | mg/kg | <10 | |
| Beryllium | Be | mg/kg | <10 | |
| Cadmium | Cd | mg/kg | <10 | |
| Cobalt | Co | mg/kg | <50 | |
| Chromium | Cr | mg/kg | <150 | |
| Copper | Cu | mg/kg | <350 | Inductively Coupled Plasma Spectroscopy (ICP-OES) |
| Manganese | Mn | mg/kg | <1000 | |
| Nickel | Ni | mg/kg | <500 | |
| Lead | Pb | mg/kg | <100 | |
| Selenium | Se | mg/kg | <5 | |
| Tin | Sn | mg/kg | <20 | |
| Thallium | Tl | mg/kg | <5 | |
| Vanadium | V | mg/kg | <200 | |
| Zinc | Zn | mg/kg | <100 | |

## Grindability Index

HiCAl grindability index (measured as Hardgrove Grindability Index) is above 50.

## Overview

This Information Article has been prepared to inform regulatory stakeholders and Regain Customers on the source of the materials that Regain recovers from the aluminium smelting industry.

## Background

Regain has developed a range of products for use as fluxes[1] and mineralisers[2] in energy intensive industries such as cement manufacture and brick manufacture. Benefits include economic and environmental gain from reduced energy requirements and reduced greenhouse gas emission.

The new fluxing minerals are products manufactured using by-product materials sourced from the aluminium smelting industry. The aluminium smelting industry uses large quantities of alumina, carbon, sodium fluoride and silica refractory materials. The aluminium smelter by-product materials are cost effective source for these substances that can be beneficially used in other industries, particularly energy intensive industries that can benefit from the energy saving fluxing properties of fluorine and sodium.

The beneficial fluxing and mineralising properties of aluminium smelter by-products have been well known for many years. The use of such materials has been limited because of safety and environmental concerns about certain hazardous properties of by-product materials. Regain has developed technology to detoxify the aluminium smelter by-products removing the key safety and environmental hazards and making them safe to use with other materials in manufacturing high quality mineral products.

This program has been under way since 1997. The use of Regain products as cost effective fluxing and mineralising products for energy saving and greenhouse gas emission reduction has been well established industries such as cement and brick making.

## Production of Primary Aluminium

Aluminium metal is produced from two different sources:

- primary aluminium production from the smelting of alumina ($Al_2O_3$); and
- recycling aluminium from process scrap and used aluminium products.

This article addresses the materials recovered by Regain from primary aluminium production – aluminium smelting. It does not address the aluminium dross material from remelting aluminium metal for recycling.

Primary aluminium in produced from alumina, or aluminium oxide ($Al_2O_3$) in electrolytic reduction cells in aluminium smelters as shown opposite in Figure 1.

These smelters use large amounts of electrical energy and are typically located near low cost sources of electrical energy.

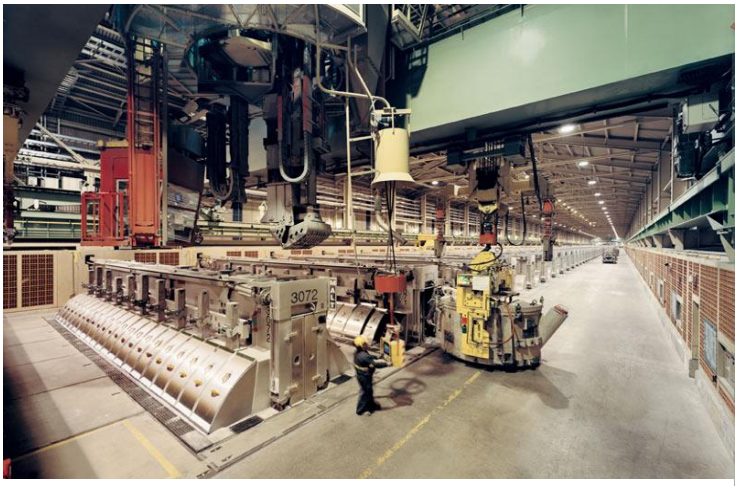

**Figure 1**
**Electrolytic Reduction Cells Inside a Modern Primary Aluminium Smelter**

[1] A flux is a substance that lowers the temperature at which solid materials enter a liquid phase and/or increases the quantity of liquid at a given temperature.
[2] A mineraliser is a substance that accelerates reaction rates promotes the formation of desired materials in the liquid phase of cement clinker or similar materials. This results in a higher quality product with less residence time and less energy for processes such as cement making.

## Aluminium Production Process

In 1886, Charles Hall of the USA and Paul L.T. Heroult of France, made the same discovery - molten cryolite (a sodium aluminium fluoride mineral) could be used to dissolve alumina and the resulting chemical reaction would produce metallic aluminium. An electrical current runs through the cryolite/alumina mixture to bring about the chemical reaction necessary to convert the alumina to metallic aluminium. The Hall-Heroult process remains in use today for the production of aluminium metal from alumina.

Production of primary aluminium metal with the Hall-Heroult process involves the electrolytic reduction of alumina in cells or pots. The electrolyte is made up of molten cryolite and other additives. The electrolyte is contained in a carbon and refractory lining in a steel potshell. A schematic view of an aluminium reduction cell is shown in Figure 2.

The cathode for the electrolytic process is a carbon lining made up of pre-formed carbon cathode blocks. Other carbon materials line the sides of the pot. Refractory materials generally sit between the carbon cathode and the steel potshell. Over time the effectiveness of the lining deteriorates and the lining of the pot is removed and then replaced with a new lining. The lining material that has been removed from the pot is recovered and processed by Regain.

The anode for the electrolytic process is a large carbon block held by a metal frame and suspended in the molten cryolite /alumina mixture. Most of the carbon anode block is consumed in the production process. When the carbon anode block is at the end of its service life it is removed and the remaining carbon is incorporated into new carbon anode blocks. A proportion of the anode carbon is not re-usable and this carbon is recovered and processed by Regain.

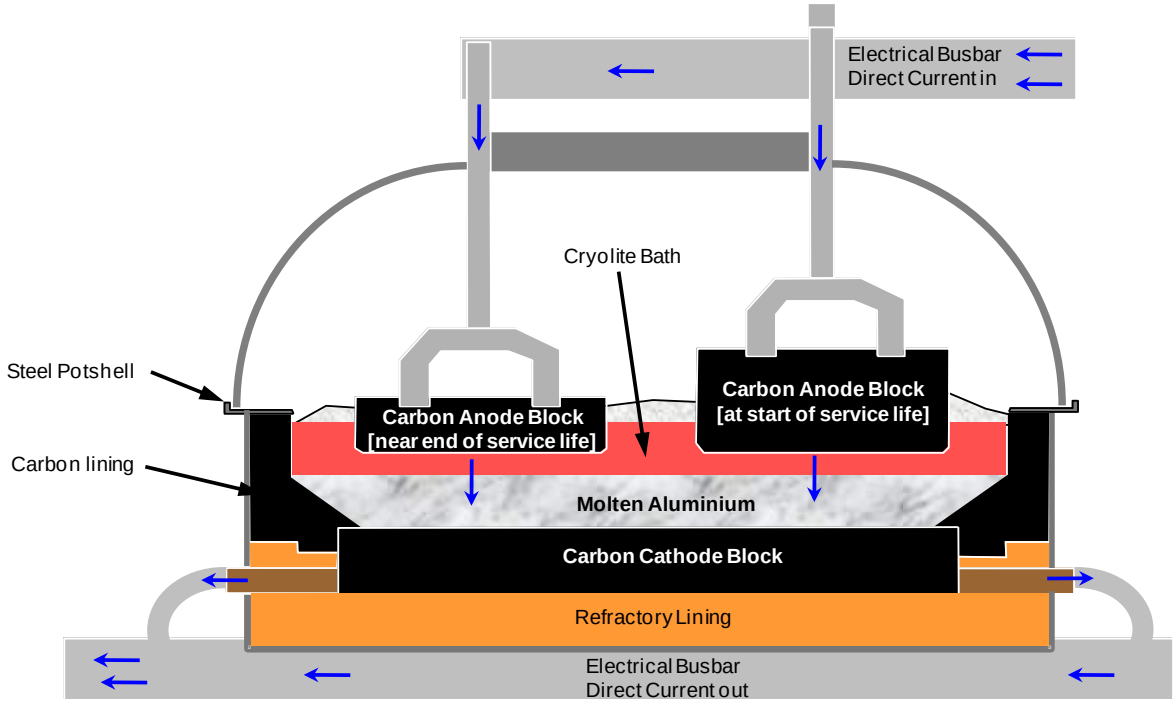

**Figure 2**
**Cross Section Schematic of Aluminium Reduction Cell (or Pot)**

Over the typical life of a pot (three to ten years), materials such as alumina, molten aluminium, calcium, fluorides and sodium infiltrate the cathode lining and cause it to deteriorate. The aluminium reduction cell process results in the formation of reactive compounds of carbon and nitrogen that can react with water and give off explosive gases. Also, the carbon-nitrogen compounds in the forms of cyanides may be hazardous to human beings and the environment.

## Description of By-product Materials for Recovery

Both the anode carbon and cell lining material, in the form that they are recovered from the aluminium smelting process, are variable, both in size and in chemical composition. The size varies from large lumps of more than 500kg in weight to fine dust.

Figure 3 shows a carbon anode block that is not usable in aluminium smelting and is available for recovery as a rich source of low cost carbon, sodium and fluorine.

Figures 4 and 5 show by-product materials ready for recovery.

**Figure 3 – Carbon Anode Block**

**Figure 4**
**Carbon Anode Material for Recovery**

**Figure 5**
**Cell Lining Material for Recovery**

During the aluminium reduction process, chemical reactions result in the formation of various carbides, nitrides and cyanide within the pot linings (e.g. refractory lining, carbon cathode, carbon sidewalls). Indicative examples of the chemical reactions are:

- metals such as aluminium react with nitrogen to form nitrides e.g. $2Al + N_2 \rightarrow Al_2N_2$
- metal oxides also react with carbon to form carbides e.g. $2Al_2O_3 + 9C \rightarrow Al_4C_3 + 6CO$
- various carbon-nitrogen compounds are also produced in the forms of cyanides, in both simple and complex forms.

When the linings are removed from the pot, the material contains aluminium metal, sodium metal, carbides, nitrides and cyanides. The removed lining material readily absorbs atmospheric water (humidity), which reacts with these components. Typical chemical reactions of metals or chemical compounds with water that produce explosive gases are:

- aluminium metal to hydrogen $2Al + 2OH + 2H_2O \rightarrow 2AlO_2^- + 3H_2$
- aluminium carbide to methane $Al_4C_3 + 12H_2O \rightarrow 4Al(OH)_3 + 3CH_4$
- calcium carbide to acetylene $CaC_2 + 2H_2O \rightarrow Ca(OH)_2 + C_2H_2$
- Aluminium nitride to ammonia $Al_2N_2 + 6H_2O \rightarrow 2Al(OH)_3 + 2NH_3$.

**Table 1 – Range of Chemical Composition of Materials for Recovery by Regain**

| | | | Anode Carbon Material | Carbon Cell Lining | Refractory Cell Lining |
|---|---|---|---|---|---|
| Carbon | | % | 45 to 80 | 30 to 50 | 2 to 7 |
| Silicon | as $SiO_2$ | % | 0 to 5 | 2 to 15 | 10 to 40 |
| Iron | as $Fe_2O_3$ | % | 2 to 10 | 2 to 4 | 1 to 6 |
| Aluminium | as $Al_2O_3$ | % | 10 to 25 | 10 to 30 | 15 to 30 |
| Titanium | as $TiO_2$ | % | 0 to 2 | 0 to 2 | 0 to 2 |
| Calcium | as CaO | % | 0 to 2 | 1 to 5 | 1 to 5 |
| Magnesium | as MgO | % | 0 to 1 | 0 to 2 | 0.5 to 2.5 |
| Sodium | as $Na_2O$ | % | 5 to 15 | 3 to 25 | 5 to 30 |
| Potassium | as $K_2O$ | % | 0 to 1 | 0.2 to 1 | 0.5 to 1.5 |
| Fluorine | Total | % | 5 to 15 | 5 to 15 | 5 to 15 |
| Cyanide | | mg/kg | | 100 to 4,000 | 100 to 1,500 |
| Fluoride – leachable | | mg/L | | 500 to 3,600 | 300 to 3,000 |
| Cyanide – leachable | | mg/L | 0 to 1 | 0.1 to 20 | 0.05 to 10 |

## Processing of By-product Materials

Certain materials recovered from the aluminium smelting process are hazardous because of –

- health and environmental hazards due to the presence of cyanide formed as a result of the reaction of nitrogen from air with the carbon pot lining
- reactive compounds, aluminium metal and sodium metal that may combine with water to give off flammable gases such methane and hydrogen which presents a potential explosion hazard.

The materials are potentially valuable because of –

- the calorific value of the carbon
- fluorides and sodium which act as fluxes and mineralisers
- minerals such as alumina and silica that are usable by other industries.

The hazards in the material are eliminated by Regain as part of the material recovery at the aluminium smelter site prior to shipment of material or products manufactured using the recovered materials. Figure 6 shows a typical Regain processing plant at an aluminium smelter.

**Figure 6**

## Hazard Elimination and Product Manufacturing Process

Elimination of the explosive gas and cyanide hazards requires a chemical processes and technology that can handle the highly variable properties of the by-product materials. An overview of the Regain process for refining the smelter by-products and manufacturing new products that are not classified as waste materials is shown in Figure 7.

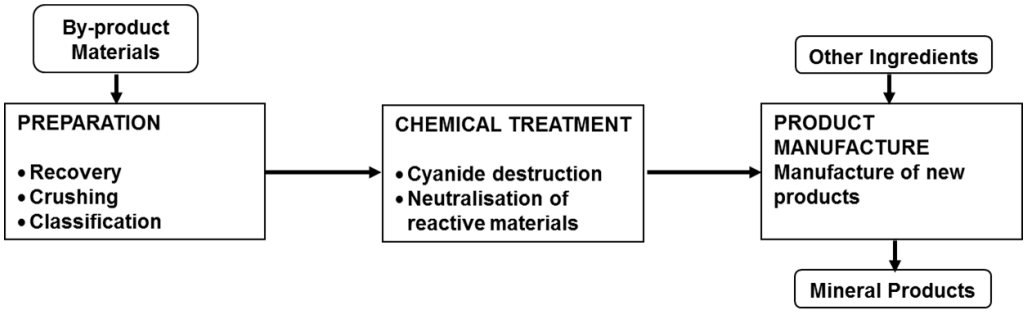

**Figure 7 – Mineral Products from Refined Aluminium Smelter By-products – Process Flow**

Preparation involves (a) recovery of material from storage or directly from pots, (b) primary segregation of aluminium metal, carbon materials and refractory materials, (c) sorting into like material streams and (d) crushing and size classification in preparation for further processing.

The cyanide and explosion hazards in the smelter by-products are eliminated through the Chemical Treatment process. Cyanide destruction is achieved by thermal oxidation i.e. heating the material in the presence of oxygen. Neutralisation of the reactive compounds and aluminium metal is achieved by using water to bring on the reactions that generate the explosive gases in a controlled environment in special apparatus such that no more gas can be generated. Indicative chemical reactions that take place in chemical treatment process are:

- Cyanide to carbon dioxide & nitrogen $C_2N_2 + 2O_2 \rightarrow 2\ CO_2 + N_2$
- Reaction with water, generating flammable gases as described on page 3
- Combustion of flammable and other gases - e.g.
  - hydrogen to water $2H_2 + O_2 \rightarrow 2H_20$
  - methane to carbon dioxide and water $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$
  - acetylene to carbon dioxide and water $2C_2H_2 + 5O_2 \rightarrow 4CO_2 + 2H_2O$.

The Regain treatment process ensures that:

- cyanide levels are below levels that can harm humans or the environment
- the reactive compounds in by-product materials are neutralised and no more gas can be generated.

Mineral products with fluxing and mineralising properties are manufactured by processing the treated by-product materials and other ingredients. Small amounts of fluorine and sodium can have a significant effect in cement clinker and clay brick manufacture. Realisation of the potential value in the chemicals and minerals in the smelter by-product materials requires high quality products with homogeneous properties manufactured to tight specifications. These products can then be dosed into cement clinker plants and clay brick plants in a way that delivers predictable and reliable beneficial effects on process chemistry and reliable production outcome

The Regain process for elimination of hazards in aluminium smelter by-products and the manufacture of consistent high quality products which are safe to transport and use is the subject of patents in Australia, Canada, New Zealand, South Africa, United Arab Emirates and the United States of America. Products have been accepted by regulators and customers in Australia, China, Ecuador, El Salvador, Philippines and Thailand.

## Properties of Products Manufactured Using By-product Materials

The following tables provide information on the chemical composition of typical fuel and energy saving products manufactured by Regain using by-product materials recovered from aluminium smelters. Table 2 provides analysis of the main chemical constituents of Regain products. A trace element analysis is set out in table 3. Table 4 shows typical mineralogy based on x-ray diffraction (XRD) analysis.

**Table 2 – Chemical Composition of Typical Cement Industry Products Manufactured by Regain**

| Description | | Unit | Cement Clinker Mineralisation Products | | | | Test Method |
|---|---|---|---|---|---|---|---|
| | | | HiCal-R | HiCal-S | HiCal 30 | HiCal 40 | |
| Carbon | | % | 2 to 7 | 4 to 9 | 30 to 35 | 40 to 45 | Liebig technique to Australian Standard AS2434.6 |
| Calorific Value | | Mj/kg | n.a. | n.a. | >9 | >12 | Calorimeter to Australian Standard AS1038.5 |
| Aluminium | as $Al_2O_3$ | % | 25 to 30 | 25 to 30 | 18 to 23 | 16 to 21 | Inductively Coupled Plasma Spectroscopy (ICP/OES) |
| Calcium | as CaO | % | 1 to 3 | 1 to 3 | 1 to 3 | 1 to 3 | |
| Iron | as $Fe_2O_3$ | % | 2 to 6 | 6 to 11 | 2 to 7 | 2 to 7 | |
| Potassium | as $K_2O$ | % | 0 to 2 | 0 to 2 | 0 to 1 | 0 to 1 | |
| Silicon | as $SiO_2$ | % | 30 to 37 | 12 to 18 | 11 to 17 | 6 to 12 | |
| Sodium | as $Na_2O$ | % | 18 to 23 | 24 to 29 | 15 to 20 | 14 to 19 | |
| Sulphur | as $SO_3$ | % | 0 to 2 | 0 to 2 | 0 to 2 | 0 to 2 | |
| Fluorine | total | % | 8 to 12 | 10 to 14 | 8 to 12 | 8 to 12 | Ion selective Electrode (ISE) |
| Cyanide | total | mg/kg | <60 | <60 | <60 | <60 | Spectrophotometry |

Note that product analysis may vary depending on customer requirements and the specific details of specification agreed with individual customers.

**Table 3 – Trace Element Analysis**

| Description | | Unit | Amount | Test Method |
|---|---|---|---|---|
| Mercury | Hg | mg/kg | <0.2 | Atomic Absorption Spectrometry (AAS) cold vapour generation |
| Antimony | Sb | mg/kg | <10 | Inductively Coupled Plasma Spectroscopy (ICP-OES) |
| Arsenic | As | mg/kg | <50 | |
| Barium | Ba | mg/kg | <10 | |
| Beryllium | Be | mg/kg | <10 | |
| Cadmium | Cd | mg/kg | <10 | |
| Cobalt | Co | mg/kg | <50 | |
| Chromium | Cr | mg/kg | <150 | |
| Copper | Cu | mg/kg | <350 | |
| Manganese | Mn | mg/kg | <1000 | |
| Nickel | Ni | mg/kg | <500 | |
| Lead | Pb | mg/kg | <100 | |
| Selenium | Se | mg/kg | <5 | |
| Tin | Sn | mg/kg | <20 | |
| Thallium | Tl | mg/kg | <5 | |
| Vanadium | V | mg/kg | <200 | |
| Zinc | Zn | mg/kg | <100 | |

## SECTION 1 IDENTIFICATION OF THE SUBSTANCE / MIXTURE AND OF THE COMPANY / UNDERTAKING

### Product Identifier

| | |
|---|---|
| **Product name** | Regain HiCal 30 |
| **Synonyms** | Not Available |
| **Other means of identification** | Not Available |

### Relevant identified uses of the substance or mixture and uses advised against

| | |
|---|---|
| **Relevant identified uses** | Used as a raw material in the manufacture of clinker. Used according to manufacturers directions. |

### Details of the supplier of the safety data sheet

| | |
|---|---|
| **Registered company name** | Regain Services |
| **Address** | G07-620 St. Kilda Road Melbourne VIC 3004 Australia |
| **Telephone** | +61 3 9514 8600 |
| **Fax** | +61 3 9514 8642 |
| **Website** | www.regain.com.au |
| **Email** | info@regain.com.au |

### Emergency telephone number

Not Applicable

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

### Substances

See section below for composition of Mixtures

### Mixtures

| CAS No | %[weight] | Name |
|---|---|---|
| 7440-44-0 | 30-35 | carbon, non-activated |
| 1344-28-1. | 17-22 | aluminium oxide |
| 7631-86-9 | 1-9 | silica amorphous |
| 1309-37-1 | 1-5 | ferric oxide |
| 1309-48-4. | <0.5 | magnesium oxide |
| 13463-67-7 | <0.2 | titanium dioxide |
| 7789-75-5 | 1-10 | calcium fluoride |

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Wash out immediately with fresh running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Seek medical attention without delay; if pain persists or recurs seek medical attention.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin contact occurs:<br>▸ Immediately remove all contaminated clothing, including footwear.<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If dust is inhaled, remove from contaminated area.<br>▸ Encourage patient to blow nose to ensure clear passage of breathing.<br>▸ If irritation or discomfort persists seek medical attention. |
| **Ingestion** | ▸ If swallowed do **NOT** induce vomiting.<br>▸ If vomiting occurs, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.<br>▸ Observe the patient carefully.<br>▸ Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious.<br>▸ Give water to rinse out mouth, then provide liquid slowly and as much as casualty can comfortably drink.<br>▸ Seek medical advice. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

|||
Foam.
Dry chemical powder.
BCF (where regulations permit).
Carbon dioxide.

### Special hazards arising from the substrate or mixture

**Continued...**

| | |
|---|---|
| **Fire Incompatibility** | ▸ Avoid reaction with oxidising agents |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | ▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ Wear breathing apparatus plus protective gloves.<br>▸ Prevent, by any means available, spillage from entering drains or water courses.<br>▸ Use water delivered as a fine spray to control fire and cool adjacent area.<br>▸ **DO NOT** approach containers suspected to be hot.<br>▸ Cool fire exposed containers with water spray from a protected location.<br>▸ If safe to do so, remove containers from path of fire.<br>▸ Equipment should be thoroughly decontaminated after use. |
| **Fire/Explosion Hazard** | Combustible<br>Decomposition may produce toxic fumes of:<br>carbon monoxide (CO)<br>carbon dioxide (CO2)<br>fluorides<br>Avoid creating dust - may present dust explosion hazard. Dry dust can be electrostatically charged by turbulence, pneumatic transport, pouring, in exhaust ducts and during transport. Build-up of electrostatic charge may be prevented by grounding. |
| **HAZCHEM** | Not Applicable |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

See section 8

### Environmental precautions

See section 12

### Methods and material for containment and cleaning up

| | |
|---|---|
| **Minor Spills** | ▸ Remove all ignition sources.<br>▸ Clean up all spills immediately.<br>▸ Avoid contact with skin and eyes.<br>▸ Control personal contact with the substance, by using protective equipment.<br>▸ Use dry clean up procedures and avoid generating dust.<br>▸ Place in a suitable, labelled container for waste disposal. |
| **Major Spills** | Remove all ignition sources.<br>▸ Clear area of personnel and move upwind.<br>▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ Control personal contact with the substance, by using protective equipment and dust respirator.<br>▸ Prevent spillage from entering drains, sewers or water courses.<br>▸ Recover product wherever possible. Avoid generating dust.<br>▸ Sweep / shovel up.<br>▸ If required, wet with water to prevent dusting.<br>▸ Put residues in labelled plastic bags or other containers for disposal.<br>▸ Wash area down with large quantity of water and prevent runoff into drains.<br>▸ If contamination of drains or waterways occurs, advise emergency services. |

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | Remove all ignition sources.<br>▸ Limit all unnecessary personal contact.<br>▸ Wear protective clothing when risk of exposure occurs.<br>▸ Use in a well-ventilated area.<br>▸ Avoid contact with incompatible materials.<br>▸ When handling, **DO NOT** eat, drink or smoke.<br>▸ Keep containers securely sealed when not in use.<br>▸ Avoid physical damage to containers.<br>▸ Always wash hands with soap and water after handling.<br>▸ Work clothes should be laundered separately.<br>▸ Use good occupational work practice.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS.<br>▸ Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions are maintained. |

**Continued...**

| | |
|---|---|
| **Other information** | ▸ Keep dry.<br>▸ Store under cover.<br>▸ Store in a well ventilated area.<br>▸ Store away from sources of heat or ignition.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS. |

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Check that containers are clearly labelled<br>▸ Packaging as recommended by manufacturer. |
| **Storage incompatibility** | Avoid storage with oxidisers |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

#### OCCUPATIONAL EXPOSURE LIMITS (OEL)

#### INGREDIENT DATA

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | carbon, non-activated | Fume (thermally generated) (respirable dust) | 2 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium oxide | Aluminium oxide | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica amorphous | Silica - Amorphous: Precipitated silica / Silica - Amorphous: Silica gel / Precipitated silica / Silica gel | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica amorphous | Silica - Amorphous: Diatomaceous earth (uncalcined) / Diatomaceous earth (uncalcined) | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica amorphous | Silica - Amorphous: Fume (thermally generated) (respirable dust) | 2 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica amorphous | Silica - Amorphous: Fumed silica (respirable dust) / Fumed silica (respirable dust) | 2 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | ferric oxide | Iron oxide fume (Fe2O3) (as Fe) | 5 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | magnesium oxide | Magnesium oxide (fume) | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | titanium dioxide | Titanium dioxide | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | calcium fluoride | Fluorides (as F) | 2.5 mg/m3 | Not Available | Not Available | Not Available |

#### EMERGENCY LIMITS

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| carbon, non-activated | Carbon; (Graphite, synthetic) | 6 mg/m3 | 16 mg/m3 | 95 mg/m3 |
| aluminium oxide | Aluminum oxide; (Alumina) | 5.7 mg/m3 | 15 mg/m3 | 25 mg/m3 |
| silica amorphous | Silica gel, amorphous synthetic | 18 mg/m3 | 200 mg/m3 | 1,200 mg/m3 |
| silica amorphous | Silica, amorphous fumed | 18 mg/m3 | 100 mg/m3 | 630 mg/m3 |
| silica amorphous | Siloxanes and silicones, dimethyl, reaction products with silica; (Hydrophobic silicon dioxide, amorphous) | 120 mg/m3 | 1,300 mg/m3 | 7,900 mg/m3 |
| silica amorphous | Silica, amorphous fume | 45 mg/m3 | 500 mg/m3 | 3,000 mg/m3 |
| silica amorphous | Silica amorphous hydrated | 18 mg/m3 | 220 mg/m3 | 1,300 mg/m3 |
| ferric oxide | Iron oxide; (Ferric oxide) | 15 mg/m3 | 360 mg/m3 | 2,200 mg/m3 |
| magnesium oxide | Magnesium oxide | 30 mg/m3 | 120 mg/m3 | 730 mg/m3 |
| titanium dioxide | Titanium oxide; (Titanium dioxide) | 30 mg/m3 | 330 mg/m3 | 2,000 mg/m3 |

**Continued...**

| | | | | |
|---|---|---|---|---|
| calcium fluoride | Calcium fluoride | 15 mg/m3 | 170 mg/m3 | 1,000 mg/m3 |

| Ingredient | Original IDLH | Revised IDLH |
|---|---|---|
| carbon, non-activated | Not Available | Not Available |
| aluminium oxide | Not Available | Not Available |
| silica amorphous | N.E. mg/m3 / N.E. ppm | 3,000 mg/m3 |
| ferric oxide | N.E. mg/m3 / N.E. ppm | 2,500 mg/m3 |
| magnesium oxide | N.E. mg/m3 / N.E. ppm | 750 mg/m3 |
| titanium dioxide | N.E. mg/m3 / N.E. ppm | 5,000 mg/m3 |
| calcium fluoride | 500 mg/m3 | 250 mg/m3 |

**MATERIAL DATA**

None assigned. Refer to individual constituents.

## Exposure controls

**Appropriate engineering controls**

Engineering controls are used to remove a hazard or place a barrier between the worker and the hazard. Well-designed engineering controls can be highly effective in protecting workers and will typically be independent of worker interactions to provide this high level of protection.
The basic types of engineering controls are:
Process controls which involve changing the way a job activity or process is done to reduce the risk.
Enclosure and/or isolation of emission source which keeps a selected hazard "physically" away from the worker and ventilation that strategically "adds" and "removes" air in the work environment. Ventilation can remove or dilute an air contaminant if designed properly. The design of a ventilation system must match the particular process and chemical or contaminant in use.
Employers may need to use multiple types of controls to prevent employee overexposure.

- Local exhaust ventilation is required where solids are handled as powders or crystals; even when particulates are relatively large, a certain proportion will be powdered by mutual friction.
- Exhaust ventilation should be designed to prevent accumulation and recirculation of particulates in the workplace.
- If in spite of local exhaust an adverse concentration of the substance in air could occur, respiratory protection should be considered. Such protection might consist of:

(a): particle dust respirators, if necessary, combined with an absorption cartridge;
(b): filter respirators with absorption cartridge or canister of the right type;
(c): fresh-air hoods or masks

- Build-up of electrostatic charge on the dust particle, may be prevented by bonding and grounding.
- Powder handling equipment such as dust collectors, dryers and mills may require additional protection measures such as explosion venting.

Air contaminants generated in the workplace possess varying "escape" velocities which, in turn, determine the "capture velocities" of fresh circulating air required to efficiently remove the contaminant.

| Type of Contaminant: | Air Speed: |
|---|---|
| direct spray, spray painting in shallow booths, drum filling, conveyer loading, crusher dusts, gas discharge (active generation into zone of rapid air motion) | 1-2.5 m/s (200-500 f/min.) |
| grinding, abrasive blasting, tumbling, high speed wheel generated dusts (released at high initial velocity into zone of very high rapid air motion). | 2.5-10 m/s (500-2000 f/min.) |

Within each range the appropriate value depends on:

| Lower end of the range | Upper end of the range |
|---|---|
| 1: Room air currents minimal or favourable to capture | 1: Disturbing room air currents |
| 2: Contaminants of low toxicity or of nuisance value only | 2: Contaminants of high toxicity |
| 3: Intermittent, low production. | 3: High production, heavy use |
| 4: Large hood or large air mass in motion | 4: Small hood-local control only |

Simple theory shows that air velocity falls rapidly with distance away from the opening of a simple extraction pipe. Velocity generally decreases with the square of distance from the extraction point (in simple cases). Therefore the air speed at the extraction point should be adjusted, accordingly, after reference to distance from the contaminating source. The air velocity at the extraction fan, for example, should be a minimum of 4-10 m/s (800-2000 f/min) for extraction of crusher dusts generated 2 metres distant from the extraction point. Other mechanical considerations, producing performance deficits within the extraction apparatus, make it essential that theoretical air velocities are multiplied by factors of 10 or more when extraction systems are installed or used.

**Continued...**

| | |
|---|---|
| **Personal protection** | |
| **Eye and face protection** | ▸ Safety glasses with side shields; or as required,<br>▸ Chemical goggles.<br>▸ Contact lenses may pose a special hazard; soft contact lenses may absorb and concentrate irritants. A written policy document, describing the wearing of lenses or restrictions on use, should be created for each workplace or task. This should include a review of lens absorption and adsorption for the class of chemicals in use and an account of injury experience. Medical and first-aid personnel should be trained in their removal and suitable equipment should be readily available. In the event of chemical exposure, begin eye irrigation immediately and remove contact lens as soon as practicable. Lens should be removed at the first signs of eye redness or irritation - lens should be removed in a clean environment only after workers have washed hands thoroughly. [CDC NIOSH Current Intelligence Bulletin 59], [AS/NZS 1336 or national equivalent] |
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | The selection of suitable gloves does not only depend on the material, but also on further marks of quality which vary from manufacturer to manufacturer. Where the chemical is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application.<br>The exact break through time for substances has to be obtained from the manufacturer of the protective gloves and.has to be observed when making a final choice.<br>Personal hygiene is a key element of effective hand care. Gloves must only be worn on clean hands. After using gloves, hands should be washed and dried thoroughly. Application of a non-perfumed moisturizer is recommended.<br>Suitability and durability of glove type is dependent on usage. Important factors in the selection of gloves include:<br>· frequency and duration of contact,<br>· chemical resistance of glove material,<br>· glove thickness and<br>· dexterity<br>Select gloves tested to a relevant standard (e.g. Europe EN 374, US F739, AS/NZS 2161.1 or national equivalent).<br>· When prolonged or frequently repeated contact may occur, a glove with a protection class of 5 or higher (breakthrough time greater than 240 minutes according to EN 374, AS/NZS 2161.10.1 or national equivalent) is recommended.<br>· When only brief contact is expected, a glove with a protection class of 3 or higher (breakthrough time greater than 60 minutes according to EN 374, AS/NZS 2161.10.1 or national equivalent) is recommended.<br>· Some glove polymer types are less affected by movement and this should be taken into account when considering gloves for long-term use.<br>· Contaminated gloves should be replaced.<br>For general applications, gloves with a thickness typically greater than 0.35 mm, are recommended.<br>It should be emphasised that glove thickness is not necessarily a good predictor of glove resistance to a specific chemical, as the permeation efficiency of the glove will be dependent on the exact composition of the glove material. Therefore, glove selection should also be based on consideration of the task requirements and knowledge of breakthrough times.<br>Glove thickness may also vary depending on the glove manufacturer, the glove type and the glove model. Therefore, the manufacturers' technical data should always be taken into account to ensure selection of the most appropriate glove for the task.<br>Note: Depending on the activity being conducted, gloves of varying thickness may be required for specific tasks. For example:<br>· Thinner gloves (down to 0.1 mm or less) may be required where a high degree of manual dexterity is needed. However, these gloves are only likely to give short duration protection and would normally be just for single use applications, then disposed of.<br>· Thicker gloves (up to 3 mm or more) may be required where there is a mechanical (as well as a chemical) risk i.e. where there is abrasion or puncture potential<br>Gloves must only be worn on clean hands. After using gloves, hands should be washed and dried thoroughly. Application of a non-perfumed moisturiser is recommended.<br>Wear safety footwear. |

## Respiratory protection

**Particulate. (AS/NZS 1716 & 1715, EN 143:000 & 149:001, ANSI Z88 or national equivalent)**

Where the concentration of gas/particulates in the breathing zone, approaches or exceeds the "Exposure Standard" (or ES), respiratory protection is required.
Degree of protection varies with both face-piece and Class of filter; the nature of protection varies with Type of filter.

| Required Minimum Protection Factor | Half-Face Respirator | Full-Face Respirator | Powered Air Respirator |
|---|---|---|---|
| up to 10 x ES | -AUS P2 | - | -PAPR-AUS / Class 1 P2 |
| up to 50 x ES | - | -AUS / Class 1 P2 | - |

**Continued...**

| | | | |
|---|---|---|---|
| up to 100 x ES | - | -2 P2 | -PAPR-2 P2 ^ |

^ - Full-face
A(All classes) = Organic vapours, B AUS or B1 = Acid gasses, B2 = Acid gas or hydrogen cyanide(HCN), B3 = Acid gas or hydrogen cyanide(HCN), E = Sulfur dioxide(SO2), G = Agricultural chemicals, K = Ammonia(NH3), Hg = Mercury, NO = Oxides of nitrogen, MB = Methyl bromide, AX = Low boiling point organic compounds(below 65 degC)

## SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

### Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Black divided solid, can emit ammonia odour.\|Slightly soluble in water. |

| | | | |

## SECTION 10 STABILITY AND REACTIVITY

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable.<br>▸ Hazardous polymerisation will not occur. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | The dust may be discomforting<br>Persons with impaired respiratory function, airway diseases and conditions such as emphysema or chronic bronchitis, may incur further disability if excessive concentrations of particulate are inhaled.<br>If prior damage to the circulatory or nervous systems has occurred or if kidney damage has been sustained, proper screenings should be conducted on individuals who may be exposed to further risk if handling and use of the material result in excessive exposures. |

**Continued...**

| | |
|---|---|
| | Acute effects of fluoride inhalation include irritation of nose and throat, coughing and chest discomfort.<br>Even brief exposure to high concentrations of inorganic fluoride may cause sore throat, chest pains, pulmonary oedema,and in rare cases irreparable damage to the lungs, and death<br>A single acute over-exposure may cause nose bleed. Pre-existing respiratory conditions such as emphysema, bronchitis may be aggravated by exposure. Occupational asthma may result from exposure. |
| **Ingestion** | The material has **NOT** been classified by EC Directives or other classification systems as "harmful by ingestion". This is because of the lack of corroborating animal or human evidence. The material may still be damaging to the health of the individual, following ingestion, especially where pre-existing organ (e.g liver, kidney) damage is evident. Present definitions of harmful or toxic substances are generally based on doses producing mortality rather than those producing morbidity (disease, ill-health). Gastrointestinal tract discomfort may produce nausea and vomiting. In an occupational setting however, ingestion of insignificant quantities is not thought to be cause for concern. |
| **Skin Contact** | The material may cause skin irritation after prolonged or repeated exposure and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterised by skin redness (erythema) and swelling epidermis. Histologically there may be intercellular oedema of the spongy layer (spongiosis) and intracellular oedema of the epidermis. |
| **Eye** | The material may be irritating to the eye, with prolonged contact causing inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis. |
| **Chronic** | Principal routes of exposure are by accidental skin and eye contact and inhalation of generated dusts.<br><br>Long term exposure to high dust concentrations may cause changes in lung function (i.e. pneumoconiosis) caused by particles less than 0.5 micron penetrating and remaining in the lung. A prime symptom is breathlessness. Lung shadows show on X-ray. |

|---|---|
| **CARBON, NON-ACTIVATED** | Substance has been investigated as a reproductive effector. |

**Continued...**

| | |
|---|---|
| **ALUMINIUM OXIDE** | No significant acute toxicological data identified in literature search. |
| **SILICA AMORPHOUS** | For silica amorphous:<br>When experimental animals inhale synthetic amorphous silica (SAS) dust, it dissolves in the lung fluid and is rapidly eliminated. If swallowed, the vast majority of SAS is excreted in the faeces and there is little accumulation in the body. Following absorption across the gut, SAS is eliminated via urine without modification in animals and humans. SAS is not expected to be broken down (metabolised) in mammals.<br>After ingestion, there is limited accumulation of SAS in body tissues and rapid elimination occurs. Intestinal absorption has not been calculated, but appears to be insignificant in animals and humans. SASs injected subcutaneously are subjected to rapid dissolution and removal. There is no indication of metabolism of SAS in animals or humans based on chemical structure and available data. In contrast to crystalline silica, SAS is soluble in physiological media and the soluble chemical species that are formed are eliminated via the urinary tract without modification.<br>Both the mammalian and environmental toxicology of SASs are significantly influenced by the physical and chemical properties, particularly those of solubility and particle size. SAS has no acute intrinsic toxicity by inhalation. Adverse effects, including suffocation, that have been reported were caused by the presence of high numbers of respirable particles generated to meet the required test atmosphere. These results are not representative of exposure to commercial SASs and should not be used for human risk assessment. Though repeated exposure of the skin may cause dryness and cracking, SAS is not a skin or eye irritant, and it is not a sensitiser.<br>Repeated-dose and chronic toxicity studies confirm the absence of toxicity when SAS is swallowed or upon skin contact. Long-term inhalation of SAS caused some adverse effects in animals (increases in lung inflammation, cell injury and lung collagen content), all of which subsided after exposure.<br>Numerous repeated-dose, subchronic and chronic inhalation toxicity studies have been conducted with SAS in a number of species, at airborne concentrations ranging from 0.5 mg/m3 to 150 mg/m3. Lowest-observed adverse effect levels (LOAELs) were typically in the range of 1 to 50 mg/m3. When available, the no-observed adverse effect levels (NOAELs) were between 0.5 and 10 mg/m3. The difference in values may be explained by different particle size, and therefore the number of particles administered per unit dose. In general, as particle size decreases so does the NOAEL/LOAEL.<br>Neither inhalation nor oral administration caused neoplasms (tumours). SAS is not mutagenic in vitro. No genotoxicity was detected in in vivo assays. SAS does not impair development of the foetus. Fertility was not specifically studied, but the reproductive organs in long-term studies were not affected.<br>In humans, SAS is essentially non-toxic by mouth, skin or eyes, and by inhalation. Epidemiology studies show little evidence of adverse health effects due to SAS. Repeated exposure (without personal protection) may cause mechanical irritation of the eye and drying/cracking of the skin.<br>There is no evidence of cancer or other long-term respiratory health effects (for example, silicosis) in workers employed in the manufacture of SAS. Respiratory symptoms in SAS workers have been shown to correlate with smoking but not with SAS exposure, while serial pulmonary function values and chest radiographs are not adversely affected by long-term exposure to SAS.<br>The substance is classified by IARC as Group 3:<br>**NOT** classifiable as to its carcinogenicity to humans.<br>Evidence of carcinogenicity may be inadequate or limited in animal testing.<br>Reports indicate high/prolonged exposures to amorphous silicas induced lung fibrosis in experimental animals; in some experiments these effects were reversible. [PATTYS] |
| **MAGNESIUM OXIDE** | The following information refers to contact allergens as a group and may not be specific to this product.<br>Contact allergies quickly manifest themselves as contact eczema, more rarely as urticaria or Quincke's oedema. The pathogenesis of contact eczema involves a cell-mediated (T lymphocytes) immune reaction of the delayed type. Other allergic skin reactions, e.g. contact urticaria, involve antibody-mediated immune reactions. The significance of the contact allergen is not simply determined by its sensitisation potential: the distribution of the substance and the opportunities for contact with it are equally important. A weakly sensitising substance which is widely distributed can be a more important allergen than one with stronger sensitising potential with which few individuals come into contact. From a clinical point of view, substances are noteworthy if they produce an allergic test reaction in more than 1% of the persons tested. |
| **TITANIUM DIOXIDE** | The material may produce moderate eye irritation leading to inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The material may cause skin irritation after prolonged or repeated exposure and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterised by skin redness (erythema) and swelling epidermis. Histologically there may be intercellular oedema of the spongy layer (spongiosis) and intracellular oedema of the epidermis.<br>For titanium dioxide:<br>Humans can be exposed to titanium dioxide via inhalation, ingestion or dermal contact. In human lungs, the clearance kinetics of titanium dioxide is poorly characterized relative to that in experimental animals. (General particle characteristics and host factors that are considered to affect deposition and retention patterns of inhaled, poorly soluble particles such as titanium dioxide are summarized in the monograph on carbon black.) With regard to inhaled titanium dioxide, human data are mainly available from case reports that showed deposits of titanium dioxide in lung tissue as well as in lymph nodes. A single clinical study of oral ingestion of fine titanium dioxide showed particle size-dependent absorption by the gastrointestinal tract and large interindividual variations in blood levels of titanium dioxide. Studies on the application of sunscreens containing ultrafine titanium dioxide to healthy skin of human volunteers revealed that titanium dioxide particles only penetrate into the outermost layers of the stratum corneum, suggesting that healthy skin is an effective barrier to titanium dioxide. There are no studies on penetration of titanium dioxide in compromised skin.<br>Respiratory effects that have been observed among groups of titanium dioxide-exposed workers include decline in lung function, pleural disease with plaques and pleural thickening, and mild fibrotic changes. However, the workers in these studies were also exposed to asbestos and/or silica.<br>No data were available on genotoxic effects in titanium dioxide-exposed humans.<br>Many data on deposition, retention and clearance of titanium dioxide in experimental animals are available for the inhalation route. Titanium dioxide inhalation studies showed differences — both for normalized pulmonary burden (deposited mass per dry lung, mass per body weight) and clearance kinetics — among rodent species including rats of different size, age and |

**Continued...**

| | |
|---|---|
| | strain. Clearance of titanium dioxide is also affected by pre-exposure to gaseous pollutants or co-exposure to cytotoxic aerosols. Differences in dose rate or clearance kinetics and the appearance of focal areas of high particle burden have been implicated in the higher toxic and inflammatory lung responses to intratracheally instilled vs inhaled titanium dioxide particles. Experimental studies with titanium dioxide have demonstrated that rodents experience dose-dependent impairment of alveolar macrophage-mediated clearance. Hamsters have the most efficient clearance of inhaled titanium dioxide. Ultrafine primary particles of titanium dioxide are more slowly cleared than their fine counterparts.<br>Titanium dioxide causes varying degrees of inflammation and associated pulmonary effects including lung epithelial cell injury, cholesterol granulomas and fibrosis. Rodents experience stronger pulmonary effects after exposure to ultrafine titanium dioxide particles compared with fine particles on a mass basis. These differences are related to lung burden in terms of particle surface area, and are considered to result from impaired phagocytosis and sequestration of ultrafine particles into the interstitium.<br>Fine titanium dioxide particles show minimal cytotoxicity to and inflammatory/pro-fibrotic mediator release from primary human alveolar macrophages in vitro compared with other particles. Ultrafine titanium dioxide particles inhibit phagocytosis of alveolar macrophages in vitro at mass dose concentrations at which this effect does not occur with fine titanium dioxide.<br>In-vitro studies with fine and ultrafine titanium dioxide and purified DNA show induction of DNA damage that is suggestive of the generation of reactive oxygen species by both particle types. This effect is stronger for ultrafine than for fine titanium oxide, and is markedly enhanced by exposure to simulated sunlight/ultraviolet light.<br>**Animal carcinogenicity data**<br>Pigmentary and ultrafine titanium dioxide were tested for carcinogenicity by oral administration in mice and rats, by inhalation in rats and female mice, by intratracheal administration in hamsters and female rats and mice, by subcutaneous injection in rats and by intraperitoneal administration in male mice and female rats.<br>In one inhalation study, the incidence of benign and malignant lung tumours was increased in female rats. In another inhalation study, the incidences of lung adenomas were increased in the high-dose groups of male and female rats. Cystic keratinizing lesions that were diagnosed as squamous-cell carcinomas but re-evaluated as non-neoplastic pulmonary keratinizing cysts were also observed in the high-dose groups of female rats. Two inhalation studies in rats and one in female mice were negative.<br>Intratracheally instilled female rats showed an increased incidence of both benign and malignant lung tumours following treatment with two types of titanium dioxide. Tumour incidence was not increased in intratracheally instilled hamsters and female mice.<br>In-vivo studies have shown enhanced micronucleus formation in bone marrow and peripheral blood lymphocytes of intraperitoneally instilled mice. Increased Hprt mutations were seen in lung epithelial cells isolated from titanium dioxide-instilled rats. In another study, no enhanced oxidative DNA damage was observed in lung tissues of rats that were intratracheally instilled with titanium dioxide. The results of most in-vitro genotoxicity studies with titanium dioxide were negative.<br><br>**WARNING:** This substance has been classified by the IARC as Group 2B: Possibly Carcinogenic to Humans.<br>* IUCLID |
| **FERRIC OXIDE & MAGNESIUM OXIDE & CALCIUM FLUORIDE** | Asthma-like symptoms may continue for months or even years after exposure to the material ceases. This may be due to a non-allergenic condition known as reactive airways dysfunction syndrome (RADS) which can occur following exposure to high levels of highly irritating compound. Key criteria for the diagnosis of RADS include the absence of preceding respiratory disease, in a non-atopic individual, with abrupt onset of persistent asthma-like symptoms within minutes to hours of a documented exposure to the irritant. A reversible airflow pattern, on spirometry, with the presence of moderate to severe bronchial hyperreactivity on methacholine challenge testing and the lack of minimal lymphocytic inflammation, without eosinophilia, have also been included in the criteria for diagnosis of RADS. RADS (or asthma) following an irritating inhalation is an infrequent disorder with rates related to the concentration of and duration of exposure to the irritating substance.<br>Industrial bronchitis, on the other hand, is a disorder that occurs as result of exposure due to high concentrations of irritating substance (often particulate in nature) and is completely reversible after exposure ceases. The disorder is characterised by dyspnea, cough and mucus production. |

| calcium fluoride | 7789-75-5, 14542-23-5 |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.
A list of reference resources used to assist the committee may be found at:
www.chemwatch.net
The SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings. Risks may be determined by reference to Exposures Scenarios. Scale of use, frequency of use and current or available engineering controls must be considered.

### Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。
IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection

Material Safety Data Sheet according to NOHSC and ADG requirements

Issue Date: **29/10/2015**
Print Date: **29/10/2015**
S.Local.AUS.EN

## SECTION 1 IDENTIFICATION OF THE SUBSTANCE / MIXTURE AND OF THE COMPANY / UNDERTAKING

### Product Identifier

| | |
|---|---|
| **Product name** | Regain HiCal-R |
| **Other means of identification** | Not Available |

### Relevant identified uses of the substance or mixture and uses advised against

| | |
|---|---|
| **Relevant identified uses** | Used as a raw material in manufacture of clinker. |

### Details of the supplier of the safety data sheet

| | |
|---|---|
| **Registered company name** | Regain Services |
| **Address** | G07-620 St. Kilda Road Melbourne 3004 VIC Australia |
| **Telephone** | +61 3 9514 8600 |
| **Fax** | +61 3 9514 8642 |
| **Website** | www.regain.com.au |
| **Email** | info@regain.com.au |

### Emergency telephone number

| | |
|---|---|
| **Association / Organisation** | Not Available |
| **Emergency telephone numbers** | +61 3 9514 8600 |
| **Other emergency telephone numbers** | +61 417 556 831 |

## SECTION 2 HAZARDS IDENTIFICATION

### Classification of the substance or mixture

**HAZARDOUS SUBSTANCE. NON-DANGEROUS GOODS. According to the Criteria of NOHSC, and the ADG Code.**

| | |
|---|---|
| **Poisons Schedule** | S6 |
| **Risk Phrases [1]** | **R20** Harmful by inhalation.<br>**R48/20** Harmful: danger of serious damage to health by prolonged exposure through inhalation. |
| ***Legend:*** | *1. Classified by Chemwatch; 2. Classification drawn from HSIS ; 3. Classification drawn from EC Directive 1272/2008 - Annex VI* |

Relevant risk statements are found in section 2

| | |
|---|---|
| **Indication(s) of danger** | Xn |

**SAFETY ADVICE**

| | |
|---|---|
| **S02** | Keep out of reach of children. |
| **S13** | Keep away from food, drink and animal feeding stuffs. |
| **S22** | Do not breathe dust. |
| **S281** | After contact with skin, wash immediately with detergent and plenty of water. |
| **S35** | This material and its container must be disposed of in a safe way. |
| **S36** | Wear suitable protective clothing. |
| **S38** | In case of insufficient ventilation, wear suitable respiratory equipment. |
| **S40** | To clean the floor and all objects contaminated by this material, use water and detergent. |
| **S45** | In case of accident or if you feel unwell IMMEDIATELY contact Doctor or Poisons Information Centre (show label if possible). |
| **S46** | If swallowed, seek medical advice immediately and show this container or label. |

**Continued...**

| | |
|---|---|
| **S56** | Dispose of this material and its container at hazardous or special waste collection point. |

### Other hazards

Ingestion may produce health damage*.

Cumulative effects may result following exposure*.

May produce discomfort of the eyes and skin*.

Limited evidence of a carcinogenic effect*.

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

### Substances

See section below for composition of Mixtures

### Mixtures

| CAS No | %[weight] | Name |
|---|---|---|
| 87347-84-0 | 20-40 | silica crystalline - quartz |
| 1344-28-1. | 10-30 | aluminium oxide |
| Not Available | NotSpec. | fluorine in the form |
| 17099-70-6 | 1-9 | aluminium fluorosilicate |
| 1309-37-1 | 1-5 | ferric oxide |
| 1309-48-4. | <1 | magnesium oxide |
| 98084-96-9 | <1 | titanium dioxide |

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Wash out immediately with fresh running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Seek medical attention without delay; if pain persists or recurs seek medical attention.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin or hair contact occurs:<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If dust is inhaled, remove from contaminated area.<br>▸ Encourage patient to blow nose to ensure clear passage of breathing.<br>▸ If irritation or discomfort persists seek medical attention. |
| **Ingestion** | ▸ If swallowed do **NOT** induce vomiting.<br>▸ If vomiting occurs, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.<br>▸ Observe the patient carefully.<br>▸ Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious.<br>▸ Give water to rinse out mouth, then provide liquid slowly and as much as casualty can comfortably drink.<br>▸ Seek medical advice. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

▸ There is no restriction on the type of extinguisher which may be used.
▸ Use extinguishing media suitable for surrounding area.

### Special hazards arising from the substrate or mixture

| | |
|---|---|
| **Fire Incompatibility** | None known |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | Alert Fire Brigade and tell them location and nature of hazard.<br>Use fire fighting procedures suitable for surrounding area.<br>Product is not combustible. No special firefighting procedures required. |
| **Fire/Explosion Hazard** | ▸ Non combustible.<br>▸ Not considered a significant fire risk, however containers may burn. |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

| | |
|---|---|
| **Minor Spills** | ▸ Clean up all spills immediately.<br>▸ Avoid contact with skin and eyes. |

**Continued...**

| | |
|---|---|
| | ▸ Wear protective clothing, gloves, safety glasses and dust respirator.<br>▸ Use dry clean up procedures and avoid generating dust.<br>▸ Sweep up or<br>▸ Vacuum up (consider explosion-proof machines designed to be grounded during storage and use).<br>▸ Place in clean drum then flush area with water. |
| **Major Spills** | ▸ Clear area of personnel and move upwind.<br>▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ Control personal contact with the substance, by using protective equipment and dust respirator.<br>▸ Prevent spillage from entering drains, sewers or water courses.<br>▸ Recover product wherever possible. Avoid generating dust.<br>▸ Sweep / shovel up. |

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | ▸ Limit all unnecessary personal contact.<br>▸ Wear protective clothing when risk of exposure occurs.<br>▸ Use in a well-ventilated area.<br>▸ Avoid contact with incompatible materials.<br>▸ When handling, **DO NOT** eat, drink or smoke.<br>▸ Keep containers securely sealed when not in use.<br>▸ Avoid physical damage to containers. |
| **Other information** | ▸ Keep dry.<br>▸ Store under cover.<br>▸ Protect containers against physical damage.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS. |

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Check that containers are clearly labelled<br>▸ Packaging as recommended by manufacturer. |
| **Storage incompatibility** | Segregate from<br>acids and<br>hydrogen fluoride |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

**OCCUPATIONAL EXPOSURE LIMITS (OEL)**

**INGREDIENT DATA**

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | silica crystalline - quartz | Silica - Crystalline Quartz (respirable dust) / Quartz (respirable dust) | 0.1 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium oxide | a-Alumina (Al2O3) / Aluminium oxide | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium fluorosilicate | Aluminium, soluble salts (as Al) | 2 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | ferric oxide | Iron oxide fume (Fe2O3) (as Fe) | 5 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | magnesium oxide | Magnesium oxide (fume) | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | titanium dioxide | Titanium dioxide | 10 mg/m3 | Not Available | Not Available | Not Available |

**EMERGENCY LIMITS**

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| silica crystalline - quartz | Silica, crystalline-quartz; (Silicon dioxide) | 0.025 mg/m3 | 0.025 mg/m3 | 0.025 mg/m3 |
| aluminium oxide | Aluminum oxide; (Alumina) | 1.5 mg/m3 | 15 mg/m3 | 25 mg/m3 |
| aluminium fluorosilicate | Aluminum hexafluorosilicate | 11 mg/m3 | 120 mg/m3 | 700 mg/m3 |
| ferric oxide | Iron oxide; (Ferric oxide) | 15 mg/m3 | 360 mg/m3 | 2200 mg/m3 |
| magnesium oxide | Magnesium oxide | 22 mg/m3 | 22 mg/m3 | 130 mg/m3 |
| titanium dioxide | Titanium oxide; (Titanium dioxide) | 10 mg/m3 | 10 mg/m3 | 10 mg/m3 |

| Ingredient | Original IDLH | Revised IDLH |
|---|---|---|

**Continued...**

| | | |
|---|---|---|
| silica crystalline - quartz | N.E. mg/m3 / N.E. ppm | 50 mg/m3 |
| aluminium oxide | Not Available | Not Available |
| fluorine in the form | Not Available | Not Available |
| aluminium fluorosilicate | 500 mg/m3 | 250 mg/m3 |
| ferric oxide | N.E. mg/m3 / N.E. ppm | 2,500 mg/m3 |
| magnesium oxide | N.E. mg/m3 / N.E. ppm | 750 mg/m3 |
| titanium dioxide | N.E. mg/m3 / N.E. ppm | 5,000 mg/m3 |

### Exposure controls

| | |
|---|---|
| **Appropriate engineering controls** | Use in a well-ventilated area<br>Engineering controls are used to remove a hazard or place a barrier between the worker and the hazard. Well-designed engineering controls can be highly effective in protecting workers and will typically be independent of worker interactions to provide this high level of protection.<br>The basic types of engineering controls are:<br>Process controls which involve changing the way a job activity or process is done to reduce the risk.<br>Enclosure and/or isolation of emission source which keeps a selected hazard "physically" away from the worker and ventilation that strategically "adds" and "removes" air in the work environment. Ventilation can remove or dilute an air contaminant if designed properly. The design of a ventilation system must match the particular process and chemical or contaminant in use.<br>Employers may need to use multiple types of controls to prevent employee overexposure.<br>In confined spaces where there is inadequate ventilation, wear full-face air supplied breathing apparatus |
| **Personal protection** | |
| **Eye and face protection** | ▸ Safety glasses with side shields; or as required,<br>▸ Chemical goggles.<br>▸ Contact lenses may pose a special hazard; soft contact lenses may absorb and concentrate irritants. A written policy document, describing the wearing of lenses or restrictions on use, should be created for each workplace or task. This should include a review of lens absorption and adsorption for the class of chemicals in use and an account of injury experience. Medical and first-aid personnel should be trained in their removal and suitable equipment should be readily available. In the event of chemical exposure, begin eye irrigation immediately and remove contact lens as soon as practicable. Lens should be removed at the first signs of eye redness or irritation - lens should be removed in a clean environment only after workers have washed hands thoroughly. |
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | Wear general protective gloves: i.e. Disposable polythene gloves or Cotton gloves or Light weight rubber gloves, with Barrier cream preferably Safety footwear. |
| **Body protection** | See Other protection below |
| **Other protection** | ▸ Overalls.<br>▸ Eyewash unit. |
| **Thermal hazards** | Not Available |

### Respiratory protection

Particulate. (AS/NZS 1716 & 1715, EN 143:000 & 149:001, ANSI Z88 or national equivalent)

## SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

### Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Odourless grey aggregate ranging in size up to 20mm. Slightly soluble in water. Very slightly soluble in strong alkali. |

| | | | |
|---|---|---|---|
| **Physical state** | divided | **Relative density (Water = 1)** | 3.0-3.2 |
| **Odour** | Not Available | **Partition coefficient n-octanol / water** | Not Available |
| **Odour threshold** | Not Available | **Auto-ignition temperature (°C)** | Not Applicable |
| **pH (as supplied)** | Not Applicable | **Decomposition temperature** | Not available. |
| **Melting point / freezing point (°C)** | >1400 | **Viscosity (cSt)** | Not Applicable |
| **Initial boiling point and boiling range (°C)** | Not Available | **Molecular weight (g/mol)** | Not Available |
| **Flash point (°C)** | Not Applicable | **Taste** | Not Available |
| **Evaporation rate** | Not Applicable | **Explosive properties** | Not Available |
| **Flammability** | Not Applicable | **Oxidising properties** | Not Available |
| **Upper Explosive Limit (%)** | Not Applicable | **Surface Tension (dyn/cm or mN/m)** | Not Available |
| **Lower Explosive Limit (%)** | Not Applicable | **Volatile Component (%vol)** | Not Applicable |
| **Vapour pressure (kPa)** | Not Applicable | **Gas group** | Not Available |
| **Solubility in water (g/L)** | Partly Miscible | **pH as a solution (1%)** | Not Applicable |
| **Vapour density (Air = 1)** | Not Applicable | **VOC g/L** | Not Available |

## SECTION 10 STABILITY AND REACTIVITY

**Continued...**

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable.<br>▸ Hazardous polymerisation will not occur. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | The dust may be discomforting<br>Persons with impaired respiratory function, airway diseases and conditions such as emphysema or chronic bronchitis, may incur further disability if excessive concentrations of particulate are inhaled.<br>If prior damage to the circulatory or nervous systems has occurred or if kidney damage has been sustained, proper screenings should be conducted on individuals who may be exposed to further risk if handling and use of the material result<br>in excessive exposures.<br><br>Effects on lungs are significantly enhanced in the presence of respirable particles. |
| **Ingestion** | Accidental ingestion of the material may be damaging to the health of the individual.<br>Ingestion may result in nausea, abdominal irritation, pain and vomiting |
| **Skin Contact** | There is some evidence to suggest that this material can cause inflammation of the skin on contact in some persons. |
| **Eye** | The dust may produce eye discomfort and abrasive eye inflammation. |
| **Chronic** | Principal routes of exposure are by accidental skin and eye contact and inhalation of generated dusts.<br>Long term exposure to high dust concentrations may cause changes in lung function i.e. pneumoconiosis; caused by particles less than 0.5 micron penetrating and remaining in the lung.<br>Crystalline silicas activate the inflammatory response of white blood cells after they injure the lung epithelium. Chronic exposure to crystalline silicas reduces lung capacity and predisposes to chest infections. |

| | TOXICITY | IRRITATION |
|---|---|---|
| **Regain HiCal-R** | Not Available | Not Available |
| **silica crystalline - quartz** | Not Available | Nil reported |
| **aluminium oxide** | Oral (rat) LD50: >2000 mg/kg[1] | Not Available |
| **fluorine in the form** | Not Available | Not Available |
| **aluminium fluorosilicate** | Not Available | Not Available |
| **ferric oxide** | Oral (rat) LD50: >5000 mg/kg[1] | Not Available |
| **magnesium oxide** | Not Available | Nil reported |
| **titanium dioxide** | Inhalation (rat) LC50: >2.28 mg/l4 h[1] | Skin (human): 0.3 mg /3D (int)-mild * |
| | Inhalation (rat) LC50: >3.56 mg/l4 h[1] | |
| | Inhalation (rat) LC50: >6.82 mg/l4 h[1] | |
| | Inhalation (rat) LC50: 3.43 mg/l4 h[1] | |
| | Inhalation (rat) LC50: 5.09 mg/l4 h[1] | |
| | Oral (rat) LD50: >2000 mg/kg[1] | |
| ***Legend:*** | *1. Value obtained from Europe ECHA Registered Substances - Acute toxicity 2.* Value obtained from manufacturer's SDS. Unless otherwise specified data extracted from RTECS - Register of Toxic Effect of chemical Substances* | |

| | | | |
|---|---|---|---|

| **Mutagenicity** | ⊘ | **Aspiration Hazard** | ⊘ |

*Legend:* ✘ *– Data available but does not fill the criteria for classification*
✔ *– Data required to make classification available*
⊘ *– Data Not Available to make classification*

## SECTION 12 ECOLOGICAL INFORMATION

### Toxicity

| Ingredient | Endpoint | Test Duration | Species | Value | Source |
|---|---|---|---|---|---|
| aluminium oxide | LC50 | 96 | Fish | 0.0780.108mg/L | 2 |
| aluminium oxide | EC50 | 48 | Crustacea | 1.5mg/L | 2 |
| aluminium oxide | EC50 | 96 | Algae or other aquatic plants | 0.024mg/L | 2 |
| ferric oxide | LC50 | 96 | Fish | 0.05mg/L | 2 |
| ferric oxide | EC50 | 48 | Crustacea | 5.11mg/L | 2 |
| ferric oxide | EC50 | 72 | Algae or other aquatic plants | 18mg/L | 2 |
| titanium dioxide | LC50 | 96 | Fish | >100mg/L | 2 |
| titanium dioxide | EC50 | 48 | Crustacea | >100mg/L | 2 |
| titanium dioxide | EC50 | 72 | Algae or other aquatic plants | 13mg/L | 2 |
| titanium dioxide | LC50 | 96 | Fish | 8.2mg/L | 2 |
| titanium dioxide | EC50 | 48 | Crustacea | >=100mg/L | 2 |
| titanium dioxide | EC50 | 72 | Algae or other aquatic plants | 5.83mg/L | 4 |
| titanium dioxide | EC0 | 720 | Crustacea | 3mg/L | 1 |
| titanium dioxide | EC100 | 720 | Crustacea | 500mg/L | 1 |
| titanium dioxide | EC20 | 72 | Algae or other aquatic plants | 1.81mg/L | 4 |

**DO NOT** discharge into sewer or waterways.

### Persistence and degradability

| Ingredient | Persistence: Water/Soil | Persistence: Air |
|---|---|---|
| titanium dioxide | HIGH | HIGH |

### Bioaccumulative potential

| Ingredient | Bioaccumulation |
|---|---|
| titanium dioxide | LOW (BCF = 10) |

### Mobility in soil

| Ingredient | Mobility |
|---|---|
| titanium dioxide | LOW (KOC = 23.74) |

## SECTION 13 DISPOSAL CONSIDERATIONS

### Waste treatment methods

| | |
|---|---|
| **Product / Packaging disposal** | ▸ Recycle wherever possible or consult manufacturer for recycling options.<br>▸ Consult State Land Waste Management Authority for disposal.<br>▸ Bury residue in an authorised landfill.<br>▸ Recycle containers if possible, or dispose of in an authorised landfill. |

## SECTION 14 TRANSPORT INFORMATION

### Labels Required

| | |
|---|---|
| **Marine Pollutant** | NO |
| **HAZCHEM** | Not Applicable |

**Land transport (ADG): NOT REGULATED FOR TRANSPORT OF DANGEROUS GOODS**

**Air transport (ICAO-IATA / DGR): NOT REGULATED FOR TRANSPORT OF DANGEROUS GOODS**

**Sea transport (IMDG-Code / GGVSee): NOT REGULATED FOR TRANSPORT OF DANGEROUS GOODS**

### Transport in bulk according to Annex II of MARPOL 73 / 78 and the IBC code

| Source | Ingredient | Pollution Category |
|---|---|---|

**Continued...**

| | | |
|---|---|---|
| IMO MARPOL 73/78 (Annex II) - List of Noxious Liquid Substances Carried in Bulk | titanium dioxide | Z |

## SECTION 15 REGULATORY INFORMATION

### Safety, health and environmental regulations / legislation specific for the substance or mixture

**SILICA CRYSTALLINE - QUARTZ(87347-84-0) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

**ALUMINIUM OXIDE(1344-28-1.) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Inventory of Chemical Substances (AICS)

- Not Applicable

**ALUMINIUM FLUOROSILICATE(17099-70-6) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists

**FERRIC OXIDE(1309-37-1) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

**MAGNESIUM OXIDE(1309-48-4.) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)

**TITANIUM DIOXIDE(98084-96-9) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

| National Inventory | Status |
|---|---|
| Australia - AICS | N (aluminium fluorosilicate) |
| Canada - DSL | N (aluminium fluorosilicate) |
| Canada - NDSL | N (aluminium fluorosilicate; silica crystalline - quartz; aluminium oxide; magnesium oxide; ferric oxide) |
| China - IECSC | N (aluminium fluorosilicate) |
| Europe - EINEC / ELINCS / NLP | Y |
| Japan - ENCS | N (aluminium fluorosilicate) |
| Korea - KECI | Y |
| New Zealand - NZIoC | N (aluminium fluorosilicate) |
| Philippines - PICCS | N (aluminium fluorosilicate) |
| USA - TSCA | N (aluminium fluorosilicate) |
| ***Legend:*** | *Y = All ingredients are on the inventory*<br>*N = Not determined or one or more ingredients are not on the inventory and are not exempt from listing(see specific ingredients in brackets)* |

## SECTION 16 OTHER INFORMATION

### Other information

### Ingredients with multiple cas numbers

| Name | CAS No |
|---|---|
| silica crystalline - quartz | 122304-48-7, 122304-49-8, 12425-26-2, 1317-79-9, 14808-60-7, 70594-95-5, 87347-84-0 |
| titanium dioxide | 100292-32-8, 101239-53-6, 116788-85-3, 12000-59-8, 12188-41-9, 12701-76-7, 12767-65-6, 12789-63-8, 1309-63-3, 1317-70-0, 1317-80-2, 1344-29-2, 13463-67-7, 185323-71-1, 185828-91-5, 188357-76-8, 188357-79-1, 195740-11-5, 221548-98-7, 224963-00-2, 246178-32-5, 252962-41-7, 37230-92-5, 37230-94-7, 37230-95-8, 37230-96-9, 39320-58-6, 39360-64-0, 39379-02-7, 416845-43-7, 494848-07-6, 494848-23-6, 494851-77-3, 494851-98-8, 55068-84-3, 55068-85-4, 552316-51-5, 62338-64-1, 767341-00-4, 97929-50-5, 98084-96-9 |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.
A list of reference resources used to assist the committee may be found at:
www.chemwatch.net

The (M)SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings. Risks may be determined by reference to Exposures Scenarios. Scale of use, frequency of use and current or available engineering controls must be considered.

### Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。

**Continued...**

IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection
OTV: Odour Threshold Value
BCF: BioConcentration Factors
BEI: Biological Exposure Index

# Tomago Anode Butt Shot Waste

## Tomago Aluminium

Chemwatch: **5004-04**
Version No: **3.1.1.1**
Safety Data Sheet according to WHS and ADG requirements

Issue Date: **27/06/2017**
Print Date: **17/07/2017**
S.GHS.AUS.EN

## SECTION 1 IDENTIFICATION OF THE SUBSTANCE / MIXTURE AND OF THE COMPANY / UNDERTAKING

### Product Identifier

| | |
|---|---|
| **Product name** | Tomago Anode Butt Shot Waste |
| **Synonyms** | scrap aluminium anode butt powder for recycle |
| **Other means of identification** | Not Available |

### Relevant identified uses of the substance or mixture and uses advised against

| | |
|---|---|
| **Relevant identified uses** | Alloying additive for steel making. Scrap from shot blasting electrofurnace anodes for recycling.. |

### Details of the supplier of the safety data sheet

| | |
|---|---|
| **Registered company name** | Tomago Aluminium |
| **Address** | Tomago Road Tomago NSW 2322 Australia |
| **Telephone** | +61 2 4966 9669 |
| **Fax** | +61 2 4966 9711 |
| **Website** | Not Available |
| **Email** | Not Available |

### Emergency telephone number

| | |
|---|---|
| **Association / Organisation** | Not Available |
| **Emergency telephone numbers** | Not Available |
| **Other emergency telephone numbers** | Not Available |

## SECTION 2 HAZARDS IDENTIFICATION

### Classification of the substance or mixture

| | |
|---|---|
| **Poisons Schedule** | S6 |
| **Classification [1]** | Carcinogenicity Category 1A, Specific target organ toxicity - repeated exposure Category 1, Acute Aquatic Hazard Category 3, Chronic Aquatic Hazard Category 3 |
| ***Legend:*** | *1. Classified by Chemwatch; 2. Classification drawn from HSIS ; 3. Classification drawn from EC Directive 1272/2008 - Annex VI* |

### Label elements

| | |
|---|---|
| **Hazard pictogram(s)** | |
| **SIGNAL WORD** | **DANGER** |

### Hazard statement(s)

| | |
|---|---|
| **H350** | May cause cancer. |
| **H372** | Causes damage to organs through prolonged or repeated exposure. |
| **H412** | Harmful to aquatic life with long lasting effects. |
| **AUH066** | Repeated exposure may cause skin dryness and cracking |

### Precautionary statement(s) Prevention

| | |
|---|---|
| **P201** | Obtain special instructions before use. |
| **P260** | Do not breathe dust/fume/gas/mist/vapours/spray. |

### Precautionary statement(s) Response

| | |
|---|---|
| **P308+P313** | IF exposed or concerned: Get medical advice/attention. |

**Continued...**

| | |
|---|---|
| **P314** | Get medical advice/attention if you feel unwell. |

### Precautionary statement(s) Storage

| | |
|---|---|
| **P405** | Store locked up. |

### Precautionary statement(s) Disposal

| | |
|---|---|
| **P501** | Dispose of contents/container in accordance with local regulations. |

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

### Substances

See section below for composition of Mixtures

### Mixtures

| CAS No | %[weight] | Name |
|---|---|---|
| | | carbon as |
| 65996-77-2 | >=60 | coke powder |
| 7439-89-6 | 10-30 | iron |
| | | mixed fluorides as |
| 7789-75-5 | <=1 | calcium fluoride |
| 15096-52-3 | <=15 | sodium aluminium fluoride |
| 7704-34-9. | <=2 | sulfur |
| | | other metals in amounts less than 0.1% |
| 7440-02-0 | ^ | nickel |
| 7440-21-3 | ^ | silicon |
| 7440-62-2 | | vanadium |
| | | NOTE: Manufacturer has supplied full ingredient |
| | | information to allow CHEMWATCH assessment. |

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Wash out immediately with fresh running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Seek medical attention without delay; if pain persists or recurs seek medical attention.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin or hair contact occurs:<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If dust is inhaled, remove from contaminated area.<br>▸ Encourage patient to blow nose to ensure clear breathing passages.<br>▸ Ask patient to rinse mouth with water but to not drink water.<br>▸ Seek immediate medical attention. |
| **Ingestion** | Rinse mouth out with plenty of water.<br>If poisoning occurs, contact a doctor or Poisons Information Centre.<br>▸ **IF SWALLOWED, REFER FOR MEDICAL ATTENTION, WHERE POSSIBLE, WITHOUT DELAY.**<br>▸ For advice, contact a Poisons Information Centre or a doctor.<br>**Where Medical attention is not immediately available or where the patient is more than 15 minutes from a hospital or unless instructed otherwise:**<br>▸ Induce vomiting with fingers down the back of the of the throat, **ONLY IF CONSCIOUS**.<br>▸ Lean patient forward or place on left side (head-down position if possible) to maintain open airway and prevent aspiration.<br>**NOTE:** Wear a protective glove when inducing vomiting by mechanical means.<br>▸ In the mean time, qualified first-aid personnel should treat the patient following observation and employing supportive measures as indicated by the patient's condition.<br>▸ If the services of a medical officer or medical doctor are readily available, the patient should be placed in his/her care and a copy of the SDS should be provided. Further action will be the responsibility of the medical specialist.<br>▸ If medical attention is not available on the worksite or surroundings send the patient to a hospital together with a copy of the SDS. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

- Water spray or fog.
- Foam.

### Special hazards arising from the substrate or mixture

**Continued...**

| | |
|---|---|
| **Fire Incompatibility** | Avoid contamination with strong oxidising agents as ignition may result |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | ▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ Wear breathing apparatus plus protective gloves in the event of a fire. |
| **Fire/Explosion Hazard** | Burns at high temperatures.<br>Moderate fire hazard when exposed to heat or flame.<br>Moderate dust explosion hazard, when exposed to flame<br><br>Decomposes on heating and produces toxic fumes of:<br>amp;43cw amp;11a amp;43cv,<br>fluorides |
| **HAZCHEM** | Not Applicable |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

See section 8

### Environmental precautions

See section 12

### Methods and material for containment and cleaning up

| | |
|---|---|
| **Minor Spills** | ▸ Remove all ignition sources.<br>▸ Clean up all spills immediately. |
| **Major Spills** | ▸ Clear area of personnel and move upwind.<br>▸ Alert Fire Brigade and tell them location and nature of hazard. |

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | Avoid generating and breathing dust.<br>▸ Limit all unnecessary personal contact.<br>▸ Wear protective clothing when risk of exposure occurs. |
| **Other information** | Keep dry; to avoid a violent steam explosion when added to molten metal<br>▸ Keep dry.<br>▸ Store under cover. |

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Check that containers are clearly labelled<br>▸ Packaging as recommended by manufacturer.<br>|Woven multiply bulker bags. |
| **Storage incompatibility** | Avoid storage with oxidisers<br>Avoid contamination of water, foodstuffs, feed or seed. |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

**OCCUPATIONAL EXPOSURE LIMITS (OEL)**

**INGREDIENT DATA**

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | nickel | Nickel, metal | 1 mg/m3 | Not Available | Not Available | Sen |
| Australia Exposure Standards | silicon | Silicon | 10 mg/m3 | Not Available | Not Available | Not Available |

**EMERGENCY LIMITS**

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| coke powder | Carbon; (Graphite, synthetic) | 6 mg/m3 | 16 mg/m3 | 95 mg/m3 |
| iron | Iron | 3.2 mg/m3 | 35 mg/m3 | 150 mg/m3 |
| calcium fluoride | Calcium fluoride | 15 mg/m3 | 170 mg/m3 | 1,000 mg/m3 |
| sulfur | Sulfur | 30 mg/m3 | 330 mg/m3 | 2,000 mg/m3 |
| nickel | Nickel | 4.5 mg/m3 | 50 mg/m3 | 99 mg/m3 |
| silicon | Silicon | 45 mg/m3 | 100 mg/m3 | 630 mg/m3 |
| vanadium | Vanadium | 3 mg/m3 | 5.8 mg/m3 | 35 mg/m3 |

| Ingredient | Original IDLH | Revised IDLH |
|---|---|---|
| coke powder | Not Available | Not Available |
| iron | Not Available | Not Available |

**Continued...**

| | | |
|---|---|---|
| calcium fluoride | 500 mg/m3 | 250 mg/m3 |
| sodium aluminium fluoride | Not Available | Not Available |
| sulfur | Not Available | Not Available |
| nickel | N.E. mg/m3 / N.E. ppm | 10 mg/m3 |
| silicon | Not Available | Not Available |
| vanadium | 70 mg/m3 | 35 mg/m3 |

### Exposure controls

| | |
|---|---|
| **Appropriate engineering controls** | Use in a well-ventilated area<br>Engineering controls are used to remove a hazard or place a barrier between the worker and the hazard. Well-designed engineering controls can be highly effective in protecting workers and will typically be independent of worker interactions to provide this high level of protection. |
| **Personal protection** | |
| **Eye and face protection** | ▸ Safety glasses with side shields; or as required,<br>▸ Chemical goggles.<br>▸ Contact lenses may pose a special hazard; soft contact lenses may absorb and concentrate irritants. |
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | Wear chemical protective gloves. e.g. PVC gloves with barrier cream Wear safety footwear. |
| **Body protection** | See Other protection below |
| **Other protection** | ▸ Overalls.<br>▸ Eyewash unit. |
| **Thermal hazards** | Not Available |

### Respiratory protection

Type AX-P Filter of sufficient capacity. (AS/NZS 1716 & 1715, EN 143:2000 & 149:2001, ANSI Z88 or national equivalent)

| Required Minimum Protection Factor | Half-Face Respirator | Full-Face Respirator | Powered Air Respirator |
|---|---|---|---|
| up to 10 x ES | AX P1<br>Air-line* | -<br>- | AX PAPR-P1<br>- |
| up to 50 x ES | Air-line** | AX P2 | AX PAPR-P2 |
| up to 100 x ES | - | AX P3 | - |
| | | Air-line* | - |
| 100+ x ES | - | Air-line** | AX PAPR-P3 |

* - Negative pressure demand ** - Continuous flow
A(All classes) = Organic vapours, B AUS or B1 = Acid gasses, B2 = Acid gas or hydrogen cyanide(HCN), B3 = Acid gas or hydrogen cyanide(HCN), E = Sulfur dioxide(SO2), G = Agricultural chemicals, K = Ammonia(NH3), Hg = Mercury, NO = Oxides of nitrogen, MB = Methyl bromide, AX = Low boiling point organic compounds(below 65 degC)

## SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

### Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Black granular powder; insoluble in water. No odour.\|Approximately 30% fraction greater than 0.5 mm size. |

| | | | |
|---|---|---|---|
| **Physical state** | Divided Solid | **Relative density (Water = 1)** | 1.5-1.7 |
| **Odour** | Not Available | **Partition coefficient n-octanol / water** | Not Available |
| **Odour threshold** | Not Available | **Auto-ignition temperature (°C)** | Not Applicable |
| **pH (as supplied)** | Not Available | **Decomposition temperature** | Not available. |
| **Melting point / freezing point (°C)** | Not Available | **Viscosity (cSt)** | Not Available |
| **Initial boiling point and boiling range (°C)** | Not Available | **Molecular weight (g/mol)** | Not Applicable |
| **Flash point (°C)** | Non Flammable | **Taste** | Not Available |
| **Evaporation rate** | Non Volatile | **Explosive properties** | Not Available |
| **Flammability** | Non Flammable | **Oxidising properties** | Not Available |
| **Upper Explosive Limit (%)** | Not available. | **Surface Tension (dyn/cm or mN/m)** | Not Applicable |
| **Lower Explosive Limit (%)** | Not available. | **Volatile Component (%vol)** | Nil @ 38 C. |
| **Vapour pressure (kPa)** | Negligible | **Gas group** | Not Available |
| **Solubility in water (g/L)** | Immiscible | **pH as a solution (1%)** | Not Available |
| **Vapour density (Air = 1)** | Not Applicable | **VOC g/L** | Not Available |

**Continued...**

## SECTION 10 STABILITY AND REACTIVITY

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | Generated dust may be discomforting amp;5400 amp;11amb amp;5044 amp;54i<br>Inhalation of dust may aggravate a pre-existing respiratory condition such as asthma, bronchitis, emphysema |
| **Ingestion** | Considered an unlikely route of entry in commercial/industrial environments<br>The solid/dust is<br>amp;5040 amp;11a amp;5044 amp;5110 Ingestion may result in nausea, abdominal irritation, pain and vomiting |
| **Skin Contact** | The material may be<br>amp;5054 amp;11a amp;5040 amp;5300 amp;531sk amp;5421<br>Solution of material in moisture on the skin, or perspiration, may increase irritant effects<br>Bare unprotected skin should not be exposed to this material<br>Toxic effects may result from skin absorption |
| **Eye** | The dust is<br>amp;5054 amp;11a amp;5040 amp;5200 amp;11ai amp;5213 |
| **Chronic** | Principal routes of exposure are usually by amp;5541m amp;11a amp;5553<br>Fluorides are easily absorbed through the skin and cause death of soft tissue and erode bone. Healing is delayed and death of tissue may continue to spread beneath skin.<br>Persons with impaired respiratory function, airway diseases and conditions such as emphysema or chronic bronchitis, may incur further disability if excessive concentrations of particulate are inhaled.<br>If prior damage to the circulatory or nervous systems has occurred or if kidney damage has been sustained, proper screenings should be conducted on individuals who may be exposed to further risk if handling and use of the material result<br>in excessive exposures. |

| | TOXICITY | IRRITATION |
|---|---|---|
| **Tomago Anode Butt Shot Waste** | Not Available | Not Available |
| **coke powder** | Not Available | Not Available |
| **iron** | Oral (rat) LD50: 98600 mg/kg][2] | Not Available |
| **calcium fluoride** | Oral (rat) LD50: 4250 mg/kgd[2] | Not Available |
| **sodium aluminium fluoride** | Oral (rat) LD50: >5000 mg/kgd[2] | Not Available |
| **sulfur** | dermal (rat) LD50: >2000 mg/kg[1]<br>Oral (rat) LD50: >2000 mg/kg[1] | Eye (human): 8 ppm irritant |
| **nickel** | Oral (rat) LD50: 5000 mg/kg[2] | Not Available |
| **silicon** | Oral (rat) LD50: 3160 mg/kgd[2] | Not Available |
| **vanadium** | Oral (rat) LD50: >2000 mg/kg[1] | Not Available |

| | |
|---|---|
| ***Legend:*** | *1. Value obtained from Europe ECHA Registered Substances - Acute toxicity 2.* Value obtained from manufacturer's SDS. Unless otherwise specified data extracted from RTECS - Register of Toxic Effect of chemical Substances* |

**Continued...**

| | |
|---|---|
| **COKE POWDER** | Substance has been investigated as a reproductive effector. TDLo: 167mg/kg |
| **NICKEL** | The following information refers to contact allergens as a group and may not be specific to this product.<br>Contact allergies quickly manifest themselves as contact eczema, more rarely as urticaria or Quincke's oedema.<br><br>**WARNING:** This substance has been classified by the IARC as Group 2B: Possibly Carcinogenic to Humans.<br>Tenth Annual Report on Carcinogens: Substance anticipated to be Carcinogen<br>[*National Toxicology Program: U.S. Dep. of Health & Human Services 2002*]<br>Oral (rat) TDLo: 500 mg/kg/5D-I Inhalation (rat) TCLo: 0.1 mg/m3/24H/17W-C |
| **SILICON** | Injection of silicon into the peritoneal cavity produced only minor local trauma and foreign body reaction. In animal testing, silicon dioxide given by mouth did not cause clinical signs or cell changes.<br>The material may be irritating to the eye, with prolonged contact causing inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis. |
| **CALCIUM FLUORIDE & SILICON** | Asthma-like symptoms may continue for months or even years after exposure to the material ends. This may be due to a non-allergic condition known as reactive airways dysfunction syndrome (RADS) which can occur after exposure to high levels of highly irritating compound. |
| **SODIUM ALUMINIUM FLUORIDE & SILICON** | No significant acute toxicological data identified in literature search. |

| | | | |

## SECTION 16 OTHER INFORMATION

### Other information

### Ingredients with multiple cas numbers

| Name | CAS No |
|---|---|
| coke powder | 65996-77-2, 7440-44-0 |
| calcium fluoride | 7789-75-5, 14542-23-5 |
| sodium aluminium fluoride | 15096-52-3, 13775-53-6, 1331-71-1 |
| silicon | 7440-21-3, 152284-21-4, 157383-37-4, 160371-18-6, 17375-03-0, 71536-23-7, 72516-01-9, 72516-02-0, 72516-03-1, 90337-93-2 |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.

The SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings.

### Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。
IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection
OTV: Odour Threshold Value
BCF: BioConcentration Factors
BEI: Biological Exposure Index

# Tomago Spent Potlining Refractory Byproduct

## Tomago Aluminium

Chemwatch: **4686-69**
Version No: **6.1.1.1**
Safety Data Sheet according to WHS and ADG requirements

Issue Date: **27/06/2017**
Print Date: **17/07/2017**
S.GHS.AUS.EN

## SECTION 1 IDENTIFICATION OF THE SUBSTANCE / MIXTURE AND OF THE COMPANY / UNDERTAKING

### Product Identifier

| | |
|---|---|
| **Product name** | Tomago Spent Potlining Refractory Byproduct |
| **Synonyms** | Not Available |
| **Proper shipping name** | ALUMINIUM SMELTING BY-PRODUCTS or ALUMINIUM REMELTING BY-PRODUCTS |
| **Other means of identification** | Not Available |

### Relevant identified uses of the substance or mixture and uses advised against

| | |
|---|---|
| **Relevant identified uses** | Raw material feed to produce refractory feedstock. IN THE PREPARATION OF FEEDSTOCK MATERIAL WATER CAN BE ADDED IN CONTROLLED WELL VENTILATED CONDITIONS. |

### Details of the supplier of the safety data sheet

| | |
|---|---|
| **Registered company name** | Tomago Aluminium |
| **Address** | Tomago Road Tomago NSW 2322 Australia |
| **Telephone** | +61 2 4966 9669 |
| **Fax** | +61 2 4966 9711 |
| **Website** | Not Available |
| **Email** | Not Available |

### Emergency telephone number

| | |
|---|---|
| **Association / Organisation** | Not Available |
| **Emergency telephone numbers** | Not Available |
| **Other emergency telephone numbers** | Not Available |

## SECTION 2 HAZARDS IDENTIFICATION

### Classification of the substance or mixture

| | |
|---|---|
| **Poisons Schedule** | S6 |
| **Classification [1]** | Emit Flammable Gases with Water Category 3, Acute Toxicity (Oral) Category 4, Skin Corrosion/Irritation Category 1B, Serious Eye Damage Category 1, Specific target organ toxicity - repeated exposure Category 2, Acute Aquatic Hazard Category 3, Chronic Aquatic Hazard Category 3 |
| ***Legend:*** | *1. Classified by Chemwatch; 2. Classification drawn from HSIS ; 3. Classification drawn from EC Directive 1272/2008 - Annex VI* |

### Label elements

| | |
|---|---|
| **Hazard pictogram(s)** | |
| **SIGNAL WORD** | **DANGER** |

### Hazard statement(s)

| | |
|---|---|
| **H261** | In contact with water releases flammable gases. |
| **H302** | Harmful if swallowed. |
| **H314** | Causes severe skin burns and eye damage. |
| **H373** | May cause damage to organs through prolonged or repeated exposure. |
| **H412** | Harmful to aquatic life with long lasting effects. |
| **AUH014** | Reacts violently with water |
| **AUH029** | Contact with water liberates toxic gas |
| **AUH032** | Contact with acid liberates very toxic gas |

Continued...

### Precautionary statement(s) Prevention

| | |
|---|---|
| **P231+P232** | Handle under inert gas. Protect from moisture. |
| **P260** | Do not breathe dust/fume/gas/mist/vapours/spray. |

### Precautionary statement(s) Response

| | |
|---|---|
| **P301+P330+P331** | IF SWALLOWED: Rinse mouth. Do NOT induce vomiting. |
| **P303+P361+P353** | IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower. |

### Precautionary statement(s) Storage

| | |
|---|---|
| **P405** | Store locked up. |
| **P402+P404** | Store in a dry place. Store in a closed container. |

### Precautionary statement(s) Disposal

| | |
|---|---|
| **P501** | Dispose of contents/container in accordance with local regulations. |

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

### Substances

See section below for composition of Mixtures

### Mixtures

| CAS No | %[weight] | Name |
|---|---|---|
| 14808-60-7 | 40-70 | silica crystalline - quartz |
| 1344-28-1. | 12-30 | aluminium oxide |
| 7440-44-0 | 2-5 | carbon, non-activated |
| 1310-73-2 | 1-2 | sodium hydroxide |
| 7681-49-4 | 5-11 | sodium fluoride |
| 15096-52-3 | 3-8 | sodium aluminium fluoride |
| 7789-75-5 | 0-1 | calcium fluoride |
| 1305-78-8 | 1-5 | calcium oxide |
| 7429-90-5 | 0-1 | aluminium |
| 7439-89-6 | 0-1 | iron |
| 1309-37-1 | 2-4 | ferric oxide |
| 7704-34-9. | 0-1 | sulfur |
| Not Available | 0-0.04 | free cyanide |

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Immediately hold eyelids apart and flush the eye continuously with running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Continue flushing until advised to stop by the Poisons Information Centre or a doctor, or for at least 15 minutes.<br>▸ Transport to hospital or doctor without delay.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin contact occurs:<br>▸ Immediately remove all contaminated clothing, including footwear.<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If dust is inhaled, remove from contaminated area.<br>▸ Encourage patient to blow nose to ensure clear breathing passages.<br>▸ Ask patient to rinse mouth with water but to not drink water.<br>▸ Seek immediate medical attention.<br>▸ If fumes or combustion products are inhaled remove from contaminated area.<br>▸ Lay patient down. Keep warm and rested.<br>▸ Prostheses such as false teeth, which may block airway, should be removed, where possible, prior to initiating first aid procedures.<br>▸ Apply artificial respiration if not breathing, preferably with a demand valve resuscitator, bag-valve mask device, or pocket mask as trained. Perform CPR if necessary.<br>▸ Transport to hospital, or doctor. |
| **Ingestion** | ▸ If swallowed do **NOT** induce vomiting.<br>▸ If vomiting occurs, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.<br>▸ Observe the patient carefully.<br>▸ Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious.<br>▸ Give water to rinse out mouth, then provide liquid slowly and as much as casualty can comfortably drink.<br>▸ Seek medical advice. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

**Continued...**

For acute or short-term repeated exposures to highly alkaline materials:
- Respiratory stress is uncommon but present occasionally because of soft tissue edema.
- Unless endotracheal intubation can be accomplished under direct vision, cricothyroidotomy or tracheotomy may be necessary.
- Oxygen is given as indicated.
- The presence of shock suggests perforation and mandates an intravenous line and fluid administration.
- Damage due to alkaline corrosives occurs by liquefaction necrosis whereby the saponification of fats and solubilisation of proteins allow deep penetration into the tissue.

Alkalis continue to cause damage after exposure.
INGESTION:
- Milk and water are the preferred diluents

No more than 2 glasses of water should be given to an adult.
- Neutralising agents should never be given since exothermic heat reaction may compound injury.

* Catharsis and emesis are absolutely contra-indicated.
* Activated charcoal does not absorb alkali.
* Gastric lavage should not be used.

Supportive care involves the following:
- Withhold oral feedings initially.
- If endoscopy confirms transmucosal injury start steroids only within the first 48 hours.
- Carefully evaluate the amount of tissue necrosis before assessing the need for surgical intervention.
- Patients should be instructed to seek medical attention whenever they develop difficulty in swallowing (dysphagia).

SKIN AND EYE:
- Injury should be irrigated for 20-30 minutes.

Eye injuries require saline. [Ellenhorn & Barceloux: Medical Toxicology]

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

- Dry sand.
- Dry chemical powder.
- **DO NOT** use halogenated fire extinguishing agents.
- **DO NOT** use water or halogens on dust fires.

|Small sodium fires can uccur in stored material. Extinguishing material for such|fires should not be water.

### Special hazards arising from the substrate or mixture

| | |
|---|---|
| **Fire Incompatibility** | ▸ Contact with water liberates highly flammable gases<br>▸ Reacts with water or steam to produce toxic and corrosive fumes |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | ▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ May be violently or explosively reactive. |
| **Fire/Explosion Hazard** | ▸ Non combustible.<br>▸ Not considered a significant fire risk, however containers may burn.<br><br>Decomposes on heating and produces toxic fumes of:<br>,<br>carbon dioxide (CO2)<br>,<br>hydrogen fluoride<br>,<br>sulfur oxides (SOx)<br>Avoid creating dust - may present dust explosion hazard. Dry dust can be electrostatically charged by turbulence, pneumatic transport, pouring, in exhaust ducts and during transport.<br>May emit poisonous fumes.<br>May emit corrosive fumes. |
| **HAZCHEM** | 4W |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

See section 8

### Environmental precautions

See section 12

### Methods and material for containment and cleaning up

| | |
|---|---|
| **Minor Spills** | ▸ Clean up all spills immediately.<br>▸ Avoid contact with skin and eyes. |
| **Major Spills** | ▸ Clear area of personnel and move upwind.<br>▸ Alert Fire Brigade and tell them location and nature of hazard. |

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | Remove all ignition sources.<br>▸ Limit all unnecessary personal contact.<br>▸ Wear protective clothing when risk of exposure occurs. |

**Continued...**

| | |
|---|---|
| **Other information** | ▸ Keep dry.<br>▸ Store under cover. |

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Polyethylene or polypropylene container.<br>▸ Check all containers are clearly labelled and free from leaks. |
| **Storage incompatibility** | ▸ Contact with acids produces toxic fumes<br><br>Contact with water liberates extremely flammable gases. |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

**OCCUPATIONAL EXPOSURE LIMITS (OEL)**

**INGREDIENT DATA**

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | silica crystalline - quartz | Silica - Crystalline: Quartz (respirable dust) | 0.1 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica crystalline - quartz | Quartz (respirable dust) | 0.1 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium oxide | Aluminium oxide | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | sodium hydroxide | Sodium hydroxide | Not Available | Not Available | 2 mg/m3 | Not Available |
| Australia Exposure Standards | calcium oxide | Calcium oxide | 2 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium | Aluminium (metal dust) | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium | Aluminium (welding fumes) (as Al) | 5 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium | Aluminium, pyro powders (as Al) | 5 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | ferric oxide | Iron oxide fume (Fe2O3) (as Fe) | 5 mg/m3 | Not Available | Not Available | Not Available |

**EMERGENCY LIMITS**

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| silica crystalline - quartz | Silica, crystalline-quartz; (Silicon dioxide) | 0.075 mg/m3 | 33 mg/m3 | 200 mg/m3 |
| aluminium oxide | Aluminum oxide; (Alumina) | 5.7 mg/m3 | 15 mg/m3 | 25 mg/m3 |
| carbon, non-activated | Carbon; (Graphite, synthetic) | 6 mg/m3 | 16 mg/m3 | 95 mg/m3 |
| sodium hydroxide | Sodium hydroxide | Not Available | Not Available | Not Available |
| sodium fluoride | Sodium fluoride | 17 mg/m3 | 90 mg/m3 | 1,100 mg/m3 |
| calcium fluoride | Calcium fluoride | 15 mg/m3 | 170 mg/m3 | 1,000 mg/m3 |
| calcium oxide | Calcium oxide | 6 mg/m3 | 110 mg/m3 | 660 mg/m3 |
| iron | Iron | 3.2 mg/m3 | 35 mg/m3 | 150 mg/m3 |
| ferric oxide | Iron oxide; (Ferric oxide) | 15 mg/m3 | 360 mg/m3 | 2,200 mg/m3 |
| sulfur | Sulfur | 30 mg/m3 | 330 mg/m3 | 2,000 mg/m3 |

| Ingredient | Original IDLH | Revised IDLH |
|---|---|---|
| silica crystalline - quartz | N.E. mg/m3 / N.E. ppm | 50 mg/m3 |
| aluminium oxide | Not Available | Not Available |
| carbon, non-activated | Not Available | Not Available |
| sodium hydroxide | 250 mg/m3 | 10 mg/m3 |
| sodium fluoride | 500 mg/m3 | 250 mg/m3 |
| sodium aluminium fluoride | Not Available | Not Available |
| calcium fluoride | 500 mg/m3 | 250 mg/m3 |
| calcium oxide | Unknown mg/m3 / Unknown ppm | 25 mg/m3 |
| aluminium | Not Available | Not Available |
| iron | Not Available | Not Available |
| ferric oxide | N.E. mg/m3 / N.E. ppm | 2,500 mg/m3 |
| sulfur | Not Available | Not Available |
| free cyanide | Not Available | Not Available |

### Exposure controls

| | |
|---|---|
| **Appropriate engineering controls** | Engineering controls are used to remove a hazard or place a barrier between the worker and the hazard. Well-designed engineering controls can be highly effective in protecting workers and will typically be independent of worker interactions to provide this high level of protection. |
| **Personal protection** | |
| **Eye and face protection** | ▸ Chemical goggles.<br>▸ Full face shield may be required for supplementary but never for primary protection of eyes. |

**Continued...**

| | |
|---|---|
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | Experience indicates that the following polymers are suitable as glove materials for protection against undissolved, dry solids, where abrasive particles are not present.<br>▸ polychloroprene.<br>The selection of suitable gloves does not only depend on the material, but also on further marks of quality which vary from manufacturer to manufacturer. Where the chemical is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application. |
| **Body protection** | See Other protection below |
| **Other protection** | ▸ Overalls.<br>▸ P.V.C. |
| **Thermal hazards** | Not Available |

### Recommended material(s)

**GLOVE SELECTION INDEX**

Glove selection is based on a modified presentation of the:
**"Forsberg Clothing Performance Index".**
The effect(s) of the following substance(s) are taken into account in the ***computer-generated*** selection:
Tomago Spent Potlining Refractory Byproduct

| Material | CPI |
|---|---|
| BUTYL | C |
| NAT+NEOPR+NITRILE | C |
| NATURAL RUBBER | C |
| NATURAL+NEOPRENE | C |
| NEOPRENE | C |
| NEOPRENE/NATURAL | C |
| NITRILE | C |
| NITRILE+PVC | C |
| PE | C |
| PE/EVAL/PE | C |
| PVC | C |
| SARANEX-23 | C |
| SARANEX-23 2-PLY | C |
| TEFLON | C |
| VITON/CHLOROBUTYL | C |
| ##sodium | fluoride |

* CPI - Chemwatch Performance Index
A: Best Selection
B: Satisfactory; may degrade after 4 hours continuous immersion
C: Poor to Dangerous Choice for other than short term immersion
**NOTE**: As a series of factors will influence the actual performance of the glove, a final selection must be based on detailed observation. -
* Where the glove is to be used on a short term, casual or infrequent basis, factors such as "feel" or convenience (e.g. disposability), may dictate a choice of gloves which might otherwise be unsuitable following long-term or frequent use. A qualified practitioner should be consulted.

### Respiratory protection

Particulate. (AS/NZS 1716 & 1715, EN 143:2000 & 149:001, ANSI Z88 or national equivalent)

Where the concentration of gas/particulates in the breathing zone, approaches or exceeds the "Exposure Standard" (or ES), respiratory protection is required.
Degree of protection varies with both face-piece and Class of filter; the nature of protection varies with Type of filter.

| Required Minimum Protection Factor | Half-Face Respirator | Full-Face Respirator | Powered Air Respirator |
|---|---|---|---|
| up to 10 x ES | -AUS P2 | - | -PAPR-AUS / Class 1 P2 |
| up to 50 x ES | - | -AUS / Class 1 P2 | - |
| up to 100 x ES | - | -2 P2 | -PAPR-2 P2 ^ |

^ - Full-face
A(All classes) = Organic vapours, B AUS or B1 = Acid gasses, B2 = Acid gas or hydrogen cyanide(HCN), B3 = Acid gas or hydrogen cyanide(HCN), E = Sulfur dioxide(SO2), G = Agricultural chemicals, K = Ammonia(NH3), Hg = Mercury, NO = Oxides of nitrogen, MB = Methyl bromide, AX = Low boiling point organic compounds(below 65 degC)

## SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

### Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Grey solid with varying granulometry and white salt encrustment; does not mix\|with water. \|contact with moisture. |

| | | | |
|---|---|---|---|
| **Physical state** | Solid | **Relative density (Water = 1)** | Not Available |
| **Odour** | Not Available | **Partition coefficient n-octanol / water** | Not Available |
| **Odour threshold** | Not Available | **Auto-ignition temperature (°C)** | Not Applicable |
| **pH (as supplied)** | Not Applicable | **Decomposition temperature** | Not Available |
| **Melting point / freezing point (°C)** | Not Available | **Viscosity (cSt)** | Not Applicable |
| **Initial boiling point and boiling range (°C)** | Not Applicable | **Molecular weight (g/mol)** | Not Applicable |
| **Flash point (°C)** | Not Applicable | **Taste** | Not Available |
| **Evaporation rate** | Not Available | **Explosive properties** | Not Available |
| **Flammability** | Not Applicable | **Oxidising properties** | Not Available |
| **Upper Explosive Limit (%)** | Not Applicable | **Surface Tension (dyn/cm or mN/m)** | Not Applicable |

**Continued...**

| | | | |
|---|---|---|---|
| **Lower Explosive Limit (%)** | Not Applicable | **Volatile Component (%vol)** | Not Applicable |
| **Vapour pressure (kPa)** | Not Available | **Gas group** | Not Available |
| **Solubility in water (g/L)** | Immiscible | **pH as a solution (1%)** | Not Available |
| **Vapour density (Air = 1)** | Not Applicable | **VOC g/L** | Not Available |

## SECTION 10 STABILITY AND REACTIVITY

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | Inhalation of vapours or aerosols (mists, fumes), generated by the material during the course of normal handling, may be damaging to the health of the individual.<br>Inhaling corrosive bases may irritate the respiratory tract. Symptoms include cough, choking, pain and damage to the mucous membrane.<br>Acute silicosis occurs under conditions of extremely high silica dust exposure particularly when the particle size of the dust is small. The disease is rapidly progressive and spreads widely through the lungs within months of the initial exposure and causing death within 1 to 2 years.<br>Effects on lungs are significantly enhanced in the presence of respirable particles. |
| **Ingestion** | Accidental ingestion of the material may be harmful; animal experiments indicate that ingestion of less than 150 gram may be fatal or may produce serious damage to the health of the individual.<br>The material can produce chemical burns within the oral cavity and gastrointestinal tract following ingestion.<br>Ingestion of alkaline corrosives may produce burns around the mouth, ulcerations and swellings of the mucous membranes, profuse saliva production, with an inability to speak or swallow. Both the oesophagus and stomach may experience burning pain; vomiting and diarrhoea may follow.<br>Fluoride causes severe loss of calcium in the blood, with symptoms appearing several hours later including painful and rigid muscle contractions of the limbs. Cardiovascular collapse can occur and may cause death with increased heart rate and other heart rhythm irregularities. |
| **Skin Contact** | The material can produce chemical burns following direct contact with the skin. Toxic effects may result from skin absorption<br>Fluorides are easily absorbed through the skin and cause death of soft tissue and erode bone. Healing is delayed and death of tissue may continue to spread beneath skin.<br>Entry into the blood-stream, through, for example, cuts, abrasions or lesions, may produce systemic injury with harmful effects. Examine the skin prior to the use of the material and ensure that any external damage is suitably protected. |
| **Eye** | The material can produce chemical burns to the eye following direct contact. Vapours or mists may be extremely irritating. |
| **Chronic** | Repeated or prolonged exposure to corrosives may result in the erosion of teeth, inflammatory and ulcerative changes in the mouth and necrosis (rarely) of the jaw. Bronchial irritation, with cough, and frequent attacks of bronchial pneumonia may ensue.<br>Extended exposure to inorganic fluorides causes fluorosis, which includes signs of joint pain and stiffness, tooth discolouration, nausea and vomiting, loss of appetite, diarrhoea or constipation, weight loss, anaemia, weakness and general unwellness. There may also be frequent urination and thirst.<br>Crystalline silicas activate the inflammatory response of white blood cells after they injure the lung epithelium. Chronic exposure to crystalline silicas reduces lung capacity and predisposes to chest infections. |

|---|---|
| ***Legend:*** | *1. Value obtained from Europe ECHA Registered Substances - Acute toxicity 2.* Value obtained from manufacturer's SDS. Unless otherwise specified data extracted from RTECS - Register of Toxic Effect of chemical Substances* |

| | |
|---|---|
| **SILICA CRYSTALLINE - QUARTZ** | **WARNING:** For inhalation exposure ONLY: This substance has been classified by the IARC as Group 1: **CARCINOGENIC TO HUMANS**<br><br>The International Agency for Research on Cancer (IARC) has classified occupational exposures to **respirable** (<5 um) crystalline silica as being carcinogenic to humans . This classification is based on what IARC considered sufficient evidence from epidemiological studies of humans for the carcinogenicity of inhaled silica in the forms of quartz and cristobalite. |
| **CARBON, NON-ACTIVATED** | Substance has been investigated as a reproductive effector. |
| **SODIUM HYDROXIDE** | The material may produce severe irritation to the eye causing pronounced inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The material may cause severe skin irritation after prolonged or repeated exposure and may produce on contact skin redness, swelling, the production of vesicles, scaling and thickening of the skin. Repeated exposures may produce severe ulceration. |
| **SODIUM FLUORIDE** | The material may produce moderate eye irritation leading to inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The substance is classified by IARC as Group 3:<br>**NOT** classifiable as to its carcinogenicity to humans.<br>Evidence of carcinogenicity may be inadequate or limited in animal testing. |
| **ALUMINIUM OXIDE & SODIUM ALUMINIUM FLUORIDE & ALUMINIUM** | No significant acute toxicological data identified in literature search. |
| **SODIUM HYDROXIDE & SODIUM FLUORIDE & CALCIUM FLUORIDE & CALCIUM OXIDE & FERRIC OXIDE** | Asthma-like symptoms may continue for months or even years after exposure to the material ends. This may be due to a non-allergic condition known as reactive airways dysfunction syndrome (RADS) which can occur after exposure to high levels of highly irritating compound. |

Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
Do NOT allow product to come in contact with surface waters or to intertidal areas below the mean high water mark. Do not contaminate water when cleaning equipment or disposing of equipment wash-waters.
**DO NOT** discharge into sewer or waterways.

### Persistence and degradability

| Ingredient | Persistence: Water/Soil | Persistence: Air |
|---|---|---|
| sodium hydroxide | LOW | LOW |
| sodium fluoride | LOW | LOW |
| sulfur | LOW | LOW |

### Bioaccumulative potential

| Ingredient | Bioaccumulation |
|---|---|
| sodium hydroxide | LOW (LogKOW = -3.8796) |
| sodium fluoride | LOW (BCF = 6.4) |
| sulfur | LOW (LogKOW = 0.229) |

### Mobility in soil

| Ingredient | Mobility |
|---|---|
| sodium hydroxide | LOW (KOC = 14.3) |
| sodium fluoride | LOW (KOC = 14.3) |
| sulfur | LOW (KOC = 14.3) |

## SECTION 13 DISPOSAL CONSIDERATIONS

### Waste treatment methods

| | |
|---|---|
| **Product / Packaging disposal** | ▸ Recycle wherever possible or consult manufacturer for recycling options.<br>▸ Consult State Land Waste Management Authority for disposal. |

## SECTION 14 TRANSPORT INFORMATION

### Labels Required

| | |
|---|---|
| | |
| **Marine Pollutant** | NO |
| **HAZCHEM** | 4W |

### Land transport (ADG)

| | |
|---|---|
| **UN number** | 3170 |
| **UN proper shipping name** | ALUMINIUM SMELTING BY-PRODUCTS or ALUMINIUM REMELTING BY-PRODUCTS |
| **Transport hazard class(es)** | Class: 4.3<br>Subrisk: Not Applicable |
| **Packing group** | III |
| **Environmental hazard** | Not Applicable |
| **Special precautions for user** | Special provisions: 223 244<br>Limited quantity: 1 kg |

### Air transport (ICAO-IATA / DGR)

| | |
|---|---|
| **UN number** | 3170 |
| **UN proper shipping name** | Aluminium remelting by-products; Aluminium smelting by-products |
| **Transport hazard class(es)** | ICAO/IATA Class: 4.3<br>ICAO / IATA Subrisk: Not Applicable<br>ERG Code: 4W |
| **Packing group** | III |
| **Environmental hazard** | Not Applicable |

**Continued...**

| | | |
|---|---|---|
| **Special precautions for user** | Special provisions | A3A102 |
| | Cargo Only Packing Instructions | 491 |
| | Cargo Only Maximum Qty / Pack | 100 kg |
| | Passenger and Cargo Packing Instructions | 486 |
| | Passenger and Cargo Maximum Qty / Pack | 25 kg |
| | Passenger and Cargo Limited Quantity Packing Instructions | Y477 |
| | Passenger and Cargo Limited Maximum Qty / Pack | 10 kg |

### Sea transport (IMDG-Code / GGVSee)

| | | |
|---|---|---|
| **UN number** | 3170 | |
| **UN proper shipping name** | ALUMINIUM SMELTING BY-PRODUCTS or ALUMINIUM RE-MELTING BY-PRODUCTS | |
| **Transport hazard class(es)** | IMDG Class | 4.3 |
| | IMDG Subrisk | Not Applicable |
| **Packing group** | III | |
| **Environmental hazard** | Not Applicable | |
| **Special precautions for user** | EMS Number | F-G , S-P |
| | Special provisions | 223 244 |
| | Limited Quantities | 1 kg |

### Transport in bulk according to Annex II of MARPOL and the IBC code

Not Applicable

## SECTION 15 REGULATORY INFORMATION

### Safety, health and environmental regulations / legislation specific for the substance or mixture

**SILICA CRYSTALLINE - QUARTZ(14808-60-7) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

**ALUMINIUM OXIDE(1344-28-1.) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Inventory of Chemical Substances (AICS)

**CARBON, NON-ACTIVATED(7440-44-0) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs
International Air Transport Association (IATA) Dangerous Goods Regulations - Prohibited List Passenger and Cargo Aircraft

**SODIUM HYDROXIDE(1310-73-2) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)

**SODIUM FLUORIDE(7681-49-4) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

**SODIUM ALUMINIUM FLUORIDE(15096-52-3) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

**CALCIUM FLUORIDE(7789-75-5) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

**CALCIUM OXIDE(1305-78-8) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)

**ALUMINIUM(7429-90-5) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Exposure Standards
Australia Hazardous Substances Information System - Consolidated Lists
Australia Inventory of Chemical Substances (AICS)

**IRON(7439-89-6) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

Australia Inventory of Chemical Substances (AICS)
International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs

**FERRIC OXIDE(1309-37-1) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

**Continued...**

| | |
|---|---|
| Australia Exposure Standards | Australia Inventory of Chemical Substances (AICS) |
| Australia Hazardous Substances Information System - Consolidated Lists | International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs |

**SULFUR(7704-34-9.) IS FOUND ON THE FOLLOWING REGULATORY LISTS**

| | |
|---|---|
| Australia Hazardous Substances Information System - Consolidated Lists | International Agency for Research on Cancer (IARC) - Agents Classified by the IARC Monographs |
| Australia Inventory of Chemical Substances (AICS) | |

| National Inventory | Status |
|---|---|
| Australia - AICS | Y |
| Canada - DSL | Y |
| Canada - NDSL | N (sulfur; silica crystalline - quartz; aluminium oxide; sodium fluoride; aluminium; carbon, non-activated; ferric oxide; iron; calcium oxide; sodium hydroxide) |
| China - IECSC | Y |
| Europe - EINEC / ELINCS / NLP | Y |
| Japan - ENCS | N (sulfur; silica crystalline - quartz; aluminium oxide; sodium fluoride; aluminium; carbon, non-activated; sodium aluminium fluoride; iron; calcium oxide) |
| Korea - KECI | Y |
| New Zealand - NZIoC | Y |
| Philippines - PICCS | Y |
| USA - TSCA | Y |
| ***Legend:*** | *Y = All ingredients are on the inventory*<br>*N = Not determined or one or more ingredients are not on the inventory and are not exempt from listing(see specific ingredients in brackets)* |

## SECTION 16 OTHER INFORMATION

### Other information

### Ingredients with multiple cas numbers

| Name | CAS No |
|---|---|
| silica crystalline - quartz | 14808-60-7, 122304-48-7, 122304-49-8, 12425-26-2, 1317-79-9, 70594-95-5, 87347-84-0, 308075-07-2 |
| carbon, non-activated | 7440-44-0, 82600-58-6 |
| sodium hydroxide | 1310-73-2, 12200-64-5 |
| sodium aluminium fluoride | 15096-52-3, 13775-53-6, 1331-71-1 |
| calcium fluoride | 7789-75-5, 14542-23-5 |
| aluminium | 7429-90-5, 91728-14-2 |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.

The SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings.

### Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。
IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection
OTV: Odour Threshold Value
BCF: BioConcentration Factors
BEI: Biological Exposure Index

# HiCAl 30 Mineralising Carbon

**Regain Services Pty Ltd**

Version No: **1.2**
Safety Data Sheet according to WHS and ADG requirements

Issue Date: **02/11/2017**
Print Date: **02/11/2017**
S.GHS.AUS.EN

## SECTION 1 IDENTIFICATION OF THE SUBSTANCE / MIXTURE AND OF THE COMPANY / UNDERTAKING

### Product Identifier

| | |
|---|---|
| **Product name** | HiCAl 30 Mineralising Carbon |
| **Synonyms** | Not Available |
| **Other means of identification** | Not Available |

### Relevant identified uses of the substance or mixture and uses advised against

| | |
|---|---|
| **Relevant identified uses** | A mineral product rich in fluoride, sodium, alumina and carbon. Designed for use in cement clinker manufacture. The presence of fluoride may result in a beneficial fluxing and/or mineralisation effect that reduces firing temperature and promotes desired phase formation in manufacture of cement clinker. The presence of sodium may improve the burning process and sulphur binding thereby improving kiln operation and clinker quality. The presence of carbon may substitute other types of fuels used for clinkerization. |

### Details of the supplier of the safety data sheet

| | |
|---|---|
| **Registered company name** | **Regain Services Pty Ltd** |
| **Address** | Level 12, 390 St. Kilda Road Melbourne Victoria Australia |
| **Telephone** | +61 3 9514 8600 |
| **Fax** | +61 3 9514 8642 |
| **Website** | www.regainmaterials.com |
| **Email** | info@regainmaterials.com |

### Emergency telephone number

| | |
|---|---|
| **Association / Organisation** | **Not Available** |
| **Emergency telephone numbers** | +61 3 9514 8600 |
| **Other emergency telephone numbers** | +61 417 556 831 |

## SECTION 2 HAZARDS IDENTIFICATION

### Classification of the substance or mixture

| | |
|---|---|
| **Poisons Schedule** | Not Applicable |
| **Classification [1]** | Acute Toxicity (Oral) Category 4, Skin Corrosion/Irritation Category 2, Eye Irritation Category 2A, Specific target organ toxicity - repeated exposure Category 2 |
| ***Legend:*** | *1. Classified by Chemwatch; 2. Classification drawn from HSIS ; 3. Classification drawn from EC Directive 1272/2008 - Annex VI* |

### Label elements

| | |
|---|---|
| **Hazard pictogram(s)** | |
| **SIGNAL WORD** | **WARNING** |

### Hazard statement(s)

| | |
|---|---|
| **H302** | Harmful if swallowed. |
| **H315** | Causes skin irritation. |
| **H319** | Causes serious eye irritation. |
| **H373** | May cause damage to organs through prolonged or repeated exposure. |

### Precautionary statement(s) Prevention

| | |
|---|---|
| **P260** | Do not breathe dust/fume/gas/mist/vapours/spray. |
| **P270** | Do not eat, drink or smoke when using this product. |

**Continued...**

### Precautionary statement(s) Response

| | |
|---|---|
| **P362** | Take off contaminated clothing and wash before reuse. |
| **P305+P351+P338** | IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. |

### Precautionary statement(s) Storage

Not Applicable

### Precautionary statement(s) Disposal

| | |
|---|---|
| **P501** | Dispose of contents/container in accordance with local regulations. |

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

### Substances

See section below for composition of Mixtures

### Mixtures

| CAS No | %[weight] | Name |
|---|---|---|
| 7440-44-0 | 30-35 | carbon, non-activated |
| 1302-93-8 | 10-15 | mullite |
| 7681-49-4 | 10-15 | sodium fluoride |
| 12251-27-3 | 5-10 | nepheline |
| 15096-52-3 | 5-10 | sodium aluminium fluoride |
| 1344-28-1. | 5-10 | aluminium oxide |
| 60676-86-0 | 0-5 | silica fused |
| 1309-38-2 | 0-5 | magnetite |
| 7789-75-5 | 0-5 | calcium fluoride |

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Wash out immediately with fresh running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Seek medical attention without delay; if pain persists or recurs seek medical attention.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin contact occurs:<br>▸ Immediately remove all contaminated clothing, including footwear.<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If fumes, aerosols or combustion products are inhaled remove from contaminated area.<br>▸ Other measures are usually unnecessary. |
| **Ingestion** | ▸ **IF SWALLOWED, REFER FOR MEDICAL ATTENTION, WHERE POSSIBLE, WITHOUT DELAY.**<br>▸ For advice, contact a Poisons Information Centre or a doctor.<br>▸ Urgent hospital treatment is likely to be needed.<br>▸ In the mean time, qualified first-aid personnel should treat the patient following observation and employing supportive measures as indicated by the patient's condition.<br>▸ If the services of a medical officer or medical doctor are readily available, the patient should be placed in his/her care and a copy of the SDS should be provided. Further action will be the responsibility of the medical specialist.<br>▸ If medical attention is not available on the worksite or surroundings send the patient to a hospital together with a copy of the SDS.<br>**Where medical attention is not immediately available or where the patient is more than 15 minutes from a hospital or unless instructed otherwise:**<br>▸ **INDUCE** vomiting with fingers down the back of the throat, **ONLY IF CONSCIOUS**. Lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.<br>**NOTE:** Wear a protective glove when inducing vomiting by mechanical means. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

For acute or short term repeated exposures to fluorides:

- Fluoride absorption from gastro-intestinal tract may be retarded by calcium salts, milk or antacids.
- Fluoride particulates or fume may be absorbed through the respiratory tract with 20-30% deposited at alveolar level.
- Peak serum levels are reached 30 mins. post-exposure; 50% appears in the urine within 24 hours.
- For acute poisoning (endotracheal intubation if inadequate tidal volume), monitor breathing and evaluate/monitor blood pressure and pulse frequently since shock may supervene with little warning. Monitor ECG immediately; watch for arrhythmias and evidence of Q-T prolongation or T-wave changes. Maintain monitor. Treat shock vigorously with isotonic saline (in 5% glucose) to restore blood volume and enhance renal excretion.
- Where evidence of hypocalcaemic or normocalcaemic tetany exists, calcium gluconate (10 ml of a 10% solution) is injected to avoid tachycardia.

BIOLOGICAL EXPOSURE INDEX - BEI

These represent the determinants observed in specimens collected from a healthy worker exposed at the Exposure Standard (ES or TLV):

| Determinant | Index | Sampling Time | Comments |
|---|---|---|---|
| Fluorides in urine | 3 mg/gm creatinine | Prior to shift | B, NS |
| | 10mg/gm creatinine | End of shift | B, NS |

**Continued...**

B: Background levels occur in specimens collected from subjects **NOT** exposed

NS: Non-specific determinant; also observed after exposure to other exposures.

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

- Use dry chemical or CO2. Cover with dry earth, sand or other non-combustible material.

### Special hazards arising from the substrate or mixture

| | |
|---|---|
| **Fire Incompatibility** | ▸ Avoid contamination with oxidising agents i.e. nitrates, oxidising acids, chlorine bleaches, pool chlorine etc. as ignition may result |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | ▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ Wear breathing apparatus plus protective gloves in the event of a fire.<br>▸ Prevent, by any means available, spillage from entering drains or water courses<br>▸ DO NOT Approach containers suspected to be hot.<br>▸ Cool fire exposed containers with water spray from a protected location.<br>▸ If safe to do so, remove containers from path of fire.<br>▸ Equipment should be thouroughly decontaminated after use. |
| **Fire/Explosion Hazard** | Combustion products include:<br>carbon monoxide (CO)<br>carbon dioxide (CO2)<br>hydrogen fluoride<br>silicon dioxide (SiO2)<br>May emit poisonous fumes.<br>May emit corrosive fumes. |
| **HAZCHEM** | Not Applicable |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

See section 8

### Environmental precautions

See section 12

### Methods and material for containment and cleaning up

| | |
|---|---|
| **Minor Spills** | ▸ Clean up all spills immediately.<br>▸ Avoid contact with skin and eyes.<br>▸ Control personal contact with substance, by using protective Equipment.<br>▸ Use dry clean up procedures and avoid generating dust. |
| **Major Spills** | Moderate hazard.<br>▸ **CAUTION**:Advise personnel in area.<br>▸ Control personal contact by wearing protective clothing.<br>▸ Prevent, by any means available, spillage from entering drains or water courses.<br>▸ Recover product wherever possible.<br>▸ **IF DRY**:Use dry clean up procedures and avoid generating dust. Collect residues and place in sealed plastic bags or other containers for disposal. **IF WET**: Vacuum/shovel up and place in labelled containers for disposal. |

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | ▸ Wear protective clothing when risk of exposure occurs.<br>▸ Use in a well-ventilated area.<br>▸ When handling, **DO NOT** eat, drink or smoke.<br>▸ Keep containers securely sealed when not in use.<br>▸ Avoid physical damage to containers.<br>▸ Always wash hands with soap and water after handling.<br>▸ Work clothes should be laundered separately. Launder contaminated clothing before re-use.<br>▸ Use good occupational work practice.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS. |
| **Other information** | ▸ Store in ventilated area.<br>▸ Store in a cool, dry area protected from environmental extremes.<br>▸ Avoid run-off water.<br>▸ Store away from incompatible materials and foodstuff containers.<br>▸ Protect containers against physical damage and check regularly for leaks.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS.<br>For major quantities:<br>▸ Consider storage in bunded areas - ensure storage areas are isolated from sources of community water (including stormwater, ground water, lakes and streams).<br>▸ Ensure that accidental discharge to air or water is the subject of a contingency disaster management plan. |

**Continued...**

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Store in accordance with manufacturer's recommendation and local regulation.<br>▸ Store in segregated and approved area.<br>▸ Store so as to avoid dust generation and dispersal. |
| **Storage incompatibility** | For aluminas (aluminium oxide):<br>Incompatible with hot chlorinated rubber.<br>In the presence of chlorine trifluoride may react violently and ignite.<br>Sodium fluoride:<br>▸ aqueous solutions attack glass and react violently with xenon hexafluoride; are incompatible with sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin<br>▸ reacts with acids forming hydrogen fluoride<br>▸ Contact with acids produces toxic fumes<br>For carbon powders:<br>▸ Avoid oxidising agents, reducing agents. |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

**OCCUPATIONAL EXPOSURE LIMITS (OEL)**

**INGREDIENT DATA**

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | aluminium oxide | a-Alumina (Al2O3) | Not Available | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium oxide | Aluminium oxide | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica fused | Silica, fused | Not Available | Not Available | Not Available | Not Available |

**EMERGENCY LIMITS**

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| carbon, non-activated | Carbon; (Graphite, synthetic) | 6 mg/m3 | 16 mg/m3 | 95 mg/m3 |
| sodium fluoride | Sodium fluoride | 17 mg/m3 | 90 mg/m3 | 1,100 mg/m3 |
| aluminium oxide | Aluminum oxide; (Alumina) | 5.7 mg/m3 | 15 mg/m3 | 25 mg/m3 |
| calcium fluoride | Calcium fluoride | 15 mg/m3 | 170 mg/m3 | 1,000 mg/m3 |

| Ingredient | Original IDLH | Revised IDLH |
|---|---|---|
| carbon, non-activated | Not Available | Not Available |
| mullite | Not Available | Not Available |
| sodium fluoride | 250 mg/m3 | Not Available |
| nepheline | Not Available | Not Available |
| sodium aluminium fluoride | Not Available | Not Available |
| aluminium oxide | Not Available | Not Available |
| silica fused | Not Available | Not Available |
| magnetite | Not Available | Not Available |
| calcium fluoride | 250 mg/m3 | Not Available |

### Exposure controls

| | |
|---|---|
| **Appropriate engineering controls** | Use only with adequate ventilation. If user operations generate dust, fumes, gas, vapor or mist, use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits. Engineering controls may be required to control the primary or secondary risks associated with this product. The engineering controls also need to keep gas, vapor or dust concentrations below any lower explosive limits.Use explosion-proof ventilation Equipment. |
| **Personal protection** | |
| **Eye and face protection** | Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn unless the assessment indicates a higher degree of protection:chemical splash goggles. |
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product. Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. Considering the parameters specified by the glove manufacturer, check during use that the gloves are still retaining their protective properties. It should be noted that the time to breakthrough for any glove material may be different for different glove manufacturers. In the case of mixtures, consisting of several substances, the protection time of the gloves cannot be accurately estimated.<br>Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location. |
| **Body protection** | See Other protection below |

**Continued...**

| | |
|---|---|
| **Other protection** | Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification. Respirators must be used according to a respiratory protection program to ensure proper fitting, training, and other important spects of use. Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product. |
| **Thermal hazards** | Not Available |

### Recommended material(s)

**GLOVE SELECTION INDEX**

Glove selection is based on a modified presentation of the:
***"Forsberg Clothing Performance Index".***
The effect(s) of the following substance(s) are taken into account in the ***computer-generated*** selection:
HiCAl 30 Mineralising Carbon

| Material | CPI |
|---|---|
| NATURAL RUBBER | A |
| NEOPRENE | A |
| NITRILE | A |
| PVC | A |

* CPI - Chemwatch Performance Index
A: Best Selection
B: Satisfactory; may degrade after 4 hours continuous immersion
C: Poor to Dangerous Choice for other than short term immersion
**NOTE**: As a series of factors will influence the actual performance of the glove, a final selection must be based on detailed observation. -
* Where the glove is to be used on a short term, casual or infrequent basis, factors such as "feel" or convenience (e.g. disposability), may dictate a choice of gloves which might otherwise be unsuitable following long-term or frequent use. A qualified practitioner should be consulted.

### Respiratory protection

**Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification.**

## SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

### Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Dark |

| | | | |
|---|---|---|---|
| **Physical state** | Solid | **Relative density (Water = 1)** | 1.3 |
| **Odour** | Ammonia-Like | **Partition coefficient n-octanol / water** | Not Available |
| **Odour threshold** | Not Available | **Auto-ignition temperature (°C)** | Not Applicable |
| **pH (as supplied)** | Not Available | **Decomposition temperature** | Not Applicable |
| **Melting point / freezing point (°C)** | Not Applicable | **Viscosity (cSt)** | Not Applicable |
| **Initial boiling point and boiling range (°C)** | Not Applicable | **Molecular weight (g/mol)** | Not Applicable |
| **Flash point (°C)** | Not Applicable | **Taste** | Not Available |
| **Evaporation rate** | Not Available | **Explosive properties** | Not Available |
| **Flammability** | Not Applicable | **Oxidising properties** | Not Available |
| **Upper Explosive Limit (%)** | Not Applicable | **Surface Tension (dyn/cm or mN/m)** | Not Applicable |
| **Lower Explosive Limit (%)** | Not Applicable | **Volatile Component (%vol)** | Negligible |
| **Vapour pressure (kPa)** | Not Applicable | **Gas group** | Not Available |
| **Solubility in water (g/L)** | Not Applicable | **pH as a solution (1%)** | Not Applicable |
| **Vapour density (Air = 1)** | Not Applicable | **VOC g/L** | Not Applicable |

## SECTION 10 STABILITY AND REACTIVITY

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | The material is not thought to produce either adverse health effects or irritation of the respiratory tract following inhalation (as classified by EC Directives using animal models). Nevertheless, adverse systemic effects have been produced following exposure of animals by at least one other route and good |

**Continued...**

| | |
|---|---|
| | hygiene practice requires that exposure be kept to a minimum and that suitable control measures be used in an occupational setting. |
| **Ingestion** | Accidental ingestion of the material may be harmful; animal experiments indicate that ingestion of less than 150 gram may be fatal or may produce serious damage to the health of the individual.<br>Acute toxic responses to aluminium are confined to the more soluble forms. |
| **Skin Contact** | This material can cause inflammation of the skin on contact in some persons.<br>The material may accentuate any pre-existing dermatitis condition<br>Though considered non-harmful, slight irritation may result from contact because of the abrasive nature of the aluminium oxide particles. Thus it may cause itching and skin reaction and inflammation.<br>Open cuts, abraded or irritated skin should not be exposed to this material |
| **Eye** | This material can cause eye irritation and damage in some persons.<br>Eyes exposed to carbon particulates may be liable to irritation and burning. These can remain in the eye causing inflammation lasting weeks, and can cause permanent dark dotty discolouration. |
| **Chronic** | Long-term exposure to the product is not thought to produce chronic effects adverse to the health (as classified by EC Directives using animal models); nevertheless exposure by all routes should be minimised as a matter of course. |

| Not Available | Not Available |

**magnetite**

| TOXICITY | IRRITATION |
|---|---|
| Oral (rat) LD50: >10000 mg/kg[2] | Not Available |

**calcium fluoride**

| TOXICITY | IRRITATION |
|---|---|
| Oral (rat) LD50: 4250 mg/kg[2] | Not Available |

| | |
|---|---|
| ***Legend:*** | *1. Value obtained from Europe ECHA Registered Substances - Acute toxicity 2.* Value obtained from manufacturer's SDS. Unless otherwise specified data extracted from RTECS - Register of Toxic Effect of chemical Substances* |

| | |
|---|---|
| **CARBON, NON-ACTIVATED** | Substance has been investigated as a reproductive effector. |
| **MULLITE** | No data of toxicological significance identified in literature search. |
| **SODIUM FLUORIDE** | The material may produce moderate eye irritation leading to inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The substance is classified by IARC as Group 3:<br>**NOT** classifiable as to its carcinogenicity to humans.<br>Evidence of carcinogenicity may be inadequate or limited in animal testing. |
| **NEPHELINE** | No data available No data available |
| **SODIUM ALUMINIUM FLUORIDE** | No significant acute toxicological data identified in literature search. |

**Continued...**

| | |
|---|---|
| **SILICA FUSED** | For silica amorphous:<br>When experimental animals inhale synthetic amorphous silica (SAS) dust, it dissolves in the lung fluid and is rapidly eliminated. If swallowed, the vast majority of SAS is excreted in the faeces and there is little accumulation in the body.<br>Inhalation (rat) TCLo: 197 mg/m3/6H/26W-I |
| **SODIUM FLUORIDE & CALCIUM FLUORIDE** | Asthma-like symptoms may continue for months or even years after exposure to the material ends. This may be due to a non-allergic condition known as reactive airways dysfunction syndrome (RADS) which can occur after exposure to high levels of highly irritating compound. |

## SECTION 16 OTHER INFORMATION

### Other information

### Ingredients with multiple cas numbers

| Name | CAS No |
|---|---|
| carbon, non-activated | 7440-44-0, 82600-58-6 |
| mullite | 1302-93-8, 61027-90-5 |
| nepheline | 12251-27-3, 37244-96-5 |
| sodium aluminium fluoride | 15096-52-3, 13775-53-6, 1331-71-1 |
| aluminium oxide | 1344-28-1., 1011245-20-7, 1022097-81-9, 107462-07-7, 107874-14-6, 1097999-44-4, 1197416-35-5, 122784-35-4, 1234495-70-5, 1239586-42-5, 12522-88-2, 127361-04-0, 12737-16-5, 131689-14-0, 1346644-15-2, 135152-65-7, 1355357-83-3, 135667-70-8, 138361-58-7, 148619-39-0, 152743-26-5, 153858-98-1, 157516-29-5, 163581-50-8, 165390-91-0, 170448-81-4, 190401-78-6, 200295-99-4, 205316-36-5, 209552-43-2, 230616-05-4, 252756-35-7, 253606-46-1, 253606-47-2, 253606-45-0, 268724-08-9, 39354-49-9, 457654-46-5, 488831-46-5, 521982-71-8, 53809-96-4, 54352-04-4, 546141-61-1, 663170-52-3, 67853-35-4, 67894-14-8, 67894-42-2, 68189-68-4, 68389-42-4, 68389-43-5, 74871-10-6, 76363-81-0, 84149-21-3, 90669-62-8, 916225-60-0, 960377-08-6, 11092-32-3 |
| calcium fluoride | 7789-75-5, 14542-23-5 |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.
The SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings.

### Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。
IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection
OTV: Odour Threshold Value
BCF: BioConcentration Factors
BEI: Biological Exposure Index

# HiCAl 40 Mineralising Carbon

**Regain Services Pty Ltd**

Version No: **2.1**
Safety Data Sheet according to WHS and ADG requirements

Issue Date: **04/11/2017**
Print Date: **04/11/2017**
S.GHS.AUS.EN

## SECTION 1 IDENTIFICATION OF THE SUBSTANCE / MIXTURE AND OF THE COMPANY / UNDERTAKING

### Product Identifier

| | |
|---|---|
| **Product name** | HiCAl 40 Mineralising Carbon |
| **Synonyms** | Not Available |
| **Other means of identification** | Not Available |

### Relevant identified uses of the substance or mixture and uses advised against

| | |
|---|---|
| **Relevant identified uses** | A mineral product rich in fluoride, sodium, alumina and carbon. Designed for use in cement clinker manufacture. The presence of fluoride may result in a beneficial fluxing and/or mineralisation effect that reduces firing temperature and promotes desired phase formation in manufacture of cement clinker. The presence of sodium may improve the burning process and sulphur binding thereby improving kiln operation and clinker quality. The presence of carbon may substitute other types of fuels used for clinkerization. |

### Details of the supplier of the safety data sheet

| | |
|---|---|
| **Registered company name** | **Regain Services Pty Ltd** |
| **Address** | Level 12, 390 St. Kilda Road Melbourne Victoria Australia |
| **Telephone** | +61 3 9514 8600 |
| **Fax** | +61 3 9514 8642 |
| **Website** | www.regainmaterials.com |
| **Email** | info@regainmaterials.com |

### Emergency telephone number

| | |
|---|---|
| **Association / Organisation** | **Not Available** |
| **Emergency telephone numbers** | +61 3 9514 8600 |
| **Other emergency telephone numbers** | +61 417 556 831 |

## SECTION 2 HAZARDS IDENTIFICATION

### Classification of the substance or mixture

| | |
|---|---|
| **Poisons Schedule** | Not Applicable |
| **Classification [1]** | Acute Toxicity (Oral) Category 4, Skin Corrosion/Irritation Category 2, Eye Irritation Category 2A, Specific target organ toxicity - repeated exposure Category 2 |
| ***Legend:*** | *1. Classified by Chemwatch; 2. Classification drawn from HSIS ; 3. Classification drawn from EC Directive 1272/2008 - Annex VI* |

### Label elements

| | |
|---|---|
| **Hazard pictogram(s)** | |
| **SIGNAL WORD** | **WARNING** |

### Hazard statement(s)

| | |
|---|---|
| **H302** | Harmful if swallowed. |
| **H315** | Causes skin irritation. |
| **H319** | Causes serious eye irritation. |
| **H373** | May cause damage to organs through prolonged or repeated exposure. |

### Precautionary statement(s) Prevention

| | |
|---|---|
| **P260** | Do not breathe dust/fume/gas/mist/vapours/spray. |
| **P270** | Do not eat, drink or smoke when using this product. |

**Continued...**

### Precautionary statement(s) Response

| | |
|---|---|
| **P362** | Take off contaminated clothing and wash before reuse. |
| **P305+P351+P338** | IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. |

### Precautionary statement(s) Storage

Not Applicable

### Precautionary statement(s) Disposal

| | |
|---|---|
| **P501** | Dispose of contents/container in accordance with local regulations. |

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

### Substances

See section below for composition of Mixtures

### Mixtures

| CAS No | %[weight] | Name |
|---|---|---|
| 7440-44-0 | 40-45 | carbon, non-activated |
| 1302-93-8 | 10-15 | mullite |
| 7681-49-4 | 10-15 | sodium fluoride |
| 12251-27-3 | 5-10 | nepheline |
| 15096-52-3 | 5-10 | sodium aluminium fluoride |
| 1344-28-1. | 5-10 | aluminium oxide |
| 60676-86-0 | 0-5 | silica fused |
| 1309-38-2 | 0-5 | magnetite |
| 7789-75-5 | 0-5 | calcium fluoride |

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Wash out immediately with fresh running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Seek medical attention without delay; if pain persists or recurs seek medical attention.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin contact occurs:<br>▸ Immediately remove all contaminated clothing, including footwear.<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If fumes, aerosols or combustion products are inhaled remove from contaminated area.<br>▸ Other measures are usually unnecessary. |
| **Ingestion** | ▸ **IF SWALLOWED, REFER FOR MEDICAL ATTENTION, WHERE POSSIBLE, WITHOUT DELAY.**<br>▸ For advice, contact a Poisons Information Centre or a doctor.<br>▸ Urgent hospital treatment is likely to be needed.<br>▸ In the mean time, qualified first-aid personnel should treat the patient following observation and employing supportive measures as indicated by the patient's condition.<br>▸ If the services of a medical officer or medical doctor are readily available, the patient should be placed in his/her care and a copy of the SDS should be provided. Further action will be the responsibility of the medical specialist.<br>▸ If medical attention is not available on the worksite or surroundings send the patient to a hospital together with a copy of the SDS.<br>**Where medical attention is not immediately available or where the patient is more than 15 minutes from a hospital or unless instructed otherwise:**<br>▸ **INDUCE** vomiting with fingers down the back of the throat, **ONLY IF CONSCIOUS**. Lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.<br>**NOTE:** Wear a protective glove when inducing vomiting by mechanical means. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

For acute or short term repeated exposures to fluorides:

- Fluoride absorption from gastro-intestinal tract may be retarded by calcium salts, milk or antacids.
- Fluoride particulates or fume may be absorbed through the respiratory tract with 20-30% deposited at alveolar level.
- Peak serum levels are reached 30 mins. post-exposure; 50% appears in the urine within 24 hours.
- For acute poisoning (endotracheal intubation if inadequate tidal volume), monitor breathing and evaluate/monitor blood pressure and pulse frequently since shock may supervene with little warning. Monitor ECG immediately; watch for arrhythmias and evidence of Q-T prolongation or T-wave changes. Maintain monitor. Treat shock vigorously with isotonic saline (in 5% glucose) to restore blood volume and enhance renal excretion.
- Where evidence of hypocalcaemic or normocalcaemic tetany exists, calcium gluconate (10 ml of a 10% solution) is injected to avoid tachycardia.

BIOLOGICAL EXPOSURE INDEX - BEI

These represent the determinants observed in specimens collected from a healthy worker exposed at the Exposure Standard (ES or TLV):

| Determinant | Index | Sampling Time | Comments |
|---|---|---|---|
| Fluorides in urine | 3 mg/gm creatinine | Prior to shift | B, NS |
| | 10mg/gm creatinine | End of shift | B, NS |

**Continued...**

B: Background levels occur in specimens collected from subjects **NOT** exposed

NS: Non-specific determinant; also observed after exposure to other exposures.

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

- Use dry chemical or CO2. Cover with dry earth, sand or other non-combustible material.

### Special hazards arising from the substrate or mixture

| | |
|---|---|
| **Fire Incompatibility** | ▸ Avoid contamination with oxidising agents i.e. nitrates, oxidising acids, chlorine bleaches, pool chlorine etc. as ignition may result |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | ▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ Wear breathing apparatus plus protective gloves in the event of a fire.<br>▸ Prevent, by any means available, spillage from entering drains or water courses<br>▸ DO NOT Approach containers suspected to be hot.<br>▸ Cool fire exposed containers with water spray from a protected location.<br>▸ If safe to do so, remove containers from path of fire.<br>▸ Equipment should be thouroughly decontaminated after use. |
| **Fire/Explosion Hazard** | Combustion products include:<br>carbon monoxide (CO)<br>carbon dioxide (CO2)<br>hydrogen fluoride<br>other pyrolysis products typical of burning organic material.<br>May emit poisonous fumes.<br>May emit corrosive fumes. |
| **HAZCHEM** | Not Applicable |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

See section 8

### Environmental precautions

See section 12

### Methods and material for containment and cleaning up

| | |
|---|---|
| **Minor Spills** | ▸ Clean up all spills immediately.<br>▸ Avoid contact with skin and eyes.<br>▸ Control personal contact with substance, by using protective Equipment.<br>▸ Use dry clean up procedures and avoid generating dust. |
| **Major Spills** | Moderate hazard.<br>▸ **CAUTION**:Advise personnel in area.<br>▸ Control personal contact by wearing protective clothing.<br>▸ Prevent, by any means available, spillage from entering drains or water courses.<br>▸ Recover product wherever possible.<br>▸ **IF DRY:** Use dry clean up procedures and avoid generating dust. Collect residues and place in sealed plastic bags or other containers for disposal. **IF WET:** Vacuum/shovel up and place in labelled containers for disposal. |

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | ▸ Wear protective clothing when risk of exposure occurs.<br>▸ Use in a well-ventilated area.<br>▸ When handling, DO NOT eat, drink or smoke.<br>▸ Keep containers securely sealed when not in use.<br>▸ Avoid physical damage to containers.<br>▸ Always wash hands with soap and water after handling.<br>▸ Work clothes should be laundered separately. Launder contaminated clothing before re-use.<br>▸ Use good occupational work practice.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS. |
| **Other information** | ▸ Store in ventilated area.<br>▸ Store in a cool, dry area protected from environmental extremes.<br>▸ Avoid run-off water.<br>▸ Store away from incompatible materials and foodstuff containers.<br>▸ Protect containers against physical damage and check regularly for leaks.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS.<br>For major quantities:<br>▸ Consider storage in bunded areas - ensure storage areas are isolated from sources of community water (including stormwater, ground water, lakes and streams).<br>▸ Ensure that accidental discharge to air or water is the subject of a contingency disaster management plan. |

**Continued...**

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Store in accordance with manufacturer's recommendation and local regulation.<br>▸ Store in segregated and approved area.<br>▸ Store so as to avoid dust generation and dispersal. |
| **Storage incompatibility** | For aluminas (aluminium oxide):<br>Incompatible with hot chlorinated rubber.<br>In the presence of chlorine trifluoride may react violently and ignite.<br>Sodium fluoride:<br>▸ aqueous solutions attack glass and react violently with xenon hexafluoride; are incompatible with sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin<br>▸ reacts with acids forming hydrogen fluoride<br>▸ Contact with acids produces toxic fumes<br>For carbon powders:<br>▸ Avoid oxidising agents, reducing agents. |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

**OCCUPATIONAL EXPOSURE LIMITS (OEL)**

**INGREDIENT DATA**

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | aluminium oxide | a-Alumina (Al2O3) | Not Available | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium oxide | Aluminium oxide | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica fused | Silica, fused | Not Available | Not Available | Not Available | Not Available |

**EMERGENCY LIMITS**

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| carbon, non-activated | Carbon; (Graphite, synthetic) | 6 mg/m3 | 16 mg/m3 | 95 mg/m3 |
| sodium fluoride | Sodium fluoride | 17 mg/m3 | 90 mg/m3 | 1,100 mg/m3 |
| aluminium oxide | Aluminum oxide; (Alumina) | 5.7 mg/m3 | 15 mg/m3 | 25 mg/m3 |
| calcium fluoride | Calcium fluoride | 15 mg/m3 | 170 mg/m3 | 1,000 mg/m3 |

| Ingredient | Original IDLH | Revised IDLH |
|---|---|---|
| carbon, non-activated | Not Available | Not Available |
| mullite | Not Available | Not Available |
| sodium fluoride | 250 mg/m3 | Not Available |
| nepheline | Not Available | Not Available |
| sodium aluminium fluoride | Not Available | Not Available |
| aluminium oxide | Not Available | Not Available |
| silica fused | Not Available | Not Available |
| magnetite | Not Available | Not Available |
| calcium fluoride | 250 mg/m3 | Not Available |

### Exposure controls

| | |
|---|---|
| **Appropriate engineering controls** | Use only with adequate ventilation. If user operations generate dust, fumes, gas, vapor or mist, use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits. Engineering controls may be required to control the primary or secondary risks associated with this product. The engineering controls also need to keep gas, vapor or dust concentrations below any lower explosive limits.Use explosion-proof ventilation Equipment. |
| **Personal protection** | |
| **Eye and face protection** | Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn unless the assessment indicates a higher degree of protection:chemical splash goggles. |
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product. Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. Considering the parameters specified by the glove manufacturer, check during use that the gloves are still retaining their protective properties. It should be noted that the time to breakthrough for any glove material may be different for different glove manufacturers. In the case of mixtures, consisting of several substances, the protection time of the gloves cannot be accurately estimated.<br>Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location. |
| **Body protection** | See Other protection below |

**Continued...**

| | |
|---|---|
| **Other protection** | Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification. Respirators must be used according to a respiratory protection program to ensure proper fitting, training, and other important spects of use. Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product. |
| **Thermal hazards** | Not Available |

### Recommended material(s)

**GLOVE SELECTION INDEX**

Glove selection is based on a modified presentation of the:
***"Forsberg Clothing Performance Index".***
The effect(s) of the following substance(s) are taken into account in the ***computer-generated*** selection:
HiCAl 40 Mineralising Carbon

| Material | CPI |
|---|---|
| NATURAL RUBBER | A |
| NEOPRENE | A |
| NITRILE | A |
| PVC | A |

* CPI - Chemwatch Performance Index
A: Best Selection
B: Satisfactory; may degrade after 4 hours continuous immersion
C: Poor to Dangerous Choice for other than short term immersion
**NOTE**: As a series of factors will influence the actual performance of the glove, a final selection must be based on detailed observation. -
* Where the glove is to be used on a short term, casual or infrequent basis, factors such as "feel" or convenience (e.g. disposability), may dictate a choice of gloves which might otherwise be unsuitable following long-term or frequent use. A qualified practitioner should be consulted.

### Respiratory protection

**Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification.**

## SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

### Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Dark |

| | | | |
|---|---|---|---|
| **Physical state** | Solid | **Relative density (Water = 1)** | 1.3 |
| **Odour** | Ammonia-Like | **Partition coefficient n-octanol / water** | Not Available |
| **Odour threshold** | Not Available | **Auto-ignition temperature (°C)** | Not Applicable |
| **pH (as supplied)** | Not Applicable | **Decomposition temperature** | Not Applicable |
| **Melting point / freezing point (°C)** | Not Applicable | **Viscosity (cSt)** | Not Applicable |
| **Initial boiling point and boiling range (°C)** | Not Applicable | **Molecular weight (g/mol)** | Not Applicable |
| **Flash point (°C)** | Not Applicable | **Taste** | Not Available |
| **Evaporation rate** | Not Available | **Explosive properties** | Not Available |
| **Flammability** | Not Applicable | **Oxidising properties** | Not Available |
| **Upper Explosive Limit (%)** | Not Applicable | **Surface Tension (dyn/cm or mN/m)** | Not Applicable |
| **Lower Explosive Limit (%)** | Not Applicable | **Volatile Component (%vol)** | Negligible |
| **Vapour pressure (kPa)** | Not Applicable | **Gas group** | Not Available |
| **Solubility in water (g/L)** | Not Applicable | **pH as a solution (1%)** | Not Applicable |
| **Vapour density (Air = 1)** | Not Applicable | **VOC g/L** | Not Applicable |

## SECTION 10 STABILITY AND REACTIVITY

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | The material is not thought to produce either adverse health effects or irritation of the respiratory tract following inhalation (as classified by EC Directives using animal models). Nevertheless, adverse systemic effects have been produced following exposure of animals by at least one other route and good |

**Continued...**

| | |
|---|---|
| | hygiene practice requires that exposure be kept to a minimum and that suitable control measures be used in an occupational setting. |
| **Ingestion** | Accidental ingestion of the material may be harmful; animal experiments indicate that ingestion of less than 150 gram may be fatal or may produce serious damage to the health of the individual.<br>Acute toxic responses to aluminium are confined to the more soluble forms. |
| **Skin Contact** | This material can cause inflammation of the skin on contact in some persons.<br>The material may accentuate any pre-existing dermatitis condition<br>Though considered non-harmful, slight irritation may result from contact because of the abrasive nature of the aluminium oxide particles. Thus it may cause itching and skin reaction and inflammation.<br>Open cuts, abraded or irritated skin should not be exposed to this material |
| **Eye** | This material can cause eye irritation and damage in some persons.<br>Eyes exposed to carbon particulates may be liable to irritation and burning. These can remain in the eye causing inflammation lasting weeks, and can cause permanent dark dotty discolouration. |
| **Chronic** | Long-term exposure to the product is not thought to produce chronic effects adverse to the health (as classified by EC Directives using animal models); nevertheless exposure by all routes should be minimised as a matter of course. |

| | |
|---|---|
| ***Legend:*** | *1. Value obtained from Europe ECHA Registered Substances - Acute toxicity 2.* Value obtained from manufacturer's SDS. Unless otherwise specified data extracted from RTECS - Register of Toxic Effect of chemical Substances* |

| | |
|---|---|
| **CARBON, NON-ACTIVATED** | Substance has been investigated as a reproductive effector. |
| **MULLITE** | No data of toxicological significance identified in literature search. |
| **SODIUM FLUORIDE** | The material may produce moderate eye irritation leading to inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The substance is classified by IARC as Group 3:<br>**NOT** classifiable as to its carcinogenicity to humans.<br>Evidence of carcinogenicity may be inadequate or limited in animal testing. |
| **NEPHELINE** | No data available No data available |
| **SODIUM ALUMINIUM FLUORIDE** | No significant acute toxicological data identified in literature search. |

**Continued...**

| | |
|---|---|
| **SILICA FUSED** | For silica amorphous:<br>When experimental animals inhale synthetic amorphous silica (SAS) dust, it dissolves in the lung fluid and is rapidly eliminated. If swallowed, the vast majority of SAS is excreted in the faeces and there is little accumulation in the body.<br>Inhalation (rat) TCLo: 197 mg/m3/6H/26W-I |
| **SODIUM FLUORIDE & CALCIUM FLUORIDE** | Asthma-like symptoms may continue for months or even years after exposure to the material ends. This may be due to a non-allergic condition known as reactive airways dysfunction syndrome (RADS) which can occur after exposure to high levels of highly irritating compound. |

METI (Japan) - Bioconcentration Data 8. Vendor Data* |

Bentonite and kaolin have low toxicity to aquatic species, a large number of which have been tested
For Fluorides: Small amounts of fluoride have beneficial effects however; excessive intake over long periods may cause dental and/or skeletal fluorosis. Fluorides are absorbed by humans following inhalation of workplace and ambient air that has been contaminated, ingestion of drinking water and foods and dermal contact.
For Aluminium and its Compunds and Salts:
Environmental Fate - As an element, aluminium cannot be degraded in the environment, but may undergo various precipitation or ligand exchange reactions. Aluminium in compounds has only one oxidation state (+3), and would not undergo oxidation-reduction reactions under environmental conditions.
**DO NOT** discharge into sewer or waterways.

### Persistence and degradability

| Ingredient | Persistence: Water/Soil | Persistence: Air |
|---|---|---|
| sodium fluoride | LOW | LOW |

### Bioaccumulative potential

| Ingredient | Bioaccumulation |
|---|---|
| sodium fluoride | LOW (BCF = 6.4) |

### Mobility in soil

| Ingredient | Mobility |
|---|---|
| sodium fluoride | LOW (KOC = 14.3) |

## SECTION 13 DISPOSAL CONSIDERATIONS

### Waste treatment methods

| | |
|---|---|
| **Product / Packaging disposal** | ▸ Containers may still present a chemical hazard/ danger when empty.<br>▸ Return to supplier for reuse/ recycling if possible.<br>Otherwise:<br>▸ Recycle whereever possible or consult manufacturer for recycling options.<br>▸ Consult local land waste management authority for disposal.<br>▸ Bury residue in an authorized landfill.<br>▸ Recycle containers if possible, or dispose in an authorized landfill.<br>▸ **DO NOT**allow wash water from cleaning or process equipment to enter drains. |

## SECTION 14 TRANSPORT INFORMATION

### Labels Required

| | |
|---|---|
| **Marine Pollutant** | NO |
| **HAZCHEM** | Not Applicable |

### Land transport (ADG): NOT REGULATED FOR TRANSPORT OF DANGEROUS GOODS

### Air transport (ICAO-IATA / DGR): NOT REGULATED FOR TRANSPORT OF DANGEROUS GOODS

### Sea transport (IMDG-Code / GGVSee): NOT REGULATED FOR TRANSPORT OF DANGEROUS GOODS

### Transport in bulk according to Annex II of MARPOL and the IBC code

Not Applicable

## SECTION 15 REGULATORY INFORMATION

### Safety, health and environmental regulations / legislation specific for the substance or mixture

## SECTION 16 OTHER INFORMATION

### Other information

### Ingredients with multiple cas numbers

| Name | CAS No |
|---|---|
| carbon, non-activated | 7440-44-0, 82600-58-6 |
| mullite | 1302-93-8, 61027-90-5 |
| nepheline | 12251-27-3, 37244-96-5 |
| sodium aluminium fluoride | 15096-52-3, 13775-53-6, 1331-71-1 |
| aluminium oxide | 1344-28-1., 1011245-20-7, 1022097-81-9, 107462-07-7, 107874-14-6, 1097999-44-4, 1197416-35-5, 122784-35-4, 1234495-70-5, 1239586-42-5, 12522-88-2, 127361-04-0, 12737-16-5, 131689-14-0, 1346644-15-2, 135152-65-7, 1355357-83-3, 135667-70-8, 138361-58-7, 148619-39-0, 152743-26-5, 153858-98-1, 157516-29-5, 163581-50-8, 165390-91-0, 170448-81-4, 190401-78-6, 200295-99-4, 205316-36-5, 209552-43-2, 230616-05-4, 252756-35-7, 253606-46-1, 253606-47-2, 253606-45-0, 268724-08-9, 39354-49-9, 457654-46-5, 488831-46-5, 521982-71-8, 53809-96-4, 54352-04-4, 546141-61-1, 663170-52-3, 67853-35-4, 67894-14-8, 67894-42-2, 68189-68-4, 68389-42-4, 68389-43-5, 74871-10-6, 76363-81-0, 84149-21-3, 90669-62-8, 916225-60-0, 960377-08-6, 11092-32-3 |
| calcium fluoride | 7789-75-5, 14542-23-5 |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.
The SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings.

### Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。
IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection
OTV: Odour Threshold Value
BCF: BioConcentration Factors
BEI: Biological Exposure Index

# HiCAl-R Clinker Mineraliser

**Regain Services Pty Ltd**

Version No: **1.1**
Safety Data Sheet according to WHS and ADG requirements

Issue Date: **03/11/2017**
Print Date: **03/11/2017**
S.GHS.AUS.EN

## SECTION 1 IDENTIFICATION OF THE SUBSTANCE / MIXTURE AND OF THE COMPANY / UNDERTAKING

### Product Identifier

| | |
|---|---|
| **Product name** | HiCAl-R Clinker Mineraliser |
| **Synonyms** | Not Available |
| **Other means of identification** | Not Available |

### Relevant identified uses of the substance or mixture and uses advised against

| | |
|---|---|
| **Relevant identified uses** | A mineral product rich in fluoride, sodium and alumina. Designed for use in cement clinker manufacture. The presence of fluoride may result in a beneficial fluxing and/or mineralisation effect that reduces firing temperature and promotes desired phase formation in manufacture of cement clinker. The presence of sodium may improve the burning process and sulphur binding thereby improving kiln operation and clinker quality. The presence of alumina may substitute other types of correctives used for raw mix preparation. |

### Details of the supplier of the safety data sheet

| | |
|---|---|
| **Registered company name** | **Regain Services Pty Ltd** |
| **Address** | Level 12, 390 St. Kilda Road Melbourne Victoria Australia |
| **Telephone** | +61 3 9514 8600 |
| **Fax** | +61 3 9514 8642 |
| **Website** | www.regainmaterials.com |
| **Email** | info@regainmaterials.com |

### Emergency telephone number

| | |
|---|---|
| **Association / Organisation** | **Not Available** |
| **Emergency telephone numbers** | +61 3 9514 8600 |
| **Other emergency telephone numbers** | +61 417 556 831 |

## SECTION 2 HAZARDS IDENTIFICATION

### Classification of the substance or mixture

| | |
|---|---|
| **Poisons Schedule** | Not Applicable |
| **Classification [1]** | Acute Toxicity (Oral) Category 4, Skin Corrosion/Irritation Category 2, Eye Irritation Category 2A, Specific target organ toxicity - repeated exposure Category 2 |
| ***Legend:*** | *1. Classified by Chemwatch; 2. Classification drawn from HSIS ; 3. Classification drawn from EC Directive 1272/2008 - Annex VI* |

### Label elements

| | |
|---|---|
| **Hazard pictogram(s)** | |
| **SIGNAL WORD** | **WARNING** |

### Hazard statement(s)

| | |
|---|---|
| **H302** | Harmful if swallowed. |
| **H315** | Causes skin irritation. |
| **H319** | Causes serious eye irritation. |
| **H373** | May cause damage to organs through prolonged or repeated exposure. |

### Precautionary statement(s) Prevention

| | |
|---|---|
| **P260** | Do not breathe dust/fume/gas/mist/vapours/spray. |
| **P270** | Do not eat, drink or smoke when using this product. |

**Continued...**

### Precautionary statement(s) Response

| | |
|---|---|
| **P362** | Take off contaminated clothing and wash before reuse. |
| **P305+P351+P338** | IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. |

### Precautionary statement(s) Storage

Not Applicable

### Precautionary statement(s) Disposal

| | |
|---|---|
| **P501** | Dispose of contents/container in accordance with local regulations. |

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

### Substances

See section below for composition of Mixtures

### Mixtures

| CAS No | %[weight] | Name |
|---|---|---|
| 12251-27-3 | 15-20 | nepheline |
| 99439-28-8 | 10-15 | silica, fumed |
| 7681-49-4 | 10-15 | sodium fluoride |
| 1302-93-8 | 10-15 | mullite |
| 1344-28-1. | 5-10 | aluminium oxide |
| 15096-52-3 | 5-10 | sodium aluminium fluoride |
| 7440-44-0 | 5-10 | carbon, non-activated |
| 1309-38-2 | 0-5 | magnetite |
| 7789-75-5 | 0-5 | calcium fluoride |

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Wash out immediately with fresh running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Seek medical attention without delay; if pain persists or recurs seek medical attention.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin contact occurs:<br>▸ Immediately remove all contaminated clothing, including footwear.<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If fumes, aerosols or combustion products are inhaled remove from contaminated area.<br>▸ Other measures are usually unnecessary. |
| **Ingestion** | ▸ **IF SWALLOWED, REFER FOR MEDICAL ATTENTION, WHERE POSSIBLE, WITHOUT DELAY.**<br>▸ For advice, contact a Poisons Information Centre or a doctor.<br>▸ Urgent hospital treatment is likely to be needed.<br>▸ In the mean time, qualified first-aid personnel should treat the patient following observation and employing supportive measures as indicated by the patient's condition.<br>▸ If the services of a medical officer or medical doctor are readily available, the patient should be placed in his/her care and a copy of the SDS should be provided. Further action will be the responsibility of the medical specialist.<br>▸ If medical attention is not available on the worksite or surroundings send the patient to a hospital together with a copy of the SDS.<br>**Where medical attention is not immediately available or where the patient is more than 15 minutes from a hospital or unless instructed otherwise:**<br>▸ **INDUCE** vomiting with fingers down the back of the throat, **ONLY IF CONSCIOUS**. Lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.<br>**NOTE:** Wear a protective glove when inducing vomiting by mechanical means. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

For acute or short term repeated exposures to fluorides:

- Fluoride absorption from gastro-intestinal tract may be retarded by calcium salts, milk or antacids.
- Fluoride particulates or fume may be absorbed through the respiratory tract with 20-30% deposited at alveolar level.
- Peak serum levels are reached 30 mins. post-exposure; 50% appears in the urine within 24 hours.
- For acute poisoning (endotracheal intubation if inadequate tidal volume), monitor breathing and evaluate/monitor blood pressure and pulse frequently since shock may supervene with little warning. Monitor ECG immediately; watch for arrhythmias and evidence of Q-T prolongation or T-wave changes. Maintain monitor. Treat shock vigorously with isotonic saline (in 5% glucose) to restore blood volume and enhance renal excretion.
- Where evidence of hypocalcaemic or normocalcaemic tetany exists, calcium gluconate (10 ml of a 10% solution) is injected to avoid tachycardia.

BIOLOGICAL EXPOSURE INDEX - BEI

These represent the determinants observed in specimens collected from a healthy worker exposed at the Exposure Standard (ES or TLV):

| Determinant | Index | Sampling Time | Comments |
|---|---|---|---|
| Fluorides in urine | 3 mg/gm creatinine | Prior to shift | B, NS |
| | 10mg/gm creatinine | End of shift | B, NS |

**Continued...**

B: Background levels occur in specimens collected from subjects **NOT** exposed

NS: Non-specific determinant; also observed after exposure to other exposures.

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

- Use dry chemical or CO2. Cover with dry earth, sand or other non-combustible material.

### Special hazards arising from the substrate or mixture

| | |
|---|---|
| **Fire Incompatibility** | None known. |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | ▸ Alert Fire Brigade and tell them location and nature of hazard.<br>▸ Wear breathing apparatus plus protective gloves in the event of a fire.<br>▸ Prevent, by any means available, spillage from entering drains or water courses<br>▸ DO NOT Approach containers suspected to be hot.<br>▸ Cool fire exposed containers with water spray from a protected location.<br>▸ If safe to do so, remove containers from path of fire.<br>▸ Equipment should be thouroughly decontaminated after use. |
| **Fire/Explosion Hazard** | ▸ Non combustible.<br>▸ Not considered a significant fire risk, however containers may burn.<br>Decomposition may produce toxic fumes of:<br>hydrogen fluoride<br>silicon dioxide (SiO2)<br>When aluminium oxide dust is dispersed in air, firefighters should wear protection against inhalation of dust particles, which can also contain hazardous substances from the fire absorbed on the alumina particles.<br>May emit poisonous fumes.<br>May emit corrosive fumes. |
| **HAZCHEM** | Not Applicable |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

See section 8

### Environmental precautions

See section 12

### Methods and material for containment and cleaning up

| | |
|---|---|
| **Minor Spills** | ▸ Clean up all spills immediately.<br>▸ Avoid contact with skin and eyes.<br>▸ Control personal contact with substance, by using protective Equipment.<br>▸ Use dry clean up procedures and avoid generating dust. |
| **Major Spills** | Moderate hazard.<br>▸ **CAUTION**:Advise personnel in area.<br>▸ Control personal contact by wearing protective clothing.<br>▸ Prevent, by any means available, spillage from entering drains or water courses.<br>▸ Recover product wherever possible.<br>▸ **IF DRY:** Use dry clean up procedures and avoid generating dust. Collect residues and place in sealed plastic bags or other containers for disposal. **IF WET:** Vacuum/shovel up and place in labelled containers for disposal. |

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | ▸ Wear protective clothing when risk of exposure occurs.<br>▸ Use in a well-ventilated area.<br>▸ When handling, **DO NOT** eat, drink or smoke.<br>▸ Keep containers securely sealed when not in use.<br>▸ Avoid physical damage to containers.<br>▸ Always wash hands with soap and water after handling.<br>▸ Work clothes should be laundered separately. Launder contaminated clothing before re-use.<br>▸ Use good occupational work practice.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS. |
| **Other information** | ▸ Store in ventilated area.<br>▸ Store in a cool, dry area protected from environmental extremes.<br>▸ Avoid run-off water.<br>▸ Store away from incompatible materials and foodstuff containers.<br>▸ Protect containers against physical damage and check regularly for leaks.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS.<br>For major quantities:<br>▸ Consider storage in bunded areas - ensure storage areas are isolated from sources of community water (including stormwater, ground water, lakes and streams). |

**Continued...**

| | |
|---|---|
| | ▸ Ensure that accidental discharge to air or water is the subject of a contingency disaster management plan. |

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Store in accordance with manufacturer's recommendation and local regulation.<br>▸ Store in segregated and approved area.<br>▸ Store so as to avoid dust generation and dispersal. |
| **Storage incompatibility** | Sodium fluoride:<br>▸ aqueous solutions attack glass and react violently with xenon hexafluoride; are incompatible with sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin<br>▸ reacts with acids forming hydrogen fluoride<br>▸ Contact with acids produces toxic fumes |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

**OCCUPATIONAL EXPOSURE LIMITS (OEL)**

**INGREDIENT DATA**

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | aluminium oxide | Aluminium oxide | 10 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium oxide | a-Alumina (Al2O3) | Not Available | Not Available | Not Available | Not Available |

**EMERGENCY LIMITS**

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| sodium fluoride | Sodium fluoride | 17 mg/m3 | 90 mg/m3 | 1,100 mg/m3 |
| aluminium oxide | Aluminum oxide; (Alumina) | 5.7 mg/m3 | 15 mg/m3 | 25 mg/m3 |
| carbon, non-activated | Carbon; (Graphite, synthetic) | 6 mg/m3 | 16 mg/m3 | 95 mg/m3 |
| calcium fluoride | Calcium fluoride | 15 mg/m3 | 170 mg/m3 | 1,000 mg/m3 |

| Ingredient | Original IDLH | Revised IDLH |
|---|---|---|
| nepheline | Not Available | Not Available |
| silica, fumed | Not Available | Not Available |
| sodium fluoride | 250 mg/m3 | Not Available |
| mullite | Not Available | Not Available |
| aluminium oxide | Not Available | Not Available |
| sodium aluminium fluoride | Not Available | Not Available |
| carbon, non-activated | Not Available | Not Available |
| magnetite | Not Available | Not Available |
| calcium fluoride | 250 mg/m3 | Not Available |

### Exposure controls

| | |
|---|---|
| **Appropriate engineering controls** | Use only with adequate ventilation. If user operations generate dust, fumes, gas, vapor or mist, use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits. Engineering controls may be required to control the primary or secondary risks associated with this product. The engineering controls also need to keep gas, vapor or dust concentrations below any lower explosive limits. Use explosion-proof ventilation Equipment. |
| **Personal protection** | |
| **Eye and face protection** | Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn unless the assessment indicates a higher degree of protection:chemical splash goggles. |
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product. Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. Considering the parameters specified by the glove manufacturer, check during use that the gloves are still retaining their protective properties. It should be noted that the time to breakthrough for any glove material may be different for different glove manufacturers. In the case of mixtures, consisting of several substances, the protection time of the gloves cannot be accurately estimated.<br>Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location. |
| **Body protection** | See Other protection below |
| **Other protection** | Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification. Respirators must be used according to a respiratory protection program to ensure proper fitting, training, and other important spects of use. Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product. |
| **Thermal hazards** | Not Available |

**Continued...**

### Recommended material(s)

**GLOVE SELECTION INDEX**

Glove selection is based on a modified presentation of the:
**"Forsberg Clothing Performance Index".**
The effect(s) of the following substance(s) are taken into account in the ***computer-generated*** selection:
HiCAl-R Clinker Mineraliser

| Material | CPI |
|---|---|
| NATURAL RUBBER | A |
| NEOPRENE | A |
| NITRILE | A |
| PVC | A |

* CPI - Chemwatch Performance Index
A: Best Selection
B: Satisfactory; may degrade after 4 hours continuous immersion
C: Poor to Dangerous Choice for other than short term immersion
**NOTE**: As a series of factors will influence the actual performance of the glove, a final selection must be based on detailed observation. -
* Where the glove is to be used on a short term, casual or infrequent basis, factors such as "feel" or convenience (e.g. disposability), may dictate a choice of gloves which might otherwise be unsuitable following long-term or frequent use. A qualified practitioner should be consulted.

### Respiratory protection

**Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification.**

## SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

### Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Dark |

| | | | |
|---|---|---|---|
| **Physical state** | Solid | **Relative density (Water = 1)** | Not Applicable |
| **Odour** | Ammonia-Like | **Partition coefficient n-octanol / water** | Not Available |
| **Odour threshold** | Not Available | **Auto-ignition temperature (°C)** | Not Applicable |
| **pH (as supplied)** | Not Applicable | **Decomposition temperature** | Not Applicable |
| **Melting point / freezing point (°C)** | Not Applicable | **Viscosity (cSt)** | Not Applicable |
| **Initial boiling point and boiling range (°C)** | Not Applicable | **Molecular weight (g/mol)** | Not Applicable |
| **Flash point (°C)** | Not Applicable | **Taste** | Not Available |
| **Evaporation rate** | Not Available | **Explosive properties** | Not Available |
| **Flammability** | Not Applicable | **Oxidising properties** | Not Available |
| **Upper Explosive Limit (%)** | Not Applicable | **Surface Tension (dyn/cm or mN/m)** | Not Applicable |
| **Lower Explosive Limit (%)** | Not Applicable | **Volatile Component (%vol)** | Negligible |
| **Vapour pressure (kPa)** | Not Applicable | **Gas group** | Not Available |
| **Solubility in water (g/L)** | Immiscible | **pH as a solution (1%)** | Not Applicable |
| **Vapour density (Air = 1)** | Not Applicable | **VOC g/L** | Not Applicable |

## SECTION 10 STABILITY AND REACTIVITY

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | The material is not thought to produce either adverse health effects or irritation of the respiratory tract following inhalation (as classified by EC Directives using animal models). Nevertheless, adverse systemic effects have been produced following exposure of animals by at least one other route and good hygiene practice requires that exposure be kept to a minimum and that suitable control measures be used in an occupational setting. |
| **Ingestion** | Accidental ingestion of the material may be harmful; animal experiments indicate that ingestion of less than 150 gram may be fatal or may produce serious damage to the health of the individual.<br>Acute toxic responses to aluminium are confined to the more soluble forms. |

**Continued...**

| | |
|---|---|
| **Skin Contact** | This material can cause inflammation of the skin on contact in some persons.<br>The material may accentuate any pre-existing dermatitis condition<br>Though considered non-harmful, slight irritation may result from contact because of the abrasive nature of the aluminium oxide particles. Thus it may cause itching and skin reaction and inflammation.<br>Open cuts, abraded or irritated skin should not be exposed to this material |
| **Eye** | This material can cause eye irritation and damage in some persons. |
| **Chronic** | Long-term exposure to the product is not thought to produce chronic effects adverse to the health (as classified by EC Directives using animal models); nevertheless exposure by all routes should be minimised as a matter of course. |

**HiCAI-R Clinker Mineraliser**

| TOXICITY | IRRITATION |

| Oral (rat) LD50: 4250 mg/kg[2] | Not Available |

| | |
|---|---|
| ***Legend:*** | *1. Value obtained from Europe ECHA Registered Substances - Acute toxicity 2.* Value obtained from manufacturer's SDS. Unless otherwise specified data extracted from RTECS - Register of Toxic Effect of chemical Substances* |

| | |
|---|---|
| **NEPHELINE** | No data available No data available |
| **SILICA, FUMED** | For silica amorphous:<br>When experimental animals inhale synthetic amorphous silica (SAS) dust, it dissolves in the lung fluid and is rapidly eliminated. If swallowed, the vast majority of SAS is excreted in the faeces and there is little accumulation in the body. |
| **SODIUM FLUORIDE** | The material may produce moderate eye irritation leading to inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The substance is classified by IARC as Group 3:<br>**NOT** classifiable as to its carcinogenicity to humans.<br>Evidence of carcinogenicity may be inadequate or limited in animal testing. |
| **MULLITE** | No data of toxicological significance identified in literature search. |
| **CARBON, NON-ACTIVATED** | Substance has been investigated as a reproductive effector. |
| **SILICA, FUMED & SODIUM ALUMINIUM FLUORIDE** | No significant acute toxicological data identified in literature search. |
| **SODIUM FLUORIDE & CALCIUM FLUORIDE** | Asthma-like symptoms may continue for months or even years after exposure to the material ends. This may be due to a non-allergic condition known as reactive airways dysfunction syndrome (RADS) which can occur after exposure to high levels of highly irritating compound. |

| calcium fluoride | 7789-75-5, 14542-23-5 |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.
The SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings.

### Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。
IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection
OTV: Odour Threshold Value
BCF: BioConcentration Factors
BEI: Biological Exposure Index

## SECTION 2 HAZARDS IDENTIFICATION

### Classification of the substance or mixture

| | |
|---|---|
| **Poisons Schedule** | S6 |
| **Classification [1]** | Emit Flammable Gases with Water Category 3, Acute Toxicity (Oral) Category 4, Skin Corrosion/Irritation Category 1B, Serious Eye Damage Category 1, Specific target organ toxicity - repeated exposure Category 2, Acute Aquatic Hazard Category 3, Chronic Aquatic Hazard Category 3 |
| ***Legend:*** | *1. Classified by Chemwatch; 2. Classification drawn from HSIS ; 3. Classification drawn from EC Directive 1272/2008 - Annex VI* |

### Label elements

| | |
|---|---|
| **GHS label elements** | |

Continued...

| | |
|---|---|
| SIGNAL WORD | DANGER |

### Hazard statement(s)

| | |
|---|---|
| **H261** | In contact with water releases flammable gases. |
| **H302** | Harmful if swallowed. |
| **H314** | Causes severe skin burns and eye damage. |
| **H373** | May cause damage to organs through prolonged or repeated exposure. |
| **H412** | Harmful to aquatic life with long lasting effects. |
| **AUH014** | Reacts violently with water |
| **AUH029** | Contact with water liberates toxic gas |
| **AUH032** | Contact with acid liberates very toxic gas |

### Precautionary statement(s) Prevention

| | |
|---|---|
| **P231+P232** | Handle under inert gas. Protect from moisture. |
| **P260** | Do not breathe dust/fume/gas/mist/vapours/spray. |
| **P280** | Wear protective gloves/protective clothing/eye protection/face protection. |
| **P270** | Do not eat, drink or smoke when using this product. |
| **P273** | Avoid release to the environment. |

### Precautionary statement(s) Response

| | |
|---|---|
| **P301+P330+P331** | IF SWALLOWED: Rinse mouth. Do NOT induce vomiting. |
| **P303+P361+P353** | IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower. |
| **P305+P351+P338** | IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. |
| **P310** | Immediately call a POISON CENTER or doctor/physician. |
| **P370+P378** | In case of fire: Use alcohol resistant foam or normal protein foam for extinction. |
| **P363** | Wash contaminated clothing before reuse. |
| **P301+P312** | IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell. |
| **P304+P340** | IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. |

### Precautionary statement(s) Storage

| | |
|---|---|
| **P405** | Store locked up. |
| **P402+P404** | Store in a dry place. Store in a closed container. |

### Precautionary statement(s) Disposal

| | |
|---|---|
| **P501** | Dispose of contents/container in accordance with local regulations. |

## SECTION 3 COMPOSITION / INFORMATION ON INGREDIENTS

## SECTION 4 FIRST AID MEASURES

### Description of first aid measures

| | |
|---|---|
| **Eye Contact** | If this product comes in contact with the eyes:<br>▸ Immediately hold eyelids apart and flush the eye continuously with running water.<br>▸ Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.<br>▸ Continue flushing until advised to stop by the Poisons Information Centre or a doctor, or for at least 15 minutes.<br>▸ Transport to hospital or doctor without delay.<br>▸ Removal of contact lenses after an eye injury should only be undertaken by skilled personnel. |
| **Skin Contact** | If skin contact occurs:<br>▸ Immediately remove all contaminated clothing, including footwear.<br>▸ Flush skin and hair with running water (and soap if available).<br>▸ Seek medical attention in event of irritation. |
| **Inhalation** | ▸ If dust is inhaled, remove from contaminated area.<br>▸ Encourage patient to blow nose to ensure clear breathing passages.<br>▸ Ask patient to rinse mouth with water but to not drink water.<br>▸ Seek immediate medical attention.<br>▸ If fumes or combustion products are inhaled remove from contaminated area.<br>▸ Lay patient down. Keep warm and rested.<br>▸ Prostheses such as false teeth, which may block airway, should be removed, where possible, prior to initiating first aid procedures.<br>▸ Apply artificial respiration if not breathing, preferably with a demand valve resuscitator, bag-valve mask device, or pocket mask as trained. Perform CPR if necessary.<br>▸ Transport to hospital, or doctor. |
| **Ingestion** | ▸ If swallowed do **NOT** induce vomiting.<br>▸ If vomiting occurs, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.<br>▸ Observe the patient carefully.<br>▸ Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious.<br>▸ Give water to rinse out mouth, then provide liquid slowly and as much as casualty can comfortably drink.<br>▸ Seek medical advice. |

### Indication of any immediate medical attention and special treatment needed

Treat symptomatically.
For acute or short-term repeated exposures to highly alkaline materials:
- Respiratory stress is uncommon but present occasionally because of soft tissue edema.
- Unless endotracheal intubation can be accomplished under direct vision, cricothyroidotomy or tracheotomy may be necessary.
- Oxygen is given as indicated.
- The presence of shock suggests perforation and mandates an intravenous line and fluid administration.
- Damage due to alkaline corrosives occurs by liquefaction necrosis whereby the saponification of fats and solubilisation of proteins allow deep penetration into the tissue.

Alkalis continue to cause damage after exposure.
INGESTION:
- Milk and water are the preferred diluents

No more than 2 glasses of water should be given to an adult.
- Neutralising agents should never be given since exothermic heat reaction may compound injury.

* Catharsis and emesis are absolutely contra-indicated.
* Activated charcoal does not absorb alkali.
* Gastric lavage should not be used.

Supportive care involves the following:
- Withhold oral feedings initially.
- If endoscopy confirms transmucosal injury start steroids only within the first 48 hours.
- Carefully evaluate the amount of tissue necrosis before assessing the need for surgical intervention.
- Patients should be instructed to seek medical attention whenever they develop difficulty in swallowing (dysphagia).

SKIN AND EYE:
- Injury should be irrigated for 20-30 minutes.

Eye injuries require saline. [Ellenhorn & Barceloux: Medical Toxicology]

## SECTION 5 FIREFIGHTING MEASURES

### Extinguishing media

- Dry sand.
- Dry chemical powder.
- **DO NOT** use halogenated fire extinguishing agents.
- **DO NOT** use water or halogens on dust fires.

**Continued...**

|Small sodium fires can occur in stored material. Extinguishing material for such|fires should not be water.

### Special hazards arising from the substrate or mixture

| | |
|---|---|
| **Fire Incompatibility** | ‣ Avoid contamination with oxidising agents i.e. nitrates, oxidising acids, chlorine bleaches, pool chlorine etc. as ignition may result<br>‣ Contact with water liberates highly flammable gases<br>‣ Reacts with water or steam to produce toxic and corrosive fumes |

### Advice for firefighters

| | |
|---|---|
| **Fire Fighting** | ‣ Alert Fire Brigade and tell them location and nature of hazard.<br>‣ May be violently or explosively reactive.<br>‣ Wear full body protective clothing with breathing apparatus.<br>‣ Prevent, by any means available, spillage from entering drains or water course.<br>‣ Consider evacuation (or protect in place).<br>‣ **DO NOT** use water on fires.<br>‣ Avoid spraying water onto liquid pools.<br>‣ **Do not** approach containers suspected to be hot.<br>‣ If safe to do so, remove containers from path of fire.<br>‣ Equipment should be thoroughly decontaminated after use. |
| **Fire/Explosion Hazard** | ‣ Combustible.<br>‣ Slight fire hazard when exposed to heat or flame.<br>‣ Heating may cause expansion or decomposition leading to violent rupture of containers.<br>‣ On combustion, may emit toxic fumes of carbon monoxide (CO).<br>‣ May emit acrid smoke.<br>‣ Mists containing combustible materials may be explosive.<br>Combustion products include:<br>,<br>carbon dioxide ($CO_2$)<br>,<br>hydrogen fluoride<br>,<br>sulfur oxides (SOx)<br>Avoid creating dust - may present dust explosion hazard. Dry dust can be electrostatically charged by turbulence, pneumatic transport, pouring, in exhaust ducts and during transport. Build-up of electrostatic charge may be prevented by grounding.<br>May emit poisonous fumes.<br>May emit corrosive fumes. |
| **HAZCHEM** | 4W |

## SECTION 6 ACCIDENTAL RELEASE MEASURES

### Personal precautions, protective equipment and emergency procedures

See section 8

### Environmental precautions

See section 12

### Methods and material for containment and cleaning up

| | |
|---|---|
| **Minor Spills** | ‣ Remove all ignition sources.<br>‣ Clean up all spills immediately.<br>‣ Avoid contact with skin and eyes.<br>‣ Control personal contact with the substance, by using protective equipment.<br>‣ Use dry clean up procedures and avoid generating dust.<br>‣ Place in a suitable, labelled container for waste disposal. |
| **Major Spills** | ‣ Clear area of personnel and move upwind.<br>‣ Alert Fire Brigade and tell them location and nature of hazard.<br>‣ Wear full body protective clothing with breathing apparatus.<br>‣ Prevent, by any means available, spillage from entering drains or water course.<br>‣ Consider evacuation (or protect in place).<br>‣ Stop leak if safe to do so.<br>‣ Contain spill with sand, earth or vermiculite.<br>‣ Collect recoverable product into labelled containers for recycling.<br>‣ Neutralise/decontaminate residue (see Section 13 for specific agent).<br>‣ Collect solid residues and seal in labelled drums for disposal.<br>‣ Wash area and prevent runoff into drains.<br>‣ After clean up operations, decontaminate and launder all protective clothing and equipment before storing and re-using.<br>‣ If contamination of drains or waterways occurs, advise emergency services. |

**Continued...**

Personal Protective Equipment advice is contained in Section 8 of the SDS.

## SECTION 7 HANDLING AND STORAGE

### Precautions for safe handling

| | |
|---|---|
| **Safe handling** | Remove all ignition sources.<br>▸ Limit all unnecessary personal contact.<br>▸ Wear protective clothing when risk of exposure occurs.<br>▸ Use in a well-ventilated area.<br>▸ Avoid contact with incompatible materials.<br>▸ When handling, **DO NOT** eat, drink or smoke.<br>▸ Keep containers securely sealed when not in use.<br>▸ Avoid physical damage to containers.<br>▸ Always wash hands with soap and water after handling.<br>▸ Work clothes should be laundered separately.<br>▸ Use good occupational work practice.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS.<br>▸ Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions are maintained. |
| **Other information** | ▸ Keep dry.<br>▸ Store under cover.<br>▸ Store in a well ventilated area.<br>▸ Store away from sources of heat or ignition.<br>▸ Observe manufacturer's storage and handling recommendations contained within this SDS. |

### Conditions for safe storage, including any incompatibilities

| | |
|---|---|
| **Suitable container** | ▸ Polyethylene or polypropylene container.<br>▸ Check all containers are clearly labelled and free from leaks. |
| **Storage incompatibility** | ▸ Contact with acids produces toxic fumes<br>Avoid storage with oxidisers<br><br>Contact with water liberates extremely flammable gases.<br>▸ Avoid any contamination of this material as it is very reactive and any contamination is potentially hazardous |

## SECTION 8 EXPOSURE CONTROLS / PERSONAL PROTECTION

### Control parameters

#### OCCUPATIONAL EXPOSURE LIMITS (OEL)

#### INGREDIENT DATA

| Source | Ingredient | Material name | TWA | STEL | Peak | Notes |
|---|---|---|---|---|---|---|
| Australia Exposure Standards | carbon, non-activated | Fume (thermally generated) (respirable dust) | 2 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | silica crystalline - quartz | Silica - Crystalline: Quartz (respirable dust) / Quartz (respirable dust) | 0.1 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | sodium hydroxide | Sodium hydroxide | Not Available | Not Available | 2 mg/m3 | Not Available |
| Australia Exposure Standards | sodium fluoride | Fluorides (as F) | 2.5 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | sodium aluminium fluoride | Fluorides (as F) | 2.5 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | calcium fluoride | Fluorides (as F) | 2.5 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | calcium oxide | Calcium oxide | 2 mg/m3 | Not Available | Not Available | Not Available |
| Australia Exposure Standards | aluminium oxide | Aluminium oxide | 10 mg/m3 | Not Available | Not Available | Not Available |

#### EMERGENCY LIMITS

| Ingredient | Material name | TEEL-1 | TEEL-2 | TEEL-3 |
|---|---|---|---|---|
| carbon, non-activated | Carbon; (Graphite, synthetic) | 6 mg/m3 | 16 mg/m3 | 95 mg/m3 |
| silica crystalline - quartz | Silica, crystalline-quartz; (Silicon dioxide) | 0.075 mg/m3 | 33 mg/m3 | 200 mg/m3 |

| calcium oxide | Unknown mg/m3 / Unknown ppm | 25 mg/m3 |
| aluminium oxide | Not Available | Not Available |
| free cyanide | Not Available | Not Available |

**MATERIAL DATA**

## Exposure controls

**Appropriate engineering controls**

Engineering controls are used to remove a hazard or place a barrier between the worker and the hazard. Well-designed engineering controls can be highly effective in protecting workers and will typically be independent of worker interactions to provide this high level of protection.
The basic types of engineering controls are:
Process controls which involve changing the way a job activity or process is done to reduce the risk.
Enclosure and/or isolation of emission source which keeps a selected hazard "physically" away from the worker and ventilation that strategically "adds" and "removes" air in the work environment. Ventilation can remove or dilute an air contaminant if designed properly. The design of a ventilation system must match the particular process and chemical or contaminant in use.
Employers may need to use multiple types of controls to prevent employee overexposure.

- Local exhaust ventilation is required where solids are handled as powders or crystals; even when particulates are relatively large, a certain proportion will be powdered by mutual friction.
- Exhaust ventilation should be designed to prevent accumulation and recirculation of particulates in the workplace.
- If in spite of local exhaust an adverse concentration of the substance in air could occur, respiratory protection should be considered. Such protection might consist of:

(a): particle dust respirators, if necessary, combined with an absorption cartridge;
(b): filter respirators with absorption cartridge or canister of the right type;
(c): fresh-air hoods or masks

- Build-up of electrostatic charge on the dust particle, may be prevented by bonding and grounding.
- Powder handling equipment such as dust collectors, dryers and mills may require additional protection measures such as explosion venting.

Air contaminants generated in the workplace possess varying "escape" velocities which, in turn, determine the "capture velocities" of fresh circulating air required to efficiently remove the contaminant.

| Type of Contaminant: | Air Speed: |
|---|---|
| direct spray, spray painting in shallow booths, drum filling, conveyer loading, crusher dusts, gas discharge (active generation into zone of rapid air motion) | 1-2.5 m/s (200-500 f/min.) |
| grinding, abrasive blasting, tumbling, high speed wheel generated dusts (released at high initial velocity into zone of very high rapid air motion). | 2.5-10 m/s (500-2000 f/min.) |

Within each range the appropriate value depends on:

| Lower end of the range | Upper end of the range |
|---|---|
| 1: Room air currents minimal or favourable to capture | 1: Disturbing room air currents |
| 2: Contaminants of low toxicity or of nuisance value only | 2: Contaminants of high toxicity |
| 3: Intermittent, low production. | 3: High production, heavy use |
| 4: Large hood or large air mass in motion | 4: Small hood-local control only |

Simple theory shows that air velocity falls rapidly with distance away from the opening of a simple extraction pipe. Velocity generally decreases with the square of distance from the extraction point (in simple cases). Therefore the air speed at the extraction point should be adjusted, accordingly, after reference to distance from the contaminating source. The air velocity at the extraction fan, for example, should be a minimum of 4-10 m/s (800-2000 f/min) for extraction of crusher dusts

**Continued...**

| | |
|---|---|
| | generated 2 metres distant from the extraction point. Other mechanical considerations, producing performance deficits within the extraction apparatus, make it essential that theoretical air velocities are multiplied by factors of 10 or more when extraction systems are installed or used. |
| **Personal protection** |  |
| **Eye and face protection** | ▸ Chemical goggles.<br>▸ Full face shield may be required for supplementary but never for primary protection of eyes.<br>▸ Contact lenses may pose a special hazard; soft contact lenses may absorb and concentrate irritants. A written policy document, describing the wearing of lenses or restrictions on use, should be created for each workplace or task. This should include a review of lens absorption and adsorption for the class of chemicals in use and an account of injury experience. Medical and first-aid personnel should be trained in their removal and suitable equipment should be readily available. In the event of chemical exposure, begin eye irrigation immediately and remove contact lens as soon as practicable. Lens should be removed at the first signs of eye redness or irritation - lens should be removed in a clean environment only after workers have washed hands thoroughly. [CDC NIOSH Current Intelligence Bulletin 59], [AS/NZS 1336 or national equivalent] |
| **Skin protection** | See Hand protection below |
| **Hands/feet protection** | Experience indicates that the following polymers are suitable as glove materials for protection against undissolved, dry solids, where abrasive particles are not present.<br>▸ polychloroprene.<br>▸ nitrile rubber.<br>▸ butyl rubber.<br>▸ fluorocaoutchouc.<br>▸ polyvinyl chloride.<br>Gloves should be examined for wear and/ or degradation constantly.<br>The selection of suitable gloves does not only depend on the material, but also on further marks of quality which vary from manufacturer to manufacturer. Where the chemical is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application.<br>The exact break through time for substances has to be obtained from the manufacturer of the protective gloves and has to be observed when making a final choice.<br>Personal hygiene is a key element of effective hand care. Gloves must only be worn on clean hands. After using gloves, hands should be washed and dried thoroughly. Application of a non-perfumed moisturizer is recommended.<br>Suitability and durability of glove type is dependent on usage. Important factors in the selection of gloves include:<br>· frequency and duration of contact,<br>· chemical resistance of glove material,<br>· glove thickness and<br>· dexterity<br>Select gloves tested to a relevant standard (e.g. Europe EN 374, US F739, AS/NZS 2161.1 or national equivalent).<br>· When prolonged or frequently repeated contact may occur, a glove with a protection class of 5 or higher (breakthrough time greater than 240 minutes according to EN 374, AS/NZS 2161.10.1 or national equivalent) is recommended.<br>· When only brief contact is expected, a glove with a protection class of 3 or higher (breakthrough time greater than 60 minutes according to EN 374, AS/NZS 2161.10.1 or national equivalent) is recommended.<br>· Some glove polymer types are less affected by movement and this should be taken into account when considering gloves for long-term use.<br>· Contaminated gloves should be replaced.<br>For general applications, gloves with a thickness typically greater than 0.35 mm, are recommended.<br>It should be emphasised that glove thickness is not necessarily a good predictor of glove resistance to a specific chemical, as the permeation efficiency of the glove will be dependent on the exact composition of the glove material. Therefore, glove selection should also be based on consideration of the task requirements and knowledge of breakthrough times.<br>Glove thickness may also vary depending on the glove manufacturer, the glove type and the glove model. Therefore, the manufacturers' technical data should always be taken into account to ensure selection of the most appropriate glove for the task.<br>Note: Depending on the activity being conducted, gloves of varying thickness may be required for specific tasks. For example:<br>· Thinner gloves (down to 0.1 mm or less) may be required where a high degree of manual dexterity is needed. However, these gloves are only likely to give short duration protection and would normally be just for single use applications, then disposed of.<br>· Thicker gloves (up to 3 mm or more) may be required where there is a mechanical (as well as a chemical) risk i.e. where there is abrasion or puncture potential<br>Gloves must only be worn on clean hands. After using gloves, hands should be washed and dried thoroughly. Application of a non-perfumed moisturiser is recommended. |
| **Body protection** | See Other protection below |
| **Other protection** | ▸ Overalls.<br>▸ P.V.C. apron.<br>▸ Barrier cream.<br>▸ Skin cleansing cream.<br>▸ Eye wash unit. |

| **Thermal hazards** | Not Available |

## Recommended material(s)

**GLOVE SELECTION INDEX**

Glove selection is based on a modified presentation of the:
***"Forsberg Clothing Performance Index".***
The effect(s) of the following substance(s) are taken into account in the ***computer-generated*** selection:
Tomago Spent Potlining Carbon Byproduct

| Material | CPI |
|---|---|
| BUTYL | C |
| NAT+NEOPR+NITRILE | C |
| NATURAL RUBBER | C |
| NATURAL+NEOPRENE | C |
| NEOPRENE | C |
| NEOPRENE/NATURAL | C |
| NITRILE | C |
| NITRILE+PVC | C |
| PE | C |
| PE/EVAL/PE | C |
| PVC | C |
| SARANEX-23 | C |
| SARANEX-23 2-PLY | C |
| TEFLON | C |
| VITON/CHLOROBUTYL | C |
| ##sodium | fluoride |

* CPI - Chemwatch Performance Index
A: Best Selection
B: Satisfactory; may degrade after 4 hours continuous immersion
C: Poor to Dangerous Choice for other than short term immersion
**NOTE**: As a series of factors will influence the actual performance of the glove, a final selection must be based on detailed observation. -
* Where the glove is to be used on a short term, casual or infrequent basis, factors such as "feel" or convenience (e.g. disposability), may dictate a choice of gloves which might otherwise be unsuitable following long-term or frequent use. A qualified practitioner should be consulted.

## Respiratory protection

Particulate. (AS/NZS 1716 & 1715, EN 143:000 & 149:001, ANSI Z88 or national equivalent)

Where the concentration of gas/particulates in the breathing zone, approaches or exceeds the "Exposure Standard" (or ES), respiratory protection is required.
Degree of protection varies with both face-piece and Class of filter; the nature of protection varies with Type of filter.

| Required Minimum Protection Factor | Half-Face Respirator | Full-Face Respirator | Powered Air Respirator |
|---|---|---|---|
| up to 10 x ES | -AUS P2 | - | -PAPR-AUS / Class 1 P2 |
| up to 50 x ES | - | -AUS / Class 1 P2 | - |
| up to 100 x ES | - | -2 P2 | -PAPR-2 P2 ^ |

^ - Full-face
A(All classes) = Organic vapours, B AUS or B1 = Acid gasses, B2 = Acid gas or hydrogen cyanide(HCN), B3 = Acid gas or hydrogen cyanide(HCN), E = Sulfur dioxide(SO2), G = Agricultural chemicals, K = Ammonia(NH3), Hg = Mercury, NO = Oxides of nitrogen, MB = Methyl bromide, AX = Low boiling point organic compounds(below 65 degC)

# SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

## Information on basic physical and chemical properties

| | |
|---|---|
| **Appearance** | Black carbonaceous solid with varying granulometry and white salt encrustment; does not mix with water. Hygroscopic material, with potential to generate gases when in contact with moisture. |

| | | | |
|---|---|---|---|
| **Physical state** | Solid | **Relative density (Water = 1)** | 2.0-2.5 |
| **Odour** | Not Available | **Partition coefficient n-octanol / water** | Not Available |
| **Odour threshold** | Not Available | **Auto-ignition temperature (°C)** | Not Available |
| **pH (as supplied)** | Not Applicable | **Decomposition temperature** | Not Available |
| **Melting point / freezing point (°C)** | Not Available | **Viscosity (cSt)** | Not Applicable |
| **Initial boiling point and boiling range (°C)** | Not Applicable | **Molecular weight (g/mol)** | Not Applicable |
| **Flash point (°C)** | Not Applicable | **Taste** | Not Available |
| **Evaporation rate** | Not Applicable | **Explosive properties** | Not Available |

**Continued...**

| | | | |
|---|---|---|---|
| **Flammability** | Not Applicable | **Oxidising properties** | Not Available |
| **Upper Explosive Limit (%)** | Not Available | **Surface Tension (dyn/cm or mN/m)** | Not Applicable |
| **Lower Explosive Limit (%)** | Not Available | **Volatile Component (%vol)** | Not Applicable |
| **Vapour pressure (kPa)** | Not Available | **Gas group** | Not Available |
| **Solubility in water (g/L)** | Immiscible | **pH as a solution (1%)** | Not Applicable |
| **Vapour density (Air = 1)** | Not Applicable | **VOC g/L** | Not Available |

## SECTION 10 STABILITY AND REACTIVITY

| | |
|---|---|
| **Reactivity** | See section 7 |
| **Chemical stability** | ▸ Unstable in the presence of incompatible materials.<br>▸ Product is considered stable.<br>▸ Hazardous polymerisation will not occur. |
| **Possibility of hazardous reactions** | See section 7 |
| **Conditions to avoid** | See section 7 |
| **Incompatible materials** | See section 7 |
| **Hazardous decomposition products** | See section 5 |

## SECTION 11 TOXICOLOGICAL INFORMATION

### Information on toxicological effects

| | |
|---|---|
| **Inhaled** | Inhalation of vapours or aerosols (mists, fumes), generated by the material during the course of normal handling, may be damaging to the health of the individual.<br>Inhalation of alkaline corrosives may produce irritation of the respiratory tract with coughing, choking, pain and mucous membrane damage. Pulmonary oedema may develop in more severe cases; this may be immediate or in most cases following a latent period of 5-72 hours. Symptoms may include a tightness in the chest, dyspnoea, frothy sputum, cyanosis and dizziness. Findings may include hypotension, a weak and rapid pulse and moist rales.<br>Effects on lungs are significantly enhanced in the presence of respirable particles. Overexposure to respirable dust may produce wheezing, coughing and breathing difficulties leading to or symptomatic of impaired respiratory function. |
| **Ingestion** | Accidental ingestion of the material may be harmful; animal experiments indicate that ingestion of less than 150 gram may be fatal or may produce serious damage to the health of the individual.<br>The material can produce chemical burns within the oral cavity and gastrointestinal tract following ingestion.<br>Ingestion of alkaline corrosives may produce immediate pain, and circumoral burns. Mucous membrane corrosive damage is characterised by a white appearance and soapy feel; this may then become brown, oedematous and ulcerated. Profuse salivation with an inability to swallow or speak may also result. Even where there is limited or no evidence of chemical burns, both the oesophagus and stomach may experience a burning pain; vomiting and diarrhoea may follow. The vomitus may be thick and may be slimy (mucous) and may eventually contain blood and shreds of mucosa. Epiglottal oedema may result in respiratory distress and asphyxia. Marked hypotension is symptomatic of shock; a weak and rapid pulse, shallow respiration and clammy skin may also be evident. Circulatory collapse may occur and, if uncorrected, may produce renal failure.<br>Severe exposures may result in oesophageal or gastric perforation accompanied by mediastinitis, substernal pain, peritonitis, abdominal rigidity and fever. Although oesophageal, gastric or pyloric stricture may be evident initially, these may occur after weeks or even months and years. Death may be quick and results from asphyxia, circulatory collapse or aspiration of even minute amounts. Death may also be delayed as a result of perforation, pneumonia or the effects of stricture formation.<br>Fluoride is a general protoplasmic poison which appears to produce at least four major functional derangements; (1) enzyme inhibition, (2) hypocalcaemia, (3) cardiovascular collapse and (4) specific organ damage.<br>Hypocalcaemia which leads to severe reductions in plasma levels of both total calcium and ionic calcium, may appear several hours after exposure producing painful and involuntary muscular contractions (tetany) initially of the extremities (carpopedal spasm, twitching of limb muscles, laryngo-spasm, cardiospasm etc). Cardiovascular collapse is probably the principal cause of death in acute fluoride poisoning with sinus tachycardia the commonest cardiac finding and serious cardiac arrhythmias also common. Poisonings also cause major adverse effects on the brain and kidneys.<br>Toxic effects may include headache, excessive salivation, rapid movements of the eyeball (nystagmus) and dilated pupils. Convulsions may occur but lethargy, stupor and coma are more common. Renal pathology (acute congestion) has been described in human casualties. |
| **Skin Contact** | The material can produce chemical burns following direct contact with the skin.<br>Toxic effects may result from skin absorption<br>The skin is readily penetrated by the fluoride ion causing liquefaction necrosis of the soft tissues and decalcification and corrosion of bone. Healing is delayed and necrotic changes may continue to occur and spread beneath a layer of tough |

**Continued...**

| | |
|---|---|
| | coagulated skin.<br>Percutaneous absorption of pure liquefied hydrogen fluoride gas produced severe hypocalcaemia, multiple attacks of ventricular fibrillation, and death 9.5 hours after exposure. Skin contact with hydrogen fluoride or solutions containing more than 30 percent hydrogen fluoride produces immediate pain; reactions to more dilute solutions may be delayed for many hours. The accompanying pain is excruciating and persistent due to delayed healing.<br>Entry into the blood-stream through, for example, cuts, abrasions, puncture wounds or lesions, may produce systemic injury with harmful effects. Examine the skin prior to the use of the material and ensure that any external damage is suitably protected. |
| **Eye** | The material can produce chemical burns to the eye following direct contact. Vapours or mists may be extremely irritating. |
| **Chronic** | Repeated or prolonged exposure to corrosives may result in the erosion of teeth, inflammatory and ulcerative changes in the mouth and necrosis (rarely) of the jaw. Bronchial irritation, with cough, and frequent attacks of bronchial pneumonia may ensue. Gastrointestinal disturbances may also occur. Chronic exposures may result in dermatitis and/or conjunctivitis.<br>Long term exposure to vapour or dust with inorganic fluorides may result in fluorosis, with rheumatic symptoms, stiff joints, mottling of tooth enamel. Other signs may include nausea, vomiting, anorexia, diarrhoea or constipation, weight loss, anaemia, weakness and general ill-health. Polyuria and polydipsia may also occur. Exfoliative dermatitis, atopic dermatitis, stomatitis, gastrointestinal and respiratory allergy, and on occasions, central nervous system involvement have all been described. |

| | |
|---|---|
| **CARBON, NON-ACTIVATED** | Substance has been investigated as a reproductive effector. |
| **SILICA CRYSTALLINE - QUARTZ** | **WARNING:** For inhalation exposure ONLY: This substance has been classified by the IARC as Group 1: **CARCINOGENIC TO HUMANS**<br><br>The International Agency for Research on Cancer (IARC) has classified occupational exposures to **respirable** (<5 um) |

**Continued...**

| | |
|---|---|
| | crystalline silica as being carcinogenic to humans . This classification is based on what IARC considered sufficient evidence from epidemiological studies of humans for the carcinogenicity of inhaled silica in the forms of quartz and cristobalite.<br>Crystalline silica is also known to cause silicosis, a non-cancerous lung disease.<br>Intermittent exposure produces; focal fibrosis, (pneumoconiosis), cough, dyspnoea, liver tumours.<br><br>* Millions of particles per cubic foot (based on impinger samples counted by light field techniques).<br>NOTE : the physical nature of quartz in the product determines whether it is likely to present a chronic health problem. To be a hazard the material must enter the breathing zone as respirable particles. |
| **SODIUM HYDROXIDE** | The material may produce severe irritation to the eye causing pronounced inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The material may produce severe skin irritation after prolonged or repeated exposure, and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterised by skin redness (erythema) thickening of the epidermis.<br>Histologically there may be intercellular oedema of the spongy layer (spongiosis) and intracellular oedema of the epidermis.<br>Prolonged contact is unlikely, given the severity of response, but repeated exposures may produce severe ulceration. |
| **SODIUM FLUORIDE** | The material may produce moderate eye irritation leading to inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.<br>The substance is classified by IARC as Group 3:<br>**NOT** classifiable as to its carcinogenicity to humans.<br>Evidence of carcinogenicity may be inadequate or limited in animal testing. |
| **SODIUM HYDROXIDE & SODIUM FLUORIDE & CALCIUM FLUORIDE & CALCIUM OXIDE** | Asthma-like symptoms may continue for months or even years after exposure to the material ceases. This may be due to a non-allergenic condition known as reactive airways dysfunction syndrome (RADS) which can occur following exposure to high levels of highly irritating compound. Key criteria for the diagnosis of RADS include the absence of preceding respiratory disease, in a non-atopic individual, with abrupt onset of persistent asthma-like symptoms within minutes to hours of a documented exposure to the irritant. A reversible airflow pattern, on spirometry, with the presence of moderate to severe bronchial hyperreactivity on methacholine challenge testing and the lack of minimal lymphocytic inflammation, without eosinophilia, have also been included in the criteria for diagnosis of RADS. RADS (or asthma) following an irritating inhalation is an infrequent disorder with rates related to the concentration of and duration of exposure to the irritating substance.<br>Industrial bronchitis, on the other hand, is a disorder that occurs as result of exposure due to high concentrations of irritating substance (often particulate in nature) and is completely reversible after exposure ceases. The disorder is characterised by dyspnea, cough and mucus production. |
| **SODIUM ALUMINIUM FLUORIDE & ALUMINIUM OXIDE** | No significant acute toxicological data identified in literature search. |

Classification of the preparation and its individual components has drawn on official and authoritative sources as well as independent review by the Chemwatch Classification committee using available literature references.

The SDS is a Hazard Communication tool and should be used to assist in the Risk Assessment. Many factors determine whether the reported Hazards are Risks in the workplace or other settings. Risks may be determined by reference to Exposures Scenarios. Scale of use, frequency of use and current or available engineering controls must be considered.

## Definitions and abbreviations

PC—TWA: Permissible Concentration-Time Weighted Average
PC—STEL: Permissible Concentration-Short Term Exposure Limit
IARC: International Agency for Research on Cancer
ACGIH: American Conference of Governmental Industrial Hygienists
STEL: Short Term Exposure Limit
TEEL: Temporary Emergency Exposure Limit。
IDLH: Immediately Dangerous to Life or Health Concentrations
OSF: Odour Safety Factor
NOAEL :No Observed Adverse Effect Level
LOAEL: Lowest Observed Adverse Effect Level
TLV: Threshold Limit Value
LOD: Limit Of Detection
OTV: Odour Threshold Value
BCF: BioConcentration Factors
BEI: Biological Exposure Index

## Executive summary

In March 2016, the Department of the Environment and Energy (DoEE) engaged Randell Environmental Consulting (REC) in association with Ascend Waste and Environment to complete the *Spent Pot Lining (SPL) project (feasibility of an agreement based approach to clear stockpiles).*

SPL is a waste material generated from aluminium smelters, of which there are four in current operation in Australia and two recently closed down.

Aluminium smelting is the extraction of aluminium metal from aluminium oxide (also known as alumina). The process takes place in electrolytic cells that are known as 'pots'[1]. The photo below shows one of Australia's largest 'potlines' at Boyne Smelters Limited in Qld. As illustrated below each smelter has a large number of pots to maintain – the higher the number of pots the higher the smelter's aluminium production.

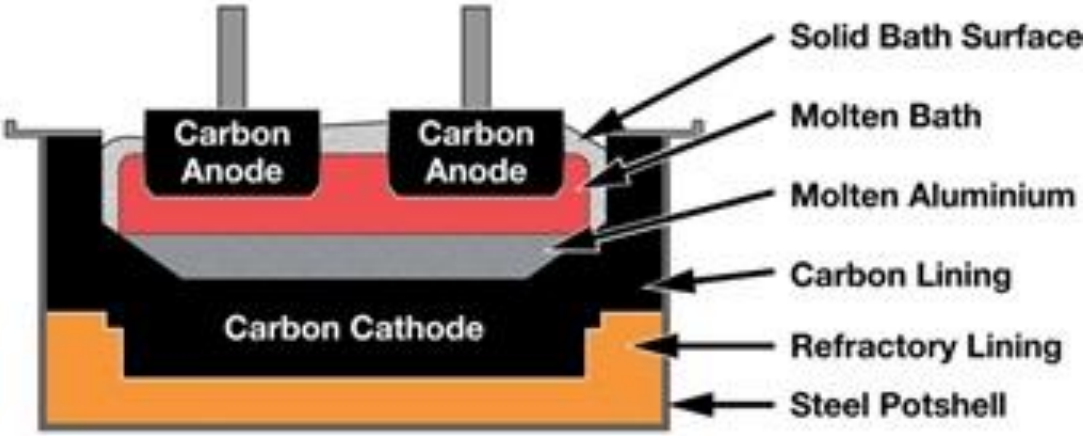
**Figure E1 Aluminium smelter 'pot line' at Boyne Smelters Limited Qld**

*Source: http://sales.riotintoaluminium.com/freedom.aspx?pid=356*

A cross section of a pot is provided in Figure E2 which illustrates that pots are made up of a steel potshell with two linings, an outer insulating or refractory lining and an inner carbon lining that acts as the cathode. The pots also include a carbon based anode which is consumed during the pot operation, but can be replaced before the pot (cathode) reaches the end of its life.

[1] Sometimes referred to as cells, **hence SPL is often referred to as SCL – they are the same thing.**

**Figure E2 Cross section of an aluminium smelting pot**



*Source: http://www.regainmaterials.com/aluminium-smelting-industry/aluminium-production-process*

JOM 2013 explains "the lining, during operation of the cells, is subject to strong reducing conditions and fails after 5-8 years by a variety of mechanisms depending on how the cell was constructed, designed and operated" (page 1441).

When the pot lining fails – spent pot lining waste is generated.

The pot linings are removed by being broken up. The contaminated carbon lining material that is removed is referred to as **first cut SPL.** The contaminated refractory lining material is referred to as **second cut SPL.**

As the SPL is removed it breaks up into different sized pieces ranging from large blocks to fine granular pieces. Some smelters keep the first and second cut SPL separate, other do not and the SPL is removed as one 'cut'. The photos below illustrate the SPL removal process.

**Figure E3 SPL removal and a pile of SPL (both first and second cut)**

*Source: http://www.hydro.com/en/Press-room/News/Archive/2013/From-waste-to-resource/*

During the operation of the pots, substances, including fluorides, cyanides and aluminium are absorbed into **both** cell linings.

Both first and second cut SPL are hazardous waste due to:

- toxicity – leachable fluoride and cyanide compounds, with fluoride levels often around 10 parts per hundred (%)
- corrosiveness – high pH due to the presence of alkali metals and oxides

- reactivity with water – producing toxic, explosive, and inflammable gases.[2]

## E1 Project scope

DoEE provided a letter of introduction for project stakeholders that outlined the project scope as follows:

*"The project will assess the feasibility of using an agreement between industry and governments to clear the stockpiles of spent pot liner (SPL) present in Queensland, New South Wales, Victoria and Tasmania, over a ten year or similar period. The project aims to determine the feasibility of such an agreement approach, and if feasible, what might be required to address the circumstances of the different SPL stockpiles across the jurisdictions."*

This project is **not** aiming to draft any industry-government agreements. It aims to understand if it is possible for agreements to be developed that would result in a drawdown of SPL stockpiles over a period of around 10 years.

This report is intended for publication on the DoEE website. Information that has been identified as confidential or commercial-in-confidence information is either not included in this report or has been redacted (see red blocks of text).

## E2 Project background and context

In 2015 DoEE commissioned a study of hazardous waste arisings and infrastructure capacity in Australia called the *Hazardous waste infrastructure needs and capacity assessment*[3].

The study identified that a significant SPL stockpile had accumulated in Australia and concluded the following:

> *"The storage of large quantities of spent potlining from aluminium smelting should be a social concern, especially given the recent decline of this industry. The three current operators able to process this waste report sufficient capacity to process the stockpile over a 10-15 year period. A mismatch between demand and capacity could cause inappropriate treatment or demand for exports. A nationally coordinated negotiation with the industry is recommended.*
>
> *Recommendation 6: DoEE should consult with the aluminium industry and NSW, Vic, Qld, Tas State Governments to develop a nationally agreed approach to the management of spent potlining stockpiles that ensures their eventual removal and ongoing recovery or treatment."* Page xxi.

This project responds in part to these recommendations.

Environmental legislation administered by the Australian Government and State Government environmental regulators does not support the long term stockpiling of hazardous wastes onsite where it poses ongoing potential risks. The short term storage of SPL in suitable shedding onsite may

[2] Source: JOM2013
[3] Available at: https://www.environment.gov.au/protection/publications/hazardous-waste-infrastructure-needs-capacity-assessment

be appropriate; however, onsite stockpiling in sheds is not a long term solution for SPL management, where the SPL remains exposed to risks such as extreme weather events.

The Australian Government, therefore, seeks to understand if it is feasible to use an agreement based approach with the aluminium industry stakeholders that will result in a plan to drawdown the Australian SPL stockpile over the next 10 years.

## E3 Aluminium production and new SPL arisings

Australia's operational and closed aluminium smelters sites are summarised in the table below.

**Table E1: Australian aluminium smelters operational and closed**

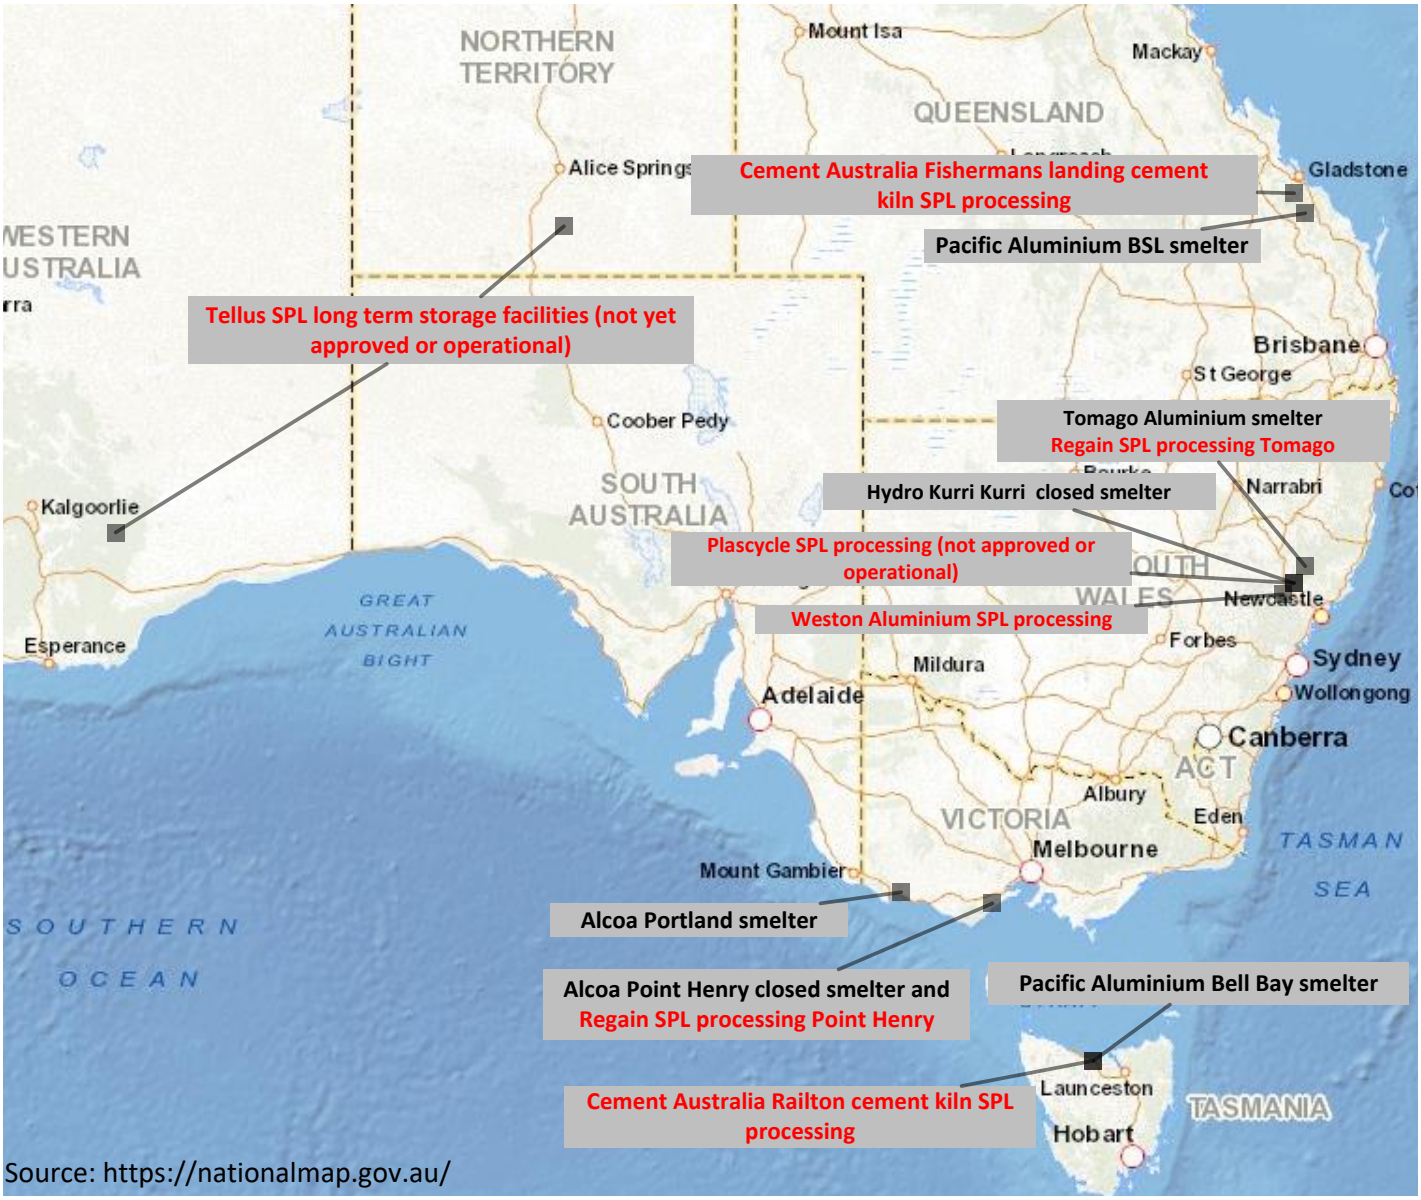
| State | Majority owner | Common site name | Production began | Status | Smelter location | Al production (t/year) |
|---|---|---|---|---|---|---|
| **NSW** | Hydro | Hydro Kurri Kurri | 1969 | Closed | Kurri Kurri | NA (180,000) |
| | Tomago Aluminium | Tomago | 1983 | Operational | Tomago | 590,000 |
| **Qld** | Pacific Aluminium | BSL (Boyne Smelters Limited) | 1982 | Operational | Boyne Island | >570,000 |
| **Vic** | Alcoa | Portland | 1986 | Operational | Portland | 304,000 |
| | Alcoa | Point Henry | 1963 | Closed | Point Henry | NA (192,000) |
| **Tas** | Pacific Aluminium | Bell Bay | 1955 | Operational | Bell Bay | 180,000 |
| | | | | | **Total:** | **~1,650,000** |

*Note: production tonnages for closed sites (in brackets) refers to production in year before closure.*

Australia is currently producing about 1.65 Mt of aluminium per annum. Based on the JOM 2013 typical figure of 22kg SPL per tonne of aluminium production, it can be estimated that Australia is currently generating about **36,000 tonnes of SPL per annum**.

Figure E4 illustrates the locations of Australia's currently operating and closed aluminium smelters. It also includes the locations of the Australian SPL waste management providers (WMPs) that are discussed in the report main body, Section 6.

**Figure E4 Map of Australian aluminium smelters and SPL management facilities**



Source: https://nationalmap.gov.au/

## E4 Australia's SPL stockpile profile

Australia has a significant stockpile of SPL with a total of around **700,000 tonnes** of SPL in either above ground or below ground storages (landfills) around Australia.[4]

Just under half of Australia's SPL stockpile (about 310,000 tonnes) is stored in above ground stockpiles. Interestingly there is a higher proportion of 1st cut SPL (about 114,000 tonnes) than 2nd cut SPL (about 74,000 tonnes) in these stockpiles. The high carbon content in 1st cut SPL has historically meant that there have been more processing options for 1st SPL cut than 2nd cut SPL. The largest portion of the above ground stockpile is mixed 1st and 2nd cut SPL (about 120,000 tonnes).

[4] SPL stockpile tonnages provided by each smelter. Note: the project scope included no audit or confirmation of the stockpile information provided beyond viewing of stockpiles during site visits.

Slightly more than half of Australia's SPL stockpile (about 390,000 tonnes) is stored in landfills onsite at several sites around Australia. The composition of the landfilled SPL is not known, but is likely to be around 50-60% 1st cut and 40-50% 2nd cut SPL.

## E5 Site aboveground SPL stockpile drawdown plans

The following definition for an 'SPL drawdown plan' has been adopted for this report and analysis.

A 'SPL drawdown plan' is a plan that has at least 2 of the following:

1. The smelter can demonstrate a recent (i.e. the last 3 years) history of significant stockpile drawdown. It should be noted that, during consultation, several smelters provided data/charts that illustrated that in the last few years SPL stockpile processing rates have increased, resulting in partial drawdown of existing stockpiles.
2. Commercial arrangements are in place between the smelter and SPL WMP/s[5] that will result in the drawdown of SPL stockpiles and the management of any new SPL arisings.
3. The estimated timeframe for the drawdown of the SPL stockpile has been provided for this public summary report.

Of the six smelting sites in Australia, only Tomago Aluminium has a drawdown plan in place that will have all SPL stockpiles removed from the site well within a 10 year period.

Alcoa Portland also has a drawdown plan in place that is likely to result in all stockpiles removed in around 10 years.

Pacific Aluminium sites at Bell Bay and Boyne (BSL) have drawdown plans in place, however the plans may take up to 10 or more years to implement, depending on the SPL processing rates that are achieved in future.

At the time of writing we understand that the Alcoa Point Henry drawdown plan was still under development. The smelter is closed and undergoing site decommissioning to allow for future development.

At the time of writing we understand that the Hydro Kurri Kurri drawdown plan was still under development. The smelter is closed and undergoing site decommissioning to allow for future development. Hydro stated that they are planning for above ground SPL stockpiles to be recycled over the next 3 to 4 years.

## E6 Capacity of SPL waste management providers (WMPs)[5]

The capacity of Australia's currently operating SPL WMPs consists mostly of 'treatment and processing' facilities in Vic and NSW ([redacted]). The capacity of 'treatment and processing' facilities is related to the off-take markets[6] for treated and processed SPL, see Section 6.6.1 and 7.6 for further discussion.

[5] **SPL waste management providers (WMPs)** for this report are defined as: a third party company that provides services to the aluminium smelting industry that result in the smelter's SPL stockpiles being processed, or sent to approved long term storage facilities. As per the project brief, SPL WMP options discussed include national and international SPL processing options and long term storage facilities in Australia (only).

[6] **Off-take market** refers to the market of options/clients for SPL that is treated and processed to a standard that is fit for a defined purpose.

Cement kilns in Qld and Tas provide the remainder of the operational SPL WMP capacity.

The total licensed/process capacity of Australia's operational SPL WMPs is estimated at around **100,000 tonnes per annum.**

The current export options for SPL management include mineral wool (Rockwool) manufacture in Germany and Befesa in Spain. Befesa recycle aluminium dross salt slags and other residues from dross recycling and use SPL to reduce energy input requirements. Australia has exported around 120,000 tonnes of SPL to European SPL WMPs since the early 1990s and has a permit pending for another 6,000t to be exported. Research, presented in Section 6, indicates that there is significant capacity for SPL processing at Befesa and Rockwool. However, their 'spare capacity' to receive Australian SPL is unknown and would be subject to individual contract negotiations between the aluminium smelter and Befesa or Rockwool.

Australia may also soon have long term storage options available in the NT and WA where Tellus have proposed facilities, however, these facilities are yet to be licensed.

## E7 Considerations for any agreement

Stakeholder consultation and project research identified several important considerations for any SPL stockpile drawdown agreement to consider. They are listed below and discussed in full in Section 7 (a few of these considerations are also discussed in this summary).

1. Aluminium smelting market conditions.
2. SPL WMPs charges (fees).
3. The site specific conditions including:
    a. The site's SPL stockpile profile
    b. Impacts on local environment and intended site afteruse
    c. Proximity of SPL WMPs.
4. Australian (State and Commonwealth) SPL legislative framework.
5. International SPL legislative frameworks and incentive programs.
6. State, national, and international SPL WMP's capacity.
7. The stability of 'off-take' markets for treated and processed SPL.
8. Local community engagement.
9. Parties to agreements.
10. SPL WMP competition and market considerations.

## E8 SPL waste management costs

The financial costs of SPL waste management are significant.

Industry has commented that historically SPL WMPs fees have been in the order of $1000/tonne. These costs have reduced significantly in recent years but still remain a significant consideration and concern for the smelting industry.

The liabilities/costs discussed above present costs to send SPL to a WMP. They are not inclusive of costs to manage other (non-SPL) landfilled materials or costs for other site remediation that could be required. These costs could be a significant addition to the total costs.

There are also costs associated[7] with maintaining SPL in landfills onsite (not removing the stockpile using a SPL WMP).

## E9 Australian above ground SPL stockpile (plus new arisings) versus SPL WMP capacity[8]

The project analysis indicates that the Australian above ground SPL stockpile could theoretically be drawn down in four or more years[9] (whilst continuing to process new arisings). **It is important to note that this theoretical drawdown timeframe is indicative only as there are several important considerations, as listed under E7, which may impact on the actual drawdown timeframe.**

Whilst noting these considerations, the comparison of above ground stockpile tonnages with Australia's currently operating SPL WMPs capacity indicates that it is possible for Australia's above ground SPL stockpile to be drawn down over a ten year period (whilst continuing to process new arisings).

The analysis also indicates that there is sufficient capacity available in Vic and NSW to drawdown SPL stockpiles within the nominal 10 year period that DoEE has identified. The analysis for Qld and Tas indicates that these states have limited SPL processing capacity beyond the tonnage of new annual arisings and would require more than 10 years to drawdown the SPL stockpiles using local capacity alone. For Qld and Tas the analysis indicates that any agreement may need to consider interstate or

[7] The estimation of the costs associated with the landfilling of SPL is beyond the scope of this project.
[8] Australia's currently licensed and operating SPL WMPs **process** SPL. Research, presented in Section 6, indicates that there is significant capacity for SPL processing at Befesa and Rockwool (in Europe). However, their 'spare capacity' to receive Australian SPL is unknown and would be subject to individual contract negotiations between the aluminium smelter and Befesa or Rockwool. Australia currently has no licensed capacity for SPL long term storage. Therefore, the capacity of SPL processing capacity in Australia (rather than overall WMP capacity) is used in the analysis of SPL stockpile drawdown rates.
[9] Timeframes are presented as 'x or more' years reflecting the range of considerations and uncertainties that are outlined in Section 7.

international management options or the establishment of additional local SPL WMP capacity. Refer to Section 7.3.1 for discussion of the requirements for interstate movements of SPL.

### E10 Australian total SPL stockpile and annual arisings versus SPL WMP capacity

**It is important to note that the decision to require processing of any landfilled SPL would be made by the relevant state government regulator.**

The processing of any landfilled SPL would also be subject to demonstration that the SPL removed from landfill is able to be processed. Contamination from non-SPL wastes such as asbestos could prevent processing of some landfilled SPL.

For drawdown calculation purposes, the analysis indicates that, should it be required and technically feasible, Australia's total SPL stockpile and new arisings could theoretically be processed in eight or more years (assuming that 100% of landfilled SPL was processed) or in six or more years (assuming that 50% of landfilled SPL was processed).

### E11 Agreement options and agreement co-funding

Whilst this project has identified a significant number of considerations and issues with SPL management, the project identified just three 'agreement options' that are discussed briefly below. The options presented in this section are not endorsed by the Australian or State Governments nor do they represent government policy.

1. Agreement that 'no agreement' is needed

This may be the preferred approach where there the smelter has an internally agreed SPL management plan in place and a clear timeline for the stockpile to be drawn down that has been effectively implemented over the past several years. The successful historical management of SPL would typically have resulted in a relatively small stockpile of SPL materials remaining onsite.

2. A voluntary agreement

Industry may consider entering into a voluntary agreement to demonstrate to the local community and to state regulators that a plan is in place that will ensure SPL stockpiles are being responsibly managed. A voluntary agreement may also be required to be eligible for any co-funding of SPL management costs.

3. A legally binding agreement

The use of statutory covenants by DoEE or other regulators may be required as part of any co-funding of SPL management costs. They could also be required where there is significant social concern that the SPL stockpile has no plan in place for removal or future management to ensure human health and the environment are protected. It is important to note that State Governments have existing powers under contaminated land and hazardous waste legislation that could also be used to enforce the 'clean-up' of SPL stockpiles.

Within the voluntary and legally binding agreement options, the project identified two models of co-funding including:

1. Agreement to co-fund the smelter for SPL WMP costs (rebate to smelter)
2. Agreement to co-fund the third party SPL WMP costs (e.g. rebate to SPL WMP).

During consultation, industry identified another co-funding model which was for the government to consider the potential to look beyond 'subsidised processing' models and look to an industry-government co-funded processing solution (i.e. build, own, operate) with future processing/transport pricing agreed and fixed for 10 years.

## E12 The feasibility of an agreement based approach to SPL stockpile drawdown

This project aimed to test the feasibility of using an agreement based approach to drawdown Australia's SPL stockpile over a period of around 10 years.

**The analysis indicates that it is feasible to use an agreement based approach to develop site-specific agreements with the aluminium smelting industry, SPL WMPs, and Australian governments that could enable SPL stockpile drawdown in around ten years.**

The agreement type (voluntary or binding), parties, and any potential co-funding would need detailed consideration that is beyond the scope of this project.

## E13 Recommendations

The following is recommended.

1. DoEE progress with discussions with all Australian aluminium smelters and SPL WMPs to develop site specific agreements that will help ensure the drawdown of above ground SPL stockpiles over the next 10 years. Whilst Tomago Aluminium has a short drawdown plan in place, they should still be consulted, at least initially, to ensure they are not disadvantaged for proactively processing their SPL stockpile.
2. DoEE maintain communication with the relevant state EPAs to monitor the outcomes of current assessments/audits of onsite SPL landfills.
3. Should landfilled SPL be required to be removed from site and/or processed, DoEE should look to include the additional tonnages into any agreement this is being considered.
4. The development of any agreement includes full assessment of the considerations that are listed under E7 and discussed in Section 7 of this report. Included in this assessment should be a confirmation of the stockpile tonnage figures for each site that were provided for this report.
5. Where any agreement potentially includes co-funding that DoEE ensure that the considerations included in Section 10 are fully assessed.
6. If co-funding is being considered as part of an agreement, DoEE should undertake additional analysis of the historical and current 'baseline' pricing for SPL WMPs. The indicative pricing information gathered during this project is insufficient to support decisions regarding the amount of co-funding that should be provided per tonne (for example).

# 1 Introduction

In March 2016, the Department of the Environment and Energy (DoEE) engaged Randell Environmental Consulting (REC) in association with Ascend Waste and Environment to complete the *Spent Pot Lining (SPL) project (feasibility of an agreement based approach to clear stockpiles).*

## 1.1 Project scope

DoEE provided a letter of introduction for project stakeholders that outlined the project scope as follows:

*"The project will assess the feasibility of using an agreement between industry and governments to clear the stockpiles of spent pot liner (SPL) present in Queensland, New South Wales, Victoria and Tasmania, over a ten year or similar period. The project aims to determine the feasibility of such an agreement approach, and if feasible, what might be required to address the circumstances of the different SPL stockpiles across the jurisdictions.*

*The project will take into account domestic capacity to recover and recycle spent pot liner, whether through smelters or alternate processes such as rockwool production. The role of export for recycling in such a stockpile clearance agreement will also be identified.*

*The project will report on the following:*

- *Industry consultation including initial stakeholder responses*
- *Estimates of the SPL profile stockpile volumes, composition in Australia*
- *A summary of SPL fate options (including export) and considerations for each*
- *High-level estimates of relative cost for identified fate options*
- *Analysis of the key issues that would need to be addressed in any Government-industry agreement on SPL removal*
- *'Agreement options' for stakeholders to consider that respond to the key issues identified (above)*
- *The likely implementation timeframes required for the agreement options and the feasibility of these timeframes for projects such as the Kurri Kurri development site remediation".*

This project is **not** aiming to draft any industry-government agreements. It aims to understand if it is possible for agreements to be developed that would result in a drawdown of SPL stockpiles over around 10 years.

This report is intended for publication on the DoEE website. Information that industry identified as confidential or commercial-in-confidence information is either not included in this report or has been redacted (see red blocks of text).

## 1.2 Project background and context

In 2015 DoEE commissioned a study of hazardous waste arisings and infrastructure capacity in Australia called *Hazardous waste infrastructure needs and capacity assessment*[10].

The study identified that a significant SPL stockpile had accumulated in Australia and included the following:

> *"The storage of large quantities of spent potlining from aluminium smelting should be a social concern, especially given the recent decline of this industry. The three current operators able to process this waste report sufficient capacity to process the stockpile over a 10-15 year period. A mismatch between demand and capacity could cause inappropriate treatment or demand for exports. A nationally coordinated negotiation with the industry is recommended.*
>
> *Recommendation 6: DoEE should consult with the aluminium industry and NSW, Vic, Qld, Tas State Governments to develop a nationally agreed approach to the management of spent potlining stockpiles that ensures their eventual removal and ongoing recovery or treatment."* Page xxi.

This project responds in part to these recommendations.

Environmental legislation administered by the Australian Government and State Government environmental regulators does not support the long term stockpiling of hazardous wastes onsite where it poses ongoing potential risks. The short term storage of SPL in suitable shedding onsite may be appropriate; however, onsite stockpiling in sheds is not a long term solution for SPL management, where the SPL remains exposed to risks such as extreme weather events.

The Australian Government, therefore, seeks to understand if it is feasible to use an agreement based approach with the aluminium industry stakeholders that will result in a plan to drawdown the Australian SPL stockpile over the next 10 years.

## 1.3 Report structure

Responding to the project scope this report includes the following:

- **Section 2** provides an outline of the project method.
- **Section 3** provides a summary of what SPL waste is and how it is generated.
- **Section 4** provides the site details of Australian aluminium smelters including annual production of aluminium, site history, historical SPL management and a map of locations.
- **Section 5** provides the profile of the Australian SPL waste stockpiles including the tonnages of 1st cut, 2nd cut and mixtures of SPL stored at each smelting site (both above and below ground). This section also outlines each site's SPL stockpile drawdown plan (years to draw down above ground stockpiles where a plan was provided).

[10] Available at: https://www.environment.gov.au/protection/publications/hazardous-waste-infrastructure-needs-capacity-assessment

- **Section 6** provides a summary of the different SPL management options and SPL WMPs[11].
- **Section 7** provides analysis of the key issues and considerations that any potential industry-government agreement needs to consider. This section summarises the issues raised by stakeholders during consultation.
- **Section 8** provides analysis of Australia's current SPL stockpile versus Australia's SPL WMPs capacity.
- **Section 9** provides analysis of the agreement options that could be considered based on this project's analysis.
- **Section 10** provides analysis of potential government co-funding incentive models that could be considered based on this project's analysis.
- **Section 11 and 12** provides project conclusions and recommendations.

## 2 Project method

The table below summarises the project delivery steps and provides a brief description of each.

**Table 1: Summary of project method**

| Project step | Brief description |
|---|---|
| 1. Project planning | Developed project plan including a project consultation plan. |
| 2. Logistics planning (face to face meetings) | Contacted industry (including generators, processors, long term storage) and government regulators and arranged an onsite face-to-face consultation to discuss the feasibility of SPL stockpile drawdown. |
| 3. Desktop review of SPL management | Completed a desktop review of SPL governance and current stockpiles by jurisdiction. Compiled a summary of the current state of SPL. |
| 4. Consultation #1: extensive onsite stakeholder engagement | Held consultation meetings with SPL generators (aluminium smelters), processors, long term storage and government regulators in Vic, NSW, Qld, and Tas. |
| 5. *Confidential site consultation draft reports* preparation | Developed site consultation reports for all smelters, SPL processors, and long term storage facilities in Australia. These reports are confidential as they contain confidential and commercial- in-confidence information about each site. The report included assessments of feasibility of SPL stockpile drawdown and types of agreements that could be |

[11] **SPL waste management providers (WMPs)** for this report are defined as: a third party company that provides services to the aluminium smelting industry that result in the smelter's SPL stockpiles being processed, or sent to approved long term storage facilities. As per the project brief, SPL WMP options discussed include national and international SPL processing options and long term storage facilities in Australia (only).

| Project step | Brief description |
|---|---|
| | put in place for each site. |
| 6. Consultation #2: consultation on *Confidential site consultation draft reports* | Issued confidential site consultation reports to each site and relevant state regulator for formal comment. Completed follow-up consultation with stakeholders (by phone) as required discussing the content of the draft report. |
| 7. *Confidential site consultation final reports* preparation | Finalised each site consultation report, including providing a response to comments appendix for each site report. |
| 8. *Spent Pot Lining project (feasibility of an agreement based approach to clearing stockpiles) draft report* preparation | Developed the draft report providing a summary of the project analysis and recommendations. |
| 9. Consultation #3: *Spent Pot Lining project (feasibility of an agreement based approach to clearing stockpiles)* | Issue draft report to stakeholders for comment. |
| 10. *Spent Pot Lining project (feasibility of an agreement based approach to clearing stockpiles)* final report completion | Amend draft national summary report and issue final report to DoEE. |

In completing Consultation step #1 (noted in the table above), Paul Randell and/or Geoff Latimer met with site staff. The project's aim, delivery schedule and information requirements were stepped through, including a specific conversation on handling information that may be commercially confidential.

In particular, the following project data requirements for the site were discussed:

- detailed data regarding SPL stockpiles tonnages and composition onsite (above and below ground)
- current and future management plans for SPL stockpiles onsite, including any SPL stockpile drawdown plans that are in place and anticipated timelines for total stockpile drawdown
- a brief discussion of advantages and disadvantages experienced with the SPL management options and WMPs recently utilised or investigated.

The above information requests were followed up formally via email, in parallel with the circulation of minutes of the meeting, for approval.

In discussing the possible configurations of industry agreements, views on key issues and concerns, from the site's perspective, that any agreement would need to consider, were also sought. It was noted that the form and nature of such agreements was still evolving at the time of the site meeting and it is beyond the scope of this project to develop any actual draft agreements.

# 3 What is SPL waste and how is it generated?

The following section provides a concise summary of SPL waste and how it is generated.

SPL is a waste material generated from aluminium smelters, of which there are four in current operation in Australia and two recently closed down.

Aluminium smelting is the extraction of aluminium metal from aluminium oxide (also known as alumina). The process takes place in electrolytic cells that are known as 'pots'[12]. The photo below shows one of Australia's largest 'potlines' at Boyne Smelters Limited in Qld. As illustrated below each smelter has a large number of pots to maintain – the higher the number of pots the higher the smelter's aluminium production.

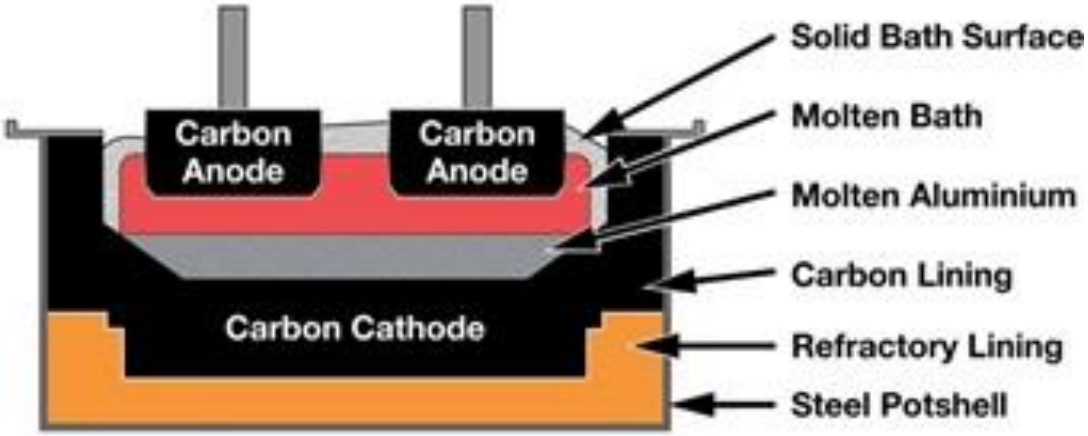
**Figure 1 Aluminium smelter 'pot line' at Boyne Smelters Limited Qld**

*Source: http://sales.riotintoaluminium.com/freedom.aspx?pid=356*

A cross section of a pot is provided in Figure 2 which illustrates that pots are made up of a steel potshell with two linings, an outer insulating or refractory lining and an inner carbon lining that acts as the cathode. The pots also include a carbon based anode which is consumed during the pot operation, but can be replaced before the pot (cathode) reaches the end of its life.

[12] Sometimes referred to as cells, hence **SPL is often referred to as SCL – they are the same thing.**

**Figure 2 Cross section of an aluminium smelting pot**



*Source: http://www.regainmaterials.com/aluminium-smelting-industry/aluminium-production-process*

JOM 2013 explains "the lining, during operation of the cells, is subject to strong reducing conditions and fails after 5-8 years by a variety of mechanisms depending on how the cell was constructed, designed and operated" (page 1441).

When the pot lining fails – SPL waste is generated.

The pot linings are removed by being broken up. The contaminated carbon lining material that is removed is referred to as **first cut SPL.** The contaminated refractory lining material is referred to as **second cut SPL.**

As the SPL is removed it breaks up into different sized pieces ranging from large blocks to fine granular pieces. Some smelters keep the first and second cut SPL separate, other do not and the SPL is removed as one 'cut'. The photos below illustrate the SPL removal process.

**Figure 3 SPL removal and a pile of SPL (both first and second cut)**

*Source: http://www.hydro.com/en/Press-room/News/Archive/2013/From-waste-to-resource/*

JOM 2013 also discusses the amount of SPL that is generated per tonne of aluminium smelted and states "a typical figure of 22 kg/tonne of aluminium produced" (page 1441).

During the operation of the pots, substances, including fluorides, cyanides, and aluminium are absorbed into **both** cell linings.

Both first and second cut SPL are hazardous waste due to:

- toxicity – leachable fluoride and cyanide compounds, with fluoride levels often around 10 parts per hundred (%)
- corrosiveness – high pH due to the presence of alkali metals and oxides
- reactivity with water – producing toxic, explosive, and inflammable gases.[13]

The toxic, corrosive, and reactive nature of SPL means that particular care must be taken in its handling, transportation, and storage.

Transport Canada 1991 documented an incident in 1990 in Quebec Canada where inappropriately stored and transported SPL caused a large explosion on a ship that killed two crew members and injured several more. It should be noted that since the explosion in 1990 and following appropriate United Nations endorsed risk mitigation measures, many thousands of tonnes of spent pot lining has been shipped around the world without incident.

SPL has been recognised as a major environmental concern for the industry for decades. SPL also has recovery potential because of its fluoride and energy (carbon) content.

First cut SPL is similar or slightly higher in fluoride content than second cut SPL but, because it mostly consists of carbon, it absorbs more heavy metals and other substances of concern such as cyanide, which have the potential to leach into the environment. While first cut SPL can be more of a waste management concern than second cut SPL (the USEPA focus more on first cut SPL), both cuts are typically classed as hazardous waste. The hazard classification of SPL in Australia is discussed in detail in Section 7.3.

[13] Source: JOM2013

# 4 Australian aluminium smelters

## 4.1 Site details and aluminium production rates

Australia has four operational and two recently closed aluminium smelters. These are summarised in the table below.

**Table 2: Australian aluminium smelters operational and closed**

| State | Majority owner | Common site name | Production began | Status | Smelter location | Al production (t/year) |
|---|---|---|---|---|---|---|
| **NSW** | Hydro | Hydro Kurri Kurri | 1969 | Closed | Kurri Kurri | NA (180,000) |
| | Tomago Aluminium | Tomago | 1983 | Operational | Tomago | 590,000 |
| **Qld** | Pacific Aluminium | BSL (Boyne Smelters Limited) | 1982 | Operational | Boyne Island | >570,000 |
| **Vic** | Alcoa | Portland | 1986 | Operational | Portland | 304,000 |
| | Alcoa | Point Henry | 1963 | Closed | Point Henry | NA (192,000) |
| **Tas** | Pacific Aluminium | Bell Bay | 1955 | Operational | Bell Bay | 180,000 |
| | | | | | **Total:** | **~1,650,000** |

*Note: production tonnages for closed sites (in brackets) refers to production in year before closure.*

Australia is *currently producing* about 1.65 Mt of aluminium per annum. Based on the JOM 2013 typical figure of 22kg SPL per tonne of aluminium production, it can be estimated that Australia is currently generating about **36,000 tonnes of SPL per annum.**

## 4.2 Site histories and historical SPL management

This section discusses the history of each of the smelting sites and their historical management of SPL. This section discusses several companies and processes used for historical SPL waste management. **Refer to Section 6 for the detailed discussion of the SPL management options and SPL WMPs.**

### 4.2.1 Hydro Kurri Kurri

The Kurri Kurri aluminium smelter began operation in 1969 and was acquired by Hydro, a member of Hydro Aluminium Group based in Norway, in 2002. Production ceased in September 2012. Prior to closure, Kurri Kurri's smelter production capacity was approximately 180,000 tonnes per annum.

The decision to cease production at the Kurri Kurri aluminium plant in 2012 was based on the overall market situation for aluminium, such as the continued weak macro-economic environment, with low metal prices, uncertain market outlook and strong Australian dollar (AUD) relative to the U.S. dollar (USD).

After keeping the smelter in 'care and maintenance' mode for almost two years, Hydro began plans for significant development around the site, which includes an industrial estate, residential housing and a conservation reserve.

Hydro is now making plans to demolish the smelter and remediate the site. They have submitted Planning Proposals to both the Cessnock and Maitland City Councils that cover proposed redevelopment rezoning requirements. Hydro also submitted a Demolition Development Application to Cessnock Council in 2015 for demolition of part of the smelter infrastructure. Planning approval was received in March 2016.

After a period of discussions with NSW EPA and the Department of Planning and Environment, Hydro has lodged an Environmental Impact Statement (EIS) for its Demolition and Remediation Project. The EIS for the remediation has recently been through the public exhibition process.

Hydro have gone through a process of identifying various options for dealing with SPL-containing wastes in their capped waste stockpile (CWS) and have assessed each potential option against a range of criteria including: timeframe, legacy, risk, corporate social responsibility, environmental outcome, economic viability and permissibility.[14]

The EIS proposes the construction of an engineered containment cell onsite, into which CWS material will be relocated.

The onsite CWS received SPL and other wastes from the 1960s to 1993. Hydro stated that other deposited wastes have been confirmed (via sampling) including friable asbestos from historically disposed casting floats, gaskets and other consumables. Hydro estimate that less than half of the in the CWS is SPL. The CWS is not an engineered landfill, and as such is likely to be leaching contaminants such as fluoride and cyanide, although Hydro have stated that the leachate contamination plume is contained to local groundwater.

From 1993 onwards SPL has been stored in above-ground shed structures.

From the mid-2000s Regain has processed some of Hydro's SPL.

Hydro has not exported SPL overseas for processing from the Kurri Kurri site.

### 4.2.2 Tomago Aluminium Tomago

Tomago Aluminium began production in 1983. At that time, it was the world's first large-scale Pechiney 'AP18' plant, with two potlines and an annual production capacity of about 240,000 tonnes. Further expansions in the 1990s, followed by a technology change in 2001 and subsequent production increases in the last seven years have taken production capacity up to 590,000 tonnes per annum.

Tomago have never landfilled SPL onsite.

Tomago arranged twelve export shipments in total, from the late 1980s/early 1990s through to the late 1990s, to manage SPL waste up to that point. From the early 2000s Tomago has utilised local solutions with Regain and more recently with Weston Aluminium.

[14] Hydro Kurri Kurri, Project Fact Sheet: Demolition and Remediation (2015): http://www.hydro.com/pagefiles/2146575202/ReGrowth%20Fact%20Sheet_Remediation.pdf

Their earliest export shipments were to an Italian company called Selca. Selca sent mineral outputs into cement kilns and carbon outputs into steel manufacturing. Approximately 95,000t of SPL was exported to Selca.

Their next shipments were to Befesa, in Spain. Three shipments were sent to Befesa, 2 x 8,000t and 7,000t, bringing the total exported to date to approximately 118,000t.

Tomago's approach to export has become more efficient and effective as they have learnt from each process, and this degree of planning has led to economically and logistically good export outcomes for Tomago's SPL.

Since the early 2000s Regain has been present onsite at Tomago, processing their SPL. Pots are 'delined' via a lightly watered process by Tomago and stored in a single shed. Loads are taken from this shed by Regain and processed by drying, crushing, and thermal treatment via a rotary kiln (to remove cyanides and make process outputs safer to transport). Regain have kept good pace with arisings since the 2000s and when combined with the export shipments noted above, have led to the relatively small current stockpile.

Tomago also sends SPL to Weston Aluminium, who also have a history of processing Tomago's aluminium dross (which is generated at around 1% of production volumes at Tomago and has recoverable aluminium content). This SPL stream is predominantly the refractory 2nd cut.

### 4.2.3 Pacific Aluminium Boyne Smelters limited (BSL)

BSL have never landfilled SPL onsite.

BSL produces in excess of 570,000 tonnes of aluminium per year. It has been in operation since 1982 and has been extensively expanded over several upgrade iterations.

BSL has a cement manufacturing industry nearby, which is why the COMTOR process was created. The COMTOR plant was commissioned in the mid to late '90s, to process that site's SPL arisings. The solid product was destined for use at in cement manufacture or other local use, such as road base. A liquid caustic soda product was sent for use at the alumina refining process at nearby Queensland Alumina Limited (QAL).

This involved a three stage process of crushing, thermal destruction of cyanide (in a calcination process) and a third wet digestion stage that consisted of adding lime and water. The outputs from the full COMTOR process were a sodium-reduced calcium fluoride rich product (called kiln grade spar) and a concentrated sodium hydroxide product (called Bayer grade caustic) that was suitable for direct reuse at the BSL refinery. During development and early operation of the COMTOR process, it was found to be advantageous to process "whole of pot" SPL rather than separate 1st and 2nd cut. Since this time BSL has not separated the two 'cuts' after cell de-lining.

Despite the kiln grade spar also having significant carbon calorific value, it had only limited fuel value in use as a cement feed material due to it being a damp filter cake containing lots of hydrates. The cement kiln changed from a wet process to a significantly larger capacity 'dry' process. This ultimately proved an advantage to BSL, because from the early 2000s, there was no longer a need to remove sodium as a separate stream. It was able to drop the wet digestion stage of COMTOR.

This partial COMTOR process consists of separation of coarse metal fragments, crushing to <1 mm and thermal drying to prevent the generation of flammable gases during transport and storage. The final crushed and dried product output is pneumatically transferred into specially designed isotainer

trucks, which are pneumatically sealed and contained for the one hour transport to Fisherman's Landing, north of Gladstone. The third stage of COMTOR is currently 'mothballed' onsite.

The DoEE *Hazardous waste permit applications formally received as at 4 April 2016* [15] provides details of an export permit application from BSL to send SPL to Spain presumably to Befesa. The relevant extract is included below. At the time of writing the permit was still being assessed by the department.

| "Notification Number | Applicant | Date Gazetted* | Movement Type | Origin/ Destination** | Waste | Notification Number | Date Gazetted* |
|---|---|---|---|---|---|---|---|
| AUS15-019 | Boyne Smelters | 2/07/2015 | Export | Spain | Spent pot liner (A4050) | **6 000 t** | Recycling/reclamation of metals and metal compounds (R4) |

* Subject to the Administrative Appeals Tribunal Act 1975, a person or persons whose interests are affected by this decision may, within 28 days of publication in the Commonwealth of Australia Gazette, make an application in writing to the Department of the Environment requesting the reasons for the decision.
An application for independent review of the decision may be made to the Administrative Appeals Tribunal on payment of the relevant fee by the applicant within 28 days of receipt of the reasons for the decision, or within 28 days of the Gazettal notice if the reasons for the decision are not sought. Applications should be made to the Deputy Registrar, Administrative Appeals Tribunal in your capital city, as listed under the Commonwealth Government Section in the White Pages.
Further enquiries should be directed to the Director, Hazardous Waste Section, Department of the Environment, GPO Box 787 CANBERRA ACT 2601, or forwarded by e-mail to hwa@environment.gov.au
**Origin and destination not specified for transit permits
***Treatment facility specified for imports only"

### 4.2.4 Alcoa Portland

Alcoa's website provides the following concise summary of the site history for the Portland site.

> *"Production began at Portland Aluminium in 1986 and today the smelter produces approximately 358,000 tonnes of aluminium a year. Alcoa is one of Victoria's largest exporters with all of the aluminium produced at Portland Aluminium exported to the Asian market. Total exports equate to approximately $649 million per annum."*
>
> *"**Potrooms***
>
> *The Portland Aluminium smelter consists of four 750 metre potrooms each housing 102 smelting pots. The potrooms are the heart of the smelting process as it is here that the molten aluminium is produced.*
>
> *In the potrooms, the alumina is fed into a large graphite lined steel furnace known as a pot. The alumina is dissolved in molten cryolite, also known as aluminium fluoride or 'bath'.*
>
> *A high electric current is passed through the pot at low voltage via the anodes which enables the alumina solution to split into its components of aluminium and oxygen. The oxygen reacts directly with the carbon anode, which gets consumed to form carbon dioxide that bubbles* away *and the aluminium collects at the bottom of the pot. The electricity also maintains the temperature of the pot at 960 degrees Celsius.*
>
> *The aluminium is siphoned from the bottom of the pot using a crucible and is then transferred to the ingot mill for casting.*

[15] DoEE *Hazardous waste permit applications formally received as at 4 April 2016* available at https://www.environment.gov.au/protection/hazardous-waste/applying-permit

*Each pot at Portland Aluminium produces two tonnes aluminium a day. Over time, the graphite pot lining will wear and need to be replaced. The steel shells of the pots are also refurbished and relined in the pot lining facility"*.

Source: ALCOA website April 2016, see http://www.alcoa.com/australia/en/info_page/portland_overview.asp

Note: Portland's production is presently curtailed by approx. 15% (since July 2009) below the figures stated above to around 304,000 tonnes per annum.

During consultation Portland provided the following regarding historical SPL management:

*"Historically within Australia the primary management practice for SPL have been storage or disposal to landfill. Portland Aluminium has not land-filled any SPL since operations began in 1986. Dedicated SPL storage areas (at the smelter site and at an offsite storage facility) are used at Portland Aluminium for the storage of SPL generated at the facility. These areas are maintained to ensure that the SPL is stored in an environmentally safe and recoverable condition for subsequent reuse recycling.*

*The aluminium industry, including Alcoa, has been assessing a range of processes for the potential to process SPL. Until recently, there were very few sustainable options available. During this time, Portland Aluminium utilised the following processes:*

*- The treatment of SPL occurred through a dedicated onsite Spent Pot Lining (SPL) treatment plant between 1995 to 2007. Due to the ongoing difficulties with equipment reliability and overall process stability and no outlet for the end product, this process was idled...*

*- Portland Aluminium began transporting to the Point Henry Regain facility for processing in 2007…*

*- In recent years (2011, 2013 and 2014) Portland Aluminium exported 2nd Cut SPL overseas (United Kingdom) for recycling and reclamation of the mineral content. This was a complicated process and with a significant shift in the economics relating to the exporting process and increase in demand for SPL at the Regain facility, exporting to the UK is no longer deemed necessary."*

The 'SPL treatment plant' mentioned above is the '**Ausmelt**' process developed by Alcoa.

During the site visit Portland staff explained that the historical SPL shipments were to JMBI in the UK. These shipping of SPL were problematic due mainly to:

1. Lengthy export approval processes.
2. Complex requirements for shipping hazardous wastes.
3. Difficulties in gaining approval for the SPL to pass through each port.

Portland commented that they are unlikely to seek further export permits due to previous experience, having local opportunities for processing, and the impact of the low Australian dollar on export processing costs.

### 4.2.5 Alcoa Point Henry

Alcoa's website provides the following concise summary of the site history for the Point Henry site.

> ***"History of Point Henry***
> *Point Henry was home to two Alcoa operations – the Point Henry Smelter (1963 to 2014) and the Alcoa Australia Rolled Products rolling mill (1965 to 2014).*
> *The smelter was placed under strategic review in February 2012 due to challenging market conditions. A comprehensive review found the 51-year-old smelter had no prospect of becoming financially viable. The rolling mills served the domestic and Asian can sheet markets which were impacted by excess capacity.*
> *After five decades of operation, in February 2014 Alcoa announced the closure of its Point Henry operations.*
> ***Former operations***
> *In 1961 Alcoa of Australia was formed. Its first project was the construction and commissioning of the Point Henry smelter in Geelong. The first molten metal was poured on April 17 1963.*
> *The smelter was one of the first plants in Australia to produce primary aluminium for domestic and international markets. In its final years the plant produced more than 192,000 tonnes of aluminium per year.*
> *Approximately 45 per cent of the aluminium produced at the Point Henry smelter was sold to the neighbouring Alcoa Australia Rolled Products, where aluminium was rolled into sheet. The remainder of Point Henry's aluminium was sold into Asia (Japan, Korea and Taiwan).*
> *Since 1965 Alcoa produced aluminium sheet at Point Henry, the majority being domestic beverage can end-sheet. Eighty per cent of its rolling capacity was dedicated to supplying the Asian market.*
> *The Alcoa Point Henry industrial operations was separated into three production areas -*
> - *the 'electrode' area where carbon blocks were formed for use as an anode in the smelting process,*
> - *the 'potrooms' where carbon cathodes were used to line the pots where the smelting process was undertaken; and*
> - *the casthouse and rolling area where molten metal was cast into ingots and rolled into sheet.*
>
> *During its 51 years of operation, the Point Henry smelter produced more than 7.3 million tonnes of aluminium – enough to make more than 490 billion cans or 93,000 jumbo jets."*

Source: Alcoa website April 2016, see http://www.alcoa.com/australia/en/info_page/point_henry_history.asp

In April 2015 EPA Victoria issued a 'Clean-up Notice' for the Point Henry site[16]. The Clean-up Notice requires quarterly reporting to provide updates regarding notice implementation. The Alcoa (2016)

[16] Available at: See: http://www.epa.vic.gov.au/about-us/news-centre/news-and-updates/news/2015/april/01/epa-issues-alcoa-with-clean-up-notice-for-point-henry-site

update[17] includes the following regarding current and planned activities regarding the Point Henry site remediation.

> *"**Activities since closure:***
>
> *Alcoa has continued to engage suitably qualified consultants to develop Preliminary Conceptual Site Models and Work Plans for the Industrial Site, the Moolap Landfill, and the Industrial Landfills (SPL and General Refuse Landfill and the CPL Landfill). Work is progressing on appointing consultants for the two remaining zones, the Farmlands and the Wetlands and Grasslands. The aim of these activities is to close out identified data gaps in the Preliminary Site Investigations.*
>
> *In January, Alcoa engaged a specialised groundwater consultant to conduct a Light Non-Aqueous Phase Liquid (LNAPL) extraction trial under the Rolling Mill at Point Henry. The trial was completed with the results now being reviewed by Alcoa. The EPA-Appointed Auditor, Darryl Strudwick has been briefed on progress of the environmental assessment work, and the LNAPL extraction trial throughout the quarter. An onsite meeting with engaged consultants and the Auditor to review the current status was conducted on February 25th 2016.*
>
> *Onsite decommissioning works have continued with submission to the Authority of the Environmental Aspects and Impacts registers associated with the major work packs.*
>
> ***Planned activities for 1 March 2016 – 31 May 2016:***
>
> *Alcoa expects to appoint consultants for the remaining two zones for the development of the Preliminary CSMs and Work Plans. Alcoa will review the Preliminary CSM and Work Plans for the Industrial Landfills, Moolap Landfill and the Industrial Site prior to executing any additional sampling activities that may be required. Alcoa also expects to engage a specialised drilling contractor in anticipation of further sampling that may be required.*
>
> *Alcoa will complete a detailed review of the LNAPL extraction trial results and will continue to maintain regular contact with the EPA-Appointed Auditor".*

During the site visit Alcoa stated that from the site opening in the mid-1960s up to the early 1980s SPL and salt dross waste (from rolling of aluminium ingots) was disposed to the 'industrial landfill'. Alcoa also stated that the 'Moolap landfill' received SPL and salt dross from the mid-1980s to 2003. Both the Industrial and Moolap landfills are currently undergoing an environmental assessment including by an EPA appointed auditor. The findings of this audit are expected around the end of 2016 (calendar). The findings of this audit will help determine the ongoing management requirements for the landfilled SPL at the Point Henry site.

From 2003 up until site closure in 2014, the Regain Services facility (located onsite) processed SPL arisings.[18] The Regain facility remains onsite and operational, however, is not currently processing SPL from the Point Henry site.

Alcoa's 2011 *Environmental Improvement Plan* provides some historical data for the amount of SPL material managed by Regain.

---

[17] The latest update from Alcoa for March 2016 is available here: http://www.alcoa.com/australia/en/pdf/ang_201602_quarterly_report_to_EPA.pdf

[18] Apart from a period of shed storage in the first couple of years while Regain was establishing the operation.

*"Alcoa continues to engage Regain Services Pty Ltd to process SPL and other carbon based by-products into alternative fuel for cement industry at its facility.*

*In 2009, 2,124 tonnes of SPL was produced at Point Henry and Regain Services processed 4,551 tonnes of Point Henry SPL.*

*2010 has seen Point Henry produce 3,184 tonnes of SPL and Regain Services have processed 4,400 tonnes of Point Henry SPL.*

*2011 YTD has seen Point Henry produce 2,018 tonnes of SPL and Regain Services have processed 1,898 tonnes of Point Henry SPL"* (page 18).

Alcoa commented that the closed potlines onsite are as they were when production ceased in July 2014.

### 4.2.6 Pacific Aluminium Bell Bay

The Bell Bay aluminium smelter was the first aluminium smelter in the southern hemisphere beginning production in 1955. The site establishment was as a joint venture between the Australian and Tasmanian governments driven by the difficulties in importing aluminium to Tasmania during wartime. The Bell Bay site was chosen because of its deep water port facilities and Tasmania's hydroelectric generating capacity. Since opening production has grown from 1,200 tonnes to around 180,000 tonnes per annum.[19]

Since the site began operations up until around 1996, SPL was landfilled onsite in un-engineered landfills.

In 1996 approximately 136,000 cubic meters of SPL from landfill storages onsite was removed from old landfill storages into three engineered landfills (referred to by Bell Bay as 'encapsulations') which were approved by the Tasmanian EPA.

The Bell Bay engineered landfills were designed with a 50 year life. After that time the landfilled waste will be reassessed and potentially placed into a replacement landfill. The current landfill is capped and has active leachate treatment and gas venting.

Since the late 1990s SPL has been stockpiled in above ground sheds.

In 2010, Bell Bay began processing SPL at the Cement Australia Railton site (CAR).

To prepare SPL for processing at CAR, Bell Bay Aluminium operates an SPL crushing system onsite. It is based on quarry crushing technology (that is mobile). The Bell Bay SPL pre-processing system consists of the following steps:

1. Removal of any steel (cathode rods) from the SPL wastes.
2. Crushing of SPL in crushing plant. Aluminium and steel residual is removed from the SPL during the crushing process.
3. Loading crushed SPL into purpose built container trailers for transport to Railton cement kiln. Transported under class 4.3 dangerous goods code (see photo below).
4. Feeding of the crushed SPL into cement kiln.

[19] Source: Bell Bay Aluminium website 2016, see http://bellbayaluminium.com.au/history

**Figure 4 Photo of containers used to transport SPL to CAR[20]**

Rio Tinto Aluminium's *Bell Bay Sustainable Development reports* (2010-2015) have publically reported the following tonnages of SPL from Bell Bay as processed at CAR.

**Table 3 Reported Bell Bay SPL processing at CAR**

| Year | 2010[20] | 2011[21] | 2012[22] | 2013[23] | 2014[24] | 2015[25] |
|---|---|---|---|---|---|---|
| SPL reported as processed at CAR (tonnes) | 2,786 | 6,567 | 4,190 | 4,050 | 4,057 | 3,082 |

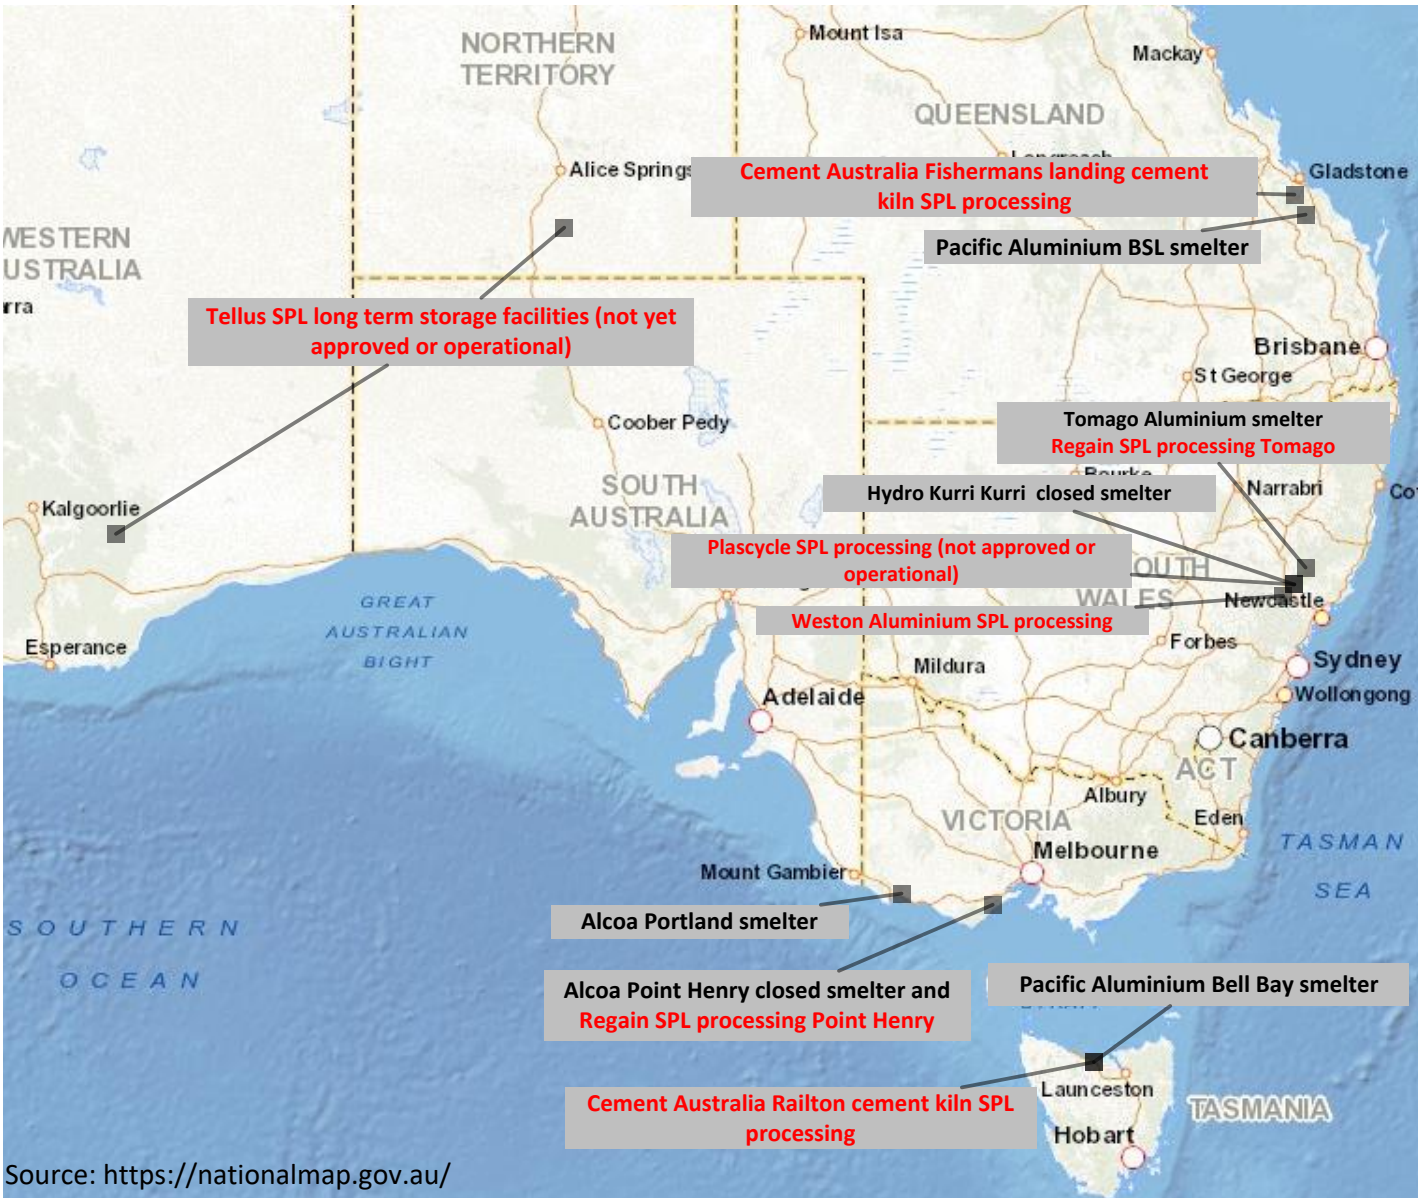
## 4.3 Locations of Australian aluminium smelters and SPL WMPs

Figure 5 illustrates the locations of Australia's currently operating and closed aluminium smelters. It also includes the locations of the Australian SPL WMPs that are discussed in Section 6.

**Figure 5 Map of Australian aluminium smelters and SPL WMPs facilities**



Source: https://nationalmap.gov.au/

# 5 Australian SPL waste stockpile profile

The table below provides the profile of the SPL stockpile in Australia. The table details the stockpiles on each site, including if the stockpile is segregated 1st or 2nd cut, or a combination of both (referred to as mixed SPL). The table also details tonnages of SPL that are currently stored above ground (in sheds) or in a landfill onsite.

**Table 4 SPL waste stockpile tonnage profile**

| Site | State | SPL above ground (tonnes)[26] | | | | SPL landfilled (tonnes) | Total SPL stockpile onsite (tonnes) | Est. new SPL arisings (tonnes/ year) | Site SPL drawdown plan (above ground) (years) | Data source/comments/assumptions |
|---|---|---|---|---|---|---|---|---|---|---|
| | | 1st cut SPL | 2nd cut SPL | Mixed SPL | Sub total | | | | | |
| Alcoa Portland | Vic | 59,192 | 23,720 | | 82,912 | 0 | 82,912 | 3,600 | 10 | Data provided by Alcoa in written submission. The drawdown plan (years) is assumed based on information provided regarding previous processing rate. |
| Alcoa Point Henry | Vic | 9,600 | 6,400 | | 16,000 | 164,424 | 180,424 | - | Under development | Data provided by Alcoa in written submission. |
| Tomago Aluminium | NSW | 5,027 | 4,256 | | 9,283 | 0 | 9,283 | 10,000 | 2 | Data from confirmed site meeting minutes. |
| Hydro Kurri Kurri | NSW | 40,000 | 40,000 | | 80,000 | 90,000 | 170,000 | - | Under development[27] | Data from confirmed site meeting minutes. |
| Boyne Smelters Limited | Qld | | | 90,000 | 90,000 | 0 | 90,000 | 12,500 | 16 or more | Data provided by Pacific Aluminium in written submission. |
| Bell Bay Aluminium | Tas | | | 30,000 | 30,000 | 136,000[28] | 166,000 | 3,000 | 10 or more | Data provided by Pacific Aluminium in written submission. |
| **Totals** | | **113,819** | **74,376** | **120,000** | **308,195** | **390,424** | **698,619** | **29,100** | | |

[26] The SPL above ground tonnages includes the tonnages of SPL that remain in potlines at the closed smelters at Alcoa Point Henry and Hydro Kurri Kurri.
[27] Hydro stated that they are planning for above ground SPL stockpiles to be recycled over the next 3 to 4 years.
[28] Pacific Aluminium reported 136,000 $m^3$. We have assumed a 1:1 conversion factor for $m^3$ to tonnes.

## 5.1 Analysis of SPL stockpile data

The data presented in Table 4 confirms that Australia has a significant stockpile of SPL with a total of around 700,000 tonnes of SPL in either above ground or below ground storages around Australia.[29]

Just under half of Australia's SPL stockpile (about 310,000 tonnes) is stored in above ground stockpiles. Interestingly there is a higher proportion of 1st cut SPL (about 114,000) than 2nd cut SPL (about 74,000). The high carbon content in 1st cut SPL has historically meant that there have been more processing options for 1st SPL cut than 2nd cut SPL. The largest portion of the above ground stockpile is mixed 1st and 2nd cut SPL (about 120,000 tonnes).

Just over the other half of Australia's SPL stockpile (about 390,000 tonnes) is stored in landfills onsite at several sites around Australia. The composition of the landfilled SPL is not known, but is likely to be around 50-60% 1st cut and 40-50% 2nd cut SPL.

## 5.2 Site aboveground SPL stockpile drawdown plans

The following definition for an 'SPL drawdown plan' has been adopted for this report and analysis.

An 'SPL drawdown plan' is a plan that has at least 2 of the following:

1. The smelter can demonstrate a recent (i.e. the last 3 years) history of significant stockpile drawdown. It should be noted that, during consultation, several smelters provided data/charts that illustrate that in the last few years SPL stockpile processing rates have increased resulting in partial drawdown of existing stockpiles.
2. Commercial arrangements are in place with between the smelter and SPL WMP/s that will result in the drawdown of SPL stockpiles and the management of any new SPL arisings.
3. The estimated timeframe for the drawdown of the SPL stockpile has been provided for this public summary report.

Of the six smelting sites in Australia, only Tomago Aluminium has a drawdown plan in place that will have all SPL stockpiles removed from the site well within a 10 year period.

Alcoa Portland also has a drawdown plan in place that is likely to result in all stockpiles removed in around 10 years.

Pacific Aluminium sites at Bell Bay and Boyne (BSL) have drawdown plans in place, however the plans may take up to 10 or more years to implement, depending on the SPL processing rates that are achieved in future.

At the time of writing we understand that the Alcoa Point Henry drawdown plan was still under development. The smelter is closed and undergoing site decommissioning to allow for future development.

At the time of writing we understand that the Hydro Kurri Kurri drawdown plan was still under development. The smelter is closed and undergoing site decommissioning to allow for future

[29] This 700,000 tonnes stockpile estimate is around 22% less than the 900,000 tonnes stockpile that was identified in the 2015 *Hazardous waste infrastructure needs and capacity assessment* report. The higher figure was provided during industry consultation and it is unclear what year the data referred to and the method used to estimate the totals.

development. Hydro stated that they are planning for above ground SPL stockpiles to be recycled over the next 3 to 4 years.

## 5.3 Uncertainty in stockpile tonnage assessment

The information provided in the Table 4 has all been provided by site operators – who have been very helpful and forthcoming during the consultation and information gathering phase of this project. It is beyond the scope of this project to audit the data provided by sites regarding stockpile volumes/tonnages, beyond a basic site visit and viewing of the stockpiles. The authors have no reason to doubt the stockpiles data provided, however, it needs to be noted that an audit of the dimensions of storage sheds or landfill extent of SPL waste has not been completed.

The national estimated annual SPL generation rate of 29,100 tonnes per annum, tallied from site-supplied figures, is below what is estimated in Section 4.1 (36,000 tonnes per annum). The estimates of SPL generation provided by industry are around 19% lower than what might be expected based on the current annual production capacity. There may be smelting practices and/ or pot lining preservation techniques that can explain this difference, however, this has not been confirmed by industry.

# 6 Summary of SPL management options and WMPs

A brief summary of SPL options available in Australia or via export is provided, in alphabetical order, in Table 5. These include those currently operational and planned to be operational within the nominal 10 year period of national stockpile draw down. Each of the options is discussed in more detail in the sections that follow the table.

**Table 5 Summary of SPL management options and WMPs available to Australian aluminium smelters**

| Option | SPL Waste management providers (WMPs) | Process description | Off-take market(s) | SPL 1st or 2nd cut or both | Licensed capacity (t/yr) |
|---|---|---|---|---|---|
| Cement manufacturing ('direct feed') | Cement Australia: Railton kiln (Tas).<br>Cement Australia: Fisherman's Landing kiln (Qld) | Direct use of smelter prepared 1st and 2nd cut, and whole of pot SPL in Portland cement clinker manufacture. | Construction, building, major projects | Both | Limited by process capacity not licence |
| Co-processing SPL with salt slags **(export)** | Befesa (Spain).<br>JBMI (UK, process used is unknown) | Befesa operate plants to recycle Al dross salt slags and other residues from dross recycling. SPL is used to reduce energy input requirements. | 1. Mineral outputs to cement or mineral wool. 2. Salt for dross treatment | Both | Unknown |
| Long term storage | Tellus Holdings two sites: Chandler (NT) and Sandy Ridge (WA). | Long term storage or permanent isolation in deep geological (salt) repository. **Not yet approved or operational. Estimated operational late 2017.** | N/A | Both | Not yet licensed.<br>Potential: NT 400k<br>WA 100k. |
| Mineral wool manufacturing **(export)** | Rockwool (Germany) | Blocks of 1st cut SPL are used in the process of manufacturing mineral wool, as a partial substitute for coke. Process not suited to 2nd cut or 1st cut fines SPL. | Insulation products for building sector | 1st | Unknown |
| Plasma arc vitrification | Plascycle, Hunter region, NSW | Plans for pilot plant scale plasma arc destruction technology. **Not yet operational - concept stage only.** | If slag is inert may have reuse options | Both | Not yet licensed. |
| Thermal treatment and processing | Regain (onsite at Tomago, NSW and Point Henry, Vic) | Crushing, grinding, low temperature destruction of cyanide (CN) and off-gases followed by blending to specification as mineral feedstock for cement kilns. | Cement industry (mostly export) | Both | Tomago:20k<br>Point Henry: limited by process not licence. |
| Thermal treatment and processing | Weston Aluminium, Weston NSW | Thermal destruction of CN and off-gases to create a feedstock specification for client manufacturing processes. Currently doing 'mixed SPL trial' till August 2016. | Brick manufacturing (mostly export) | 2nd (currently) | Total for Al dross and SPL: 40K<br>Trial: 3K mixed SPL |

### Additional potential SPL management options and WMPs[30]

It is important to note that other potential options/WMPs exist, beyond those included in Table 5, for SPL management **within Australia**. At the time of writing these additional SPL management options/WMPs were not developed and/or did not have approvals in place for SPL and are therefore not as likely to have capacity to receive SPL within the next 10 years.

These include the use of SPL or SPL-derived materials as feedstock in domestic industries such as:

- Cement manufacturing kilns in South Australia and NSW (beyond the Cement Australia kilns discussed).
- Steel manufacturing in NSW. Note steel manufacturing is only suited for processing 1st cut SPL.
- Brick manufacturing in NSW.
- Waste to energy plants that could have capability to process SPL.

**Internationally**, additional options/WMPs not included in Table 5 include:

- Additional cement or brick manufacturing sites in numerous countries that could potentially take untreated SPL for 'direct feed'. Australia currently exports *treated and processed* SPL to international cement and brick kilns via Regain Materials and Weston Aluminium. This study did not identify plans or DoEE export permits for export of untreated SPL to international cement or brick kilns.
- Rio Tinto's low caustic leaching and liming process (LCL&L) plant built in Quebec Canada in 2008. Although this is at commercial scale (80,000tpa SPL capacity), it is still in an R&D phase and not likely to be able to service Australian smelters.
- SELCA Eco-industry in Italy, historically have processed SPL however no information was identified and this site is understood to have now closed.

## 6.1 Cement manufacturing ('direct feed')

A focus of most SPL recovery options is to incorporate the SPL into other processes where the high fluoride in the SPL (and the other constituents) can be tolerated or may even give beneficial effects. This is the case in cement manufacture.

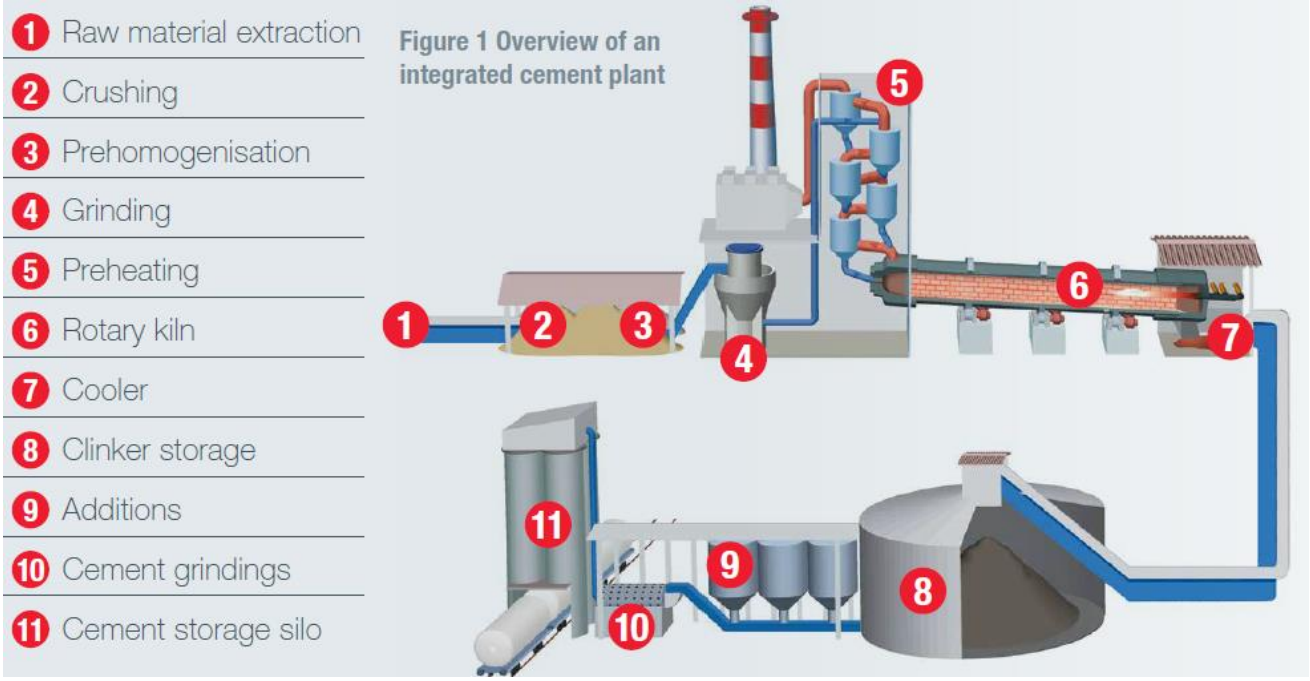
Figure 6, below, provides an overview of the eleven steps in the cement manufacturing process. At the most basic level cement manufacture can be described in the following four phases:

1. Limestone (calcium carbonate), clay, and shale (alumino silicates and iron oxides) ('**rawmix**'), extraction, crushing, grinding, homogenisation (steps 1-4).
2. Rawmix preheating and/or pre-calcination (step 5).

[30] **SPL waste management providers (WMPs)** for this report are defined as: a third party company that provides services to the aluminium smelting industry that result in the smelter's SPL stockpiles being processed, or sent to approved long term storage facilities. As per the project brief, SPL WMP options discussed include national and international SPL processing options and long term storage facilities in Australia (only).

3. Rawmix heating in a rotary kiln at temperatures of up to 1450 degrees Celsius to produce 'clinker' (step 6).
4. Clinker cooling, storage, additions of gypsum, and grinding to make Portland cement (steps 7-11).

**Figure 6 Overview of cement manufacturing process**



*Source: Cement Industry Federation 2013*

'Direct feed' of smelter prepared[31] SPL into the kiln is typically feed into the preheater/pre-calcination tower at the inlet of the rotary kiln.

The main advantages of SPL use in cement manufacture include:

- The carbon in 1st cut SPL provides calorific value, the fluorides acts as a mineraliser[32], and the sodium acts as a fluxing agent lowering the temperature for clinker formation and saving fuel and reducing greenhouse gas emissions. [33]
- Both 1st and 2nd cut SPL can be processed in cement kilns.
- The fluoride in SPL slows the rate of hardening of cement, which increases its overall strength.
- The fluoride in SPL is locked up as $CaF_2$, which transforms SPL-fluoride from highly leachable to almost inert.

[31] Smelters prepare SPL for feeding into the cement kilns to varying degrees. As a minimum 1st and 2nd cut SPL is screened and ground to a size suitable for feeding into the preheater/pre-calcination tower.
[32] A "mineraliser is a substance that accelerates reaction rates and promotes the formation of desired materials in the liquid phase of cement clinker or similar materials". Source: Regain Technologies 2014.
[33] Source: Regain Technologies 2014

- At a global level, the cement industry has very large and secure off-take markets – it is the main ingredient in concrete. Behind water, concrete is the second most consumed material on earth[34].

The main disadvantages of SPL use in cement manufacture include:

- SPL's high and variable sodium content. Too much alkaline sodium is detrimental to cement product performance, leading to lessening strength properties and potentially cracking. Too much alkali content also impacts on the preheater/pre-calcination tower performance – leading to deposits/blockages.[35] The rotary kiln refractory lining can also be damaged by high alkali content SPL. Consequently, alkali content is tightly controlled through a regulatory maximum alkali content of 0.6% w/w sodium oxide equivalent in Australian cement product. The alkali constraint is often less of an issue elsewhere in the world due to lower alkalis in rawmix feedstocks, which allows for higher sodium levels (and therefore more tolerance of input feedstock such as SPL) in overseas markets.
- SPL high and variable fluoride content. As noted above, fluoride addition slows rate of hardening of concrete increasing strength development. However, slowing the hardening rate is also a disadvantage because it increases the time required before concreting formwork can be removed and the next stage of construction work commenced. The cement industry uses other additives to improve the early strength development to enable quick formwork removal in construction.
- The 'smelter prepared SPL' requires careful and potentially costly management for transport and storage onsite at the cement kiln due to the hazardous characteristics of untreated SPL. For example, the SPL needs to be kept dry to avoid the generation of explosive gases and all storage areas need failsafe ventilation.

Best practice SPL management in the cement industry is to utilize as much SPL as can be accommodated (for fluoride and energy value) while limiting alkali below the 0.6% w/w maximum. This limits SPL addition[36] to kiln feedstock to allow for variability in the alkali levels in both SPL and the kiln rawmix. The limiting of SPL addition to feedstock to allow for variability in alkali levels can lessen the fluoride mineralising effects note above.

In Australia there are two cement kilns that currently are licensed to accept SPL (both operated by Cement Australia):

- Fishermans Landing (near Gladstone) accepts SPL from Boyne Smelters Limited (BSL)[37]
- Railton in Tasmania, accepts SPL from Rio Tinto's Bell Bay smelter[38].

The available capacity of these two kilns to receive SPL is not limited by EPA licensing, it is limited by the 'alkali gap' (how much additional alkaline content can be tolerated beyond that in the rawmix).[39]

---

[34] Cement Industry Federation Australia 2015.
[35] Some kilns operate a '**alkali bypass'** which allow for the bleeding off of high alkali content gas/dust from the kiln which allows for higher alkali content rawmix and potentially additional capacity for SPL addition.
[36] Industry consultation suggested SPL addition is limited to around 0.3% of feedstock tonnages in Australia.
[37] http://gilg.com.au/gladstone/news_feed/cement-australia-and-kevin-doyle
[38] Rio Tinto Alcan Bell Bay, *2010 Sustainable Development report*. Available at: http://www.riotinto.com/documents/RTA_BellBay2010SDreport.pdf

During consultation, the smelting industry identified that there may be potential for the cement industry to selectively mine rawmix material (limestone, clays) for a period of 10 years that are lower in alkali content, which would allow for additional SPL processing capacity (by providing a higher alkali gap).

Important to the economics of both of the Cement Australia kilns receiving SPL is the geographic closeness of kiln to the aluminium smelter. These are good examples of how synergies of located industrial infrastructure enable SPL solutions at one site that may not be feasible at another site.

Where a cement kiln is not locally located, the smelter would likely face additional costs due to:

- long transport distances
- potentially complex approvals and transport requirements for international shipping of the SPL as a hazardous waste and Dangerous Good Div 4.3. The same could apply to a lesser extent for interstate movements.

## 6.2 Co-processing SPL with aluminium dross salt slags (export)

In Europe dross from the aluminium industry is treated with salt to recover aluminium. Aluminium dross is a residual waste that is created during aluminium smelting and casting processing.

Befesa (Spain) operate plants to recycle dross salt slags and other residues from dross recycling to recover mineral materials and salts for other industrial uses. Befesa have found that adding one part ground and screened SPL to three parts salts/residues decreases the energy input required to operate their water leach process.[40]

Befesa operate five plants in Europe with an installed capacity to recycle salt slags and SPL. The combined capacity is +630,000 t of salt slags and SPLs annually (+413,200 t/y of salt slags and **+23,800 t/y of SPLs recycled**).[41]

Australian smelters have sent SPL to Befesa via export permits in the past. The capacity of Befesa to receive new shipments of Australian SPL is unknown and would be subject to a contract negotiation between the Australian smelter and Befesa.

## 6.3 Long term storage

Tellus Holdings have two geological repository sites: Chandler (NT) and Sandy Ridge (WA).

Chandler underground salt mine and storage and isolation facility is a deep geological repository remotely located in Central Australia 120km south of Alice Springs. Storage of materials, equipment and waste would be in salt strata according to similar practices used in Europe or North America for similar wastes, known as salt repository. Salt repositories have very high integrity for waste disposal, due to the inert nature of the salt and its geological plasticity (salt will creep slowly over time).

---

[39] A possible issue for future SPL processing capacity of cement kilns in Australia (and globally) could be a reduction in SPL processing capacity due to the cement industry processing other wastes that limit SPL processing rates (beyond the alkali gap limitations discussed above).

[40] Holywell G, Breault R, Almagi Inc and Rio Tinto Alcan - Research and Development Centre (2013). *An Overview of Useful Methods to Treat, Recover, or Recycle Spent Potlining*, JOM, Volume 65, Issue 11, pp.1444.

[41] Source (May 2016)
http://www.befesa.com/export/sites/befesa2014/resources/pdf/quienes_somos/2013_BES_Presentation_en.pdf

Sandy Ridge is classified as an arid near-surface geological repository. It is located approximately 150 km west/ north west of Kalgoorlie, and adjacent to the existing Mt Walton 'intractable waste disposal' facility, Western Australia's only Class V landfill (their highest risk ranking of five categories of landfill).

Both facilities plan to be licensed to receive hazardous waste material such as SPL which will be stored on a 'like with like' basis to facilitate full retrievability of the material for future recycling and beneficial use.

The two facilities are currently progressing through feasibility, planning and regulatory approval processes. The Sandy Ridge site is planned to be accepting first wastes by late 2017, with the Chandler facility to follow approximately 12-24 months later.

Although regulatory approvals are not yet in place, the Chandler site has a proposed capacity of 400,000 tpa while the Sandy Ridge facility proposes a licensed capacity of 100,000 tpa.

## 6.4 Mineral wool manufacturing (export)

In 2013 Norsk Hydro in Norway entered into a contractual agreement with Rockwool™ International in Germany, to process their 1st cut SPL.[42] Because it is high in carbon it has been used as a substitute for coke in the thermal process of insulation material production. It is not clear whether this agreement, which was to expire at the end of 2013, has been extended or what the outcomes of using SPL in that industry were.

Literature[43] suggest that a French aluminium smelter may also have exported SPL to Germany for mineral wool manufacture.

Section 7.4.2, below discusses the European Union funding a project under the LIFE program that supported the development of the mineral wool process to process SPL. The European Commission website provides another reference[44] which discusses the potential capacity of the mineral industry to receive SPL:

> "From technical point of view is seems to be possible to substitute 20 - 25% what will give 64 - 80 kt/a coke saving and **105 - 130 kt/a recycled lump SPL.** That is 1.5 - 2 times the amount of the total European SPL waste. Time consuming permission procedures, needed investments and an unclear market situation is the reason why a fast progress is unrealistic".

This suggests that there is significant capacity available for SPL processing in mineral wool manufacture, however, the publication date is not provided and the current status of mineral wool capacity to receive SPL needs confirmation. Industry noted during consultation that mineral wool manufacture would only be suited to blocks of 1st cut SPL processing. The process is not suited to 2nd cut SPL **or** to fines of 1st cut SPL. It is assumed that the mineral wool processing of SPL is not equipped to manage 1st cut SPL fines due to dust and furnace feed-in issues.

---

[42] Source May 2016: http://www.aluminiumtoday.com/news/view/norway-hydros-rockwool-contract-benefits-the-environment

[43] Holywell G, Breault R, Almagi Inc and Rio Tinto Alcan - Research and Development Centre (2013). *An Overview of Useful Methods to Treat, Recover, or Recycle Spent Potlining*, JOM, Volume 65, Issue 11, pp.1441-1451.

[44] European Commission *LIFE05 ENV/DK/000158 WASTE AND SEWAGE RECYCLING IN STONE WOOL PRODUCTION After-LIFE Communication Plan (Section 10 in the final technical report)*

Rockwool 2015, page 27, provided the following recent data regarding the tonnages of recycled product used in mineral wool manufacturing.

**"Recycling and reclaimed products**

| Year | | 2012 | 2013 | 2014 |
|---|---|---|---|---|
| Recycling of residue from other industries | metric tons | **564,900** | **619,400** | **543,815** |
| % recycled content (secondary melt raw materials per metric ton stone wool) | % | 25.9 | 27.9 | 23.7" |

The proportion of the 543kt of 'residues from other industries' that is SPL is not provided in the above references. However, the above two references do indicate that there is a significant capacity in the mineral wool industry for SPL. It is unknown if there is currently any 'spare capacity' for processing Australian SPL at the Rockwool sites taking SPL.

## 6.5 Plasma arc vitrification

A company called Plascycle has plans to establish a pilot scale plasma arc facility in the Hunter region, with the aim of destroying 'problematic' wastes that could include SPL. These plans would involve subsequent recovery of inert slag material for industrial or construction uses.

Discussions regarding siting are well-progressed however the facility is still in concept phase and potential future capacity remains confidential.

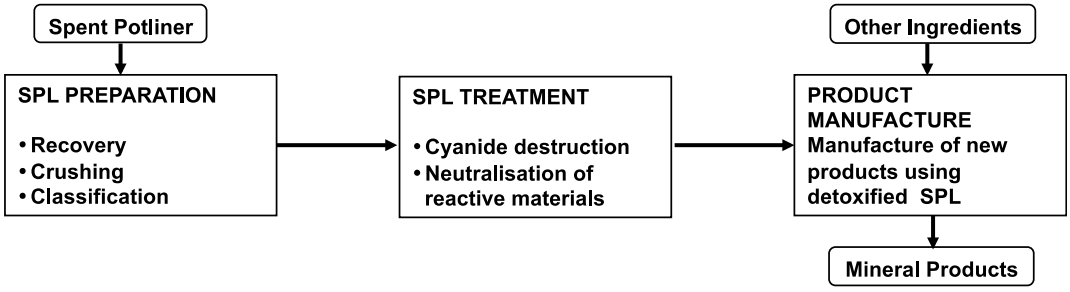
## 6.6 Thermal treatment and processing

### 6.6.1 Regain

Regain Services has plants onsite at Point Henry smelter (Alcoa), and Tomago Aluminium sites.

Regain provided the following description of their SPL process.

"*The process of SPL recovery, detoxification and manufacture of new products that are not classified as hazardous waste is shown in below.*



***SPL Preparation*** *involves (a) recovery of material from storage or directly from pots, (b) primary segregation of aluminium metal, carbon materials and refractory materials, (c) sorting into like material streams and (d) crushing and size classification in preparation for further processing.*

*The cyanide and explosion hazards in the SPL are eliminated through the* ***SPL Treatment*** *process. Cyanide destruction is achieved by thermal oxidation i.e. heating the material in the presence of oxygen. Neutralisation of the reactive compounds and aluminium metal is*

*achieved by using water to bring on the reactions that generate the explosive gases in a controlled environment in special apparatus such that no more gas can be generated.*

*Mineral products with fluxing and mineralising properties are **manufactured** by processing the detoxified SPL material and other ingredients*".

The Regain process does not destroy the fluoride hazard in SPL, which has some benefit for clinkering in downstream cement manufacturing markets.

Regain export processed SPL to cement kilns overseas as HiCal cement clinker mineralising products used to improve cement production.

Regain currently supply only limited HiCal to Australian cement kilns.[45,46,47] The Australian cement product standards set a maximum alkali (0.6% w/w sodium oxide equivalent) content in cement clinker. The raw materials (rawmix) in Australia have elevated alkali content and hence have a small 'alkali gap' that limits the input of HiCal (and untreated SPL) into the kiln. In international markets cement industries either do not have such industry regulation and/or have lower alkali levels in raw materials so have more capacity for (and in some cases a need for) the increased alkali (sodium) that Regain outputs (and untreated SPL) can provide.

Regain 2015 provided analysis of the international cement industry's capacity to receive processed SPL. Regain's analysis states that:

"*The SPL generation per tonne of primary aluminium is about equal to the potential consumption of refined byproducts per tonne of Portland cement clinker (around 20kg each). But as worldwide clinker production (4bnt in 2013) is around 100 times greater than worldwide primary aluminium production (47Mt in 2013) then statistically, only one in a hundred cement plants is required to participate in this industrial ecosystem".*

Regain's website states they have diverted:

*"more than 300,000 tonnes of cyanide and fluoride contaminated waste diverted from the waste stream including more than 200,000 tonnes of SPL. It represents a viable techno-commercial solution to what has been an intractable problem for the primary aluminum smelting industry. Progressive cost reductions have been realised as benefits accruing from the technology learning curve, continuous improvement, economies of scale and revenues from the sale of refined products*"[48]

Regain's Point Henry plant is currently processing SPL and operates under the umbrella of the Alcoa site licence (licence 11481[49]). The licence does not specify an annual processing capacity limit for the plant. It does limit storage of the waste materials to 3,000 tonnes.

Regain's Tomago site is currently processing SPL and operates under licence number 13269[50] and the site has a licensed capacity to process 20,000 tonnes per annum.

---

### 6.6.2 Weston Aluminium

Weston Aluminium is situated in Weston in the Hunter region of NSW. They have operated historically as a salt dross processing company, to recover aluminium, but have also developed a process for 1st and 2nd cut SPL. While details of this process are not known to the authors it does involve, in a similar vein to Regain, thermal destruction of cyanide and off-gases, in this case using a furnace at $1000^0$C. Additional processing and off-take market information has been withheld on request from Weston Aluminium.

Weston is currently only licensed for 2nd cut SPL (under licence number 6423). The licence limits processing capacity to 40,000 tonnes per year combined total of SPL and aluminium dross. The license also limits storage onsite to 5,000 tonnes. Weston is currently completing a mixed SPL trial (from 3.8.2015 – 2.8.2016) for a maximum of 3,000 tonnes for the 12 month trial (1,000t stored at any time).[51]

# 7 Considerations for any agreement

Stakeholder consultation and project analysis have identified several key considerations in forming any agreement, discussed below.

## 7.1 Aluminium smelting market conditions

The aluminium industry is growing globally but has been in decline in Australia resulting in the recent closure of two of six smelters. The Australian aluminium industry has been under significant pressure from falling aluminium prices, since mid-2011, a strong Australian dollar, and increased global competition.

Figure 7 illustrates historical prices of Aluminium (in $US) from 1994 to 2016. Excluding the price drop in 2008 (during the global financial crisis) current prices are similar to those in 2000. The Australian dollar is currently trading at around $US 0.75 whereas it was trading at around $US 0.55 in 2000 – resulting in lower incomes for Australian aluminium exports in 2016 than in 2000.

**Figure 7 Historical price of aluminium 1994 to 2016**

Source: http://www.tradingeconomics.com/commodity/aluminum (August 2016).

### 7.1.1 SPL waste management costs

The financial costs of SPL management are significant. Industry has commented that historical costs of SPL management have been in the order of $1000/tonne. These costs have reduced significantly in recent years but still remain a significant consideration and concern for the smelting industry.

The liabilities/costs discussed above present costs to send SPL to a WMP. They are not inclusive of costs to manage other (non-SPL) landfilled materials or costs for other site remediation that could be required. These costs could be a significant addition to the total costs.

There are also costs[52] associated with maintaining SPL in landfills onsite (not removing the stockpile using a SPL WMP).

## 7.2 Each site is different and management options vary

A significant historical stockpile of SPL has accumulated at most smelting sites in Australia that requires management. There are, however, significant differences between each of the smelter sites that need consideration in drafting any agreement.

### 7.2.1 SPL stockpile profile at each site

Any agreement will need to consider the profile of the SPL stockpiles onsite, including:

- the amount of SPL stockpiled (1st and 2nd cut) above ground and below ground
- the storage and landfill standards that are in place for the SPL stockpiles
- other wastes that may be mixed together with landfilled SPL.

### 7.2.2 Impacts on local environment and intended site afteruse

The level of environmental impact that SPL stockpiles have caused at each site needs to be analysed to understand if the current management of SPL stockpiles is adequate.

Where SPL stockpiles are landfilled onsite and are impacting the local environment, additional stockpile clean-up actions are likely to be required by state government regulators in the short to medium term. Industry may have constrained funding available to meet these costs.

[52] The estimation of the costs associated with the landfilling of SPL is beyond the scope of this project.

Related to the above is the intended afteruse of the site. The more sensitive the intended afteruse of the site – the more stringent the level of site cleanup is likely to be.

### 7.2.3 Proximity of SPL WMPs

As discussed in 6.1 the proximity of different SPL WMPs can also have a significant impact on the management costs and the complexity of transport requirements.

From our work to date it is clear that a 'one size fits all' approach to an industry wide agreement is not a feasible. Any agreement needs to take the site context into consideration.

## 7.3 Australian SPL legislative framework

As discussed in Section 3, electrolytic cells from aluminium smelting, known as pots, are made up of steel shells with two linings, an outer insulating or refractory lining (known as 'second cut' pot liner waste) and an inner carbon lining that acts as the cathode (known as 'first cut' pot liner waste). After some years of operation, the pot lining fails and is removed.

The removed material is SPL, a hazardous waste due to:

- the presence of fluoride and cyanide compounds that are leachable in water
- its corrosiveness – it exhibits high pH due to the presence of alkali metals and oxides
- its reactivity with water - producing inflammable, toxic and explosive gases, such as hydrogen, methane, and ammonia.

The toxic, corrosive, and reactive nature of SPL means that particular care must be taken in its handling, transportation, and storage.

Typical concentrations of contaminants in first and second cut SPL from Australian smelters are shown in Table 6.

**Table 6 Range of chemical analysis of SPL in Australia**

| Component | Unit | 1st cut SPL | 2nd cut SPL |
|---|---|---|---|
| Carbon as C | % | 30 – 50 | 2 – 10 |
| Silicon as $SiO_2$ | % | 2 – 15 | 10 – 40 |
| Iron as $Fe_2O_3$ | % | 2 – 4 | 1 – 6 |
| Aluminium as $Al_2O_3$ | % | 10 – 30 | 15 – 30 |
| Calcium as CaO | % | 1 – 5 | 1 – 5 |
| Magnesium as MgO | % | 0 – 2 | 0.5 – 2.5 |
| Sodium as $Na_2O$ | % | 3 – 25 | 5 – 30 |
| Potassium as $K_2O$ | % | 0.2 – 1 | 0.5 – 1.5 |
| Fluorine as F | % | 5 – 15 | 5 – 15 |
| Cyanide as CN | mg/kg | 100 – 4,000 | 100 – 1,500 |

Source: Regain Technologies 2014.

### 7.3.1 State and Territory level

Hazardous waste in Australia is regulated at the state/territory level, addressing risks arising from generation, workplace health and safety, transport, treatment and disposal. Increasingly, the Commonwealth Government has taken an overarching role in coordination, consistency and prioritising areas of policy intervention at a national level, in concert with states and territories.

Hazardous waste classification is often done for the purposes of disposal, typically to landfill, so classification systems tend to be based around this. States and territories have developed guidelines for a number of organic and inorganic contaminants in wastes, soils or waste derived materials based on these two drivers. As such these guidelines have been developed based on risks such as leaching of contaminants to groundwater, potential for impact of leachate to surface waters and potential for impacts of such leachate on humans and ecological health. These risks are relevant to hazard characterisation and categorisation of SPL.

The process of classification in each state is the primary legislation relevant to determining how the waste should be regulated and managed.

Table 7 assesses each SPL-relevant state's regulatory framework, using the typical values from Table 6, to classify both cuts of SPL in an Australian jurisdictional context. Note that SPL is in the upper end of the range for total cyanides and may also fall into the highest hazard category for fluoride and cyanide, although this is immaterial to the classification outcome.

**Table 7 SPL waste classification in Australia**

| Jurisdiction | Most relevant legislation | Jurisdictional hazard classification of SPL | | | | Regulatory consequence[53] |
|---|---|---|---|---|---|---|
| | | 1st cut SPL | Due to | 2nd cut SPL | Due to | |
| NSW | *Protection of the Environment Operations (Waste) Regulation 2005* | Hazardous waste | • Australian Code for the Transport of Dangerous Goods by Road & Rail (ADGC), Div. 4.3<br>• Fluoride | Hazardous waste | • ADGC Div. 4.3<br>• Fluoride | Both 1st & 2nd cuts cannot go to direct to landfill. Immobilisation approval must be obtained and require chemical treatment of SPL to reduce the hazardous properties of SPL before landfilling. |
| Qld | *Environment Protection Regulation 2008* | Regulated waste | • ADGC Div. 4.3<br>• Fluoride, cyanides | Regulated waste | • ADGC Div. 4.3<br>• Fluoride, cyanides | Regulated waste in QLD. Individual landfill licence conditions determine acceptance of SPL. |
| Tas | *Environmental Management and Pollution Control (Waste Management) Regulations 2010* | Controlled waste | • ADGC Div. 4.3<br>• Fluoride | Controlled waste | • ADGC Div. 4.3<br>• Fluoride | The handling of controlled waste requires approval from the Director, EPA. |
| Vic | *Environment Protection (Industrial Waste Resource) Regulations 2009* | Prescribed industrial waste, Category A | • ADGC Div. 4.3<br>• Fluoride | Prescribed industrial waste, Category A | • ADGC Div. 4.3<br>• Fluoride | Both 1st & 2nd cuts cannot go to direct to landfill. Immobilisation or other treatment to destroy /reduce hazard must occur. |

These classifications have been arrived at using the following jurisdictional information sources:

- NSW, *Waste Classification Guidelines Part 1: Classifying waste*: http://www.epa.nsw.gov.au/resources/wasteregulation/140796-classify-waste.pdf. In NSW the Chemical Control Order (CCO) is currently the only regulatory tool that allows the processing of SPL waste for the recovery of components and producing SPL derived products (see http://www.epa.nsw.gov.au/pesticides/ccos.htm )
- Qld, *Waste tracking guideline. Seeking an exemption for trackable waste*: http://www.ehp.qld.gov.au/waste/pdf/seeking-an-exemption.pdf
- Tas, waste classification guideline: http://epa.tas.gov.au/epa/document?docid=55
- Vic, waste classification guideline: http://www.epa.vic.gov.au/~/media/publications/iwrg631.pdf . SPL waste code is 'D400 smelter waste containing prescribed waste'.

[53] Hazardous waste categorisation and the associated management requirements are generally only triggered where waste leaves the site of generation.

Based on the indicative composition data in Table 7, both 1st and 2nd cut SPL in NSW and Victoria are classified at the highest level of hazardous waste in these jurisdictions and as such cannot be sent directly to landfill. They must undergo treatment to immobilise or otherwise treat the hazard so as to remove it.

Queensland and Tasmania are less prescriptive about the allowable management pathway but both classify 1st and 2nd cut SPL as hazardous waste, and would be unlikely to provide (in 2016) an approval offsite landfill as a management approach.

### Movement of 'controlled wastes' (SPL) across state and territory borders

Table 7 analyses how SPL is classified (as hazardous waste) within the respective regulatory frameworks of Australian states and territories. Where transport of SPL crosses interstate borders en route to the management destination, the movements are subject to the *National Environment Protection Measure (Movement of Controlled Waste Between States and Territories) 2004*. This NEPM is discussed in the context of Commonwealth responsibilities in Section 7.3.2, but its implementation is at the state/territory level. 'Controlled waste' is a term specific to the NEPM which has essentially the same meaning as hazardous waste in a national context, and includes SPL. Jurisdictions such as WA, NT and Tasmania also use the 'controlled waste' term within their intrastate classification and legislative structures as well as in regard to interstate movements.

Prior to such movements, a waste producer must apply to obtain a Consignment Authorisation from the waste receiving jurisdiction's environment agency. Discussions occur between the agency of the jurisdiction of origin and the agency of the jurisdiction of destination. Discussions would consider:

- the appropriateness of the receiving facility's licence to accept the waste
- whether the environmental policy and legislative context supports the application.

There are two specific examples of jurisdictional "environmental policy and legislative context", one in Victoria and one in NSW, that are particularly relevant for SPL interstate movements.

In the case of movements of prescribed industrial waste (PIW) out of Victoria, an additional approval under Clause 26(1)(c) of *Victoria's Environment Protection (Industrial Waste Resource) Regulations 2009* is required, obtainable by application to EPA Victoria. In granting approval, EPA must deem the interstate receiving facility to have 'better environmental performance standards' than a facility licensed in Victoria. This clause is aimed at ensuring appropriate levels of environmental management apply to all waste generated in Victoria.

NSW also has a number of policy levers aimed at ensuring accountability in the management fate of wastes. The one with the most potential relevance to interstate movements of waste is the 'proximity principle'. The proximity principle is a requirement that waste should be managed as close to the source of generation as possible – within 150km of source, or further only if the treatment/disposal facility is one of "the two nearest lawful disposal facilities." However, the majority of hazardous wastes (including SPL) were made exempt from this requirement via NSW EPA notice[54] in 2015.

[54] Notice of Exemption from Clause 71: Application of proximity principle to transportation in the course of business. See http://www.epa.nsw.gov.au/resources/wasteregulation/exempt-proximity-principle.pdf

### 7.3.2 Commonwealth level

#### The Basel Convention

The *Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal*[55] (the "Basel Convention") regulates the movement of hazardous wastes across international boundaries. Australia was a foundation signatory to it in 1992, when it came into force.

The Convention puts an onus on exporting countries to ensure that hazardous wastes are managed in an environmentally sound manner in the country of import. These obligations are placed on countries that are party to the Convention. One hundred and fifty-one countries have ratified the Basel Convention as at December 2002. The obligations are to:

- minimise generation of hazardous waste
- ensure adequate disposal facilities are available
- control and reduce international movements of hazardous waste
- ensure environmentally sound management of wastes
- prevent and punish illegal traffic.

#### Hazardous Waste Act

The Commonwealth Government implements its Basel Convention responsibilities through the *Hazardous Waste (Regulation of Exports and Imports) Act 1989*[56] (the "Hazardous Waste Act"), which regulates (via a permitting system) movement of hazardous wastes in and out of Australia.

The object of the Hazardous Waste Act is to:

> *"… regulate the export, import and transit of hazardous waste to ensure that exported, imported or transited waste is managed in an environmentally sound manner so that human beings and the environment, both within and outside Australia, are protected from the harmful effects of the waste."*

The Hazardous Waste Act and (indirectly) the Basel Convention are relevant considerations in any agreement where export of hazardous wastes is integral to a management option.

Key aspects to be considered are:

- the definition of 'waste' (Section 4, p.9 of Hazardous Waste Act)
- the definition of 'disposal' (Section 4, p.5 of Hazardous Waste Act)
- the definition of 'hazardous waste' (Section 4, p.5 of Hazardous Waste Act)
- the definition of environmentally sound management (ESM) (Section 4E, p.14 Hazardous Waste Act)
- facilities within Australia that may provide management alternatives for the hazardous waste.

[55] http://www.basel.int/Portals/4/Basel%20Convention/docs/text/BaselConventionText-e.pdf
[56] https://www.environment.gov.au/protection/hazardous-waste/about

With regard to the last point, Section 17(5) (p.32) of the Hazardous Waste Act allows for a permit to be refused on the basis of the existence of a facility in Australia, if its management in such a facility is consistent with ESM and can be done "safely and efficiently" which reflects Basel Convention Article 4, Clause 9(a) p. 23:

> *"9. Parties shall take the appropriate measures to ensure that the transboundary movement of hazardous wastes and other wastes only be allowed if:*
>
> *(a) The State of export does not have the technical capacity and the necessary facilities, capacity or suitable disposal sites in order to dispose of the wastes in question in an environmentally sound and efficient manner…"*

The Hazardous Waste Act is also supported by the *Hazardous Waste (Regulation of Exports and Imports) (OECD Decision) Regulations 1996*, which specifically facilitate export of hazardous wastes from Australia to other OECD countries where these wastes are to be recycled or recovered.

### NEPM for Movement of Controlled Waste between States and Territories

The Commonwealth Government administers the *National Environment Protection Measure (Movement of Controlled Waste between* States *and Territories) 2004* (the "Controlled Waste NEPM") but, because this is enshrined in law in states and territories for implementation, it is essentially just framework legislation at the national level.

### Australian Code for the Transport of Dangerous Goods by Road & Rail

SPL is classified as a dangerous good for the purposes of transport under Division 4.3 of the *Australian Code for the Transport of Dangerous Goods by Road & Rail* (ADGC). The relevant extract is included below.

> "*DIVISION 4.3 - SUBSTANCES WHICH IN CONTACT WITH WATER EMIT FLAMMABLE GASES*
>
> *2.4.4.1 Definitions and properties*
>
> *Certain substances in contact with water may emit flammable gases that can form explosive mixtures with air. Such mixtures are easily ignited by all ordinary sources of ignition, for example naked lights, sparking hand tools or unprotected lamps. The resulting blast wave and flames may endanger people and the environment. The test method referred to in 2.4.4.2 is used to determine whether the reaction of a substance with water leads to the development of a dangerous amount of gases which may be flammable. This test method should not be applied to pyrophoric substances*" (page 91).

SPL is also a dangerous good for the purposes of transport under *Class 9 - miscellaneous dangerous substances and articles, including environmentally hazardous substances* of the ADGC due to SPL being an *Environmentally hazardous substance* as defined in the ADGC.

## 7.4 International SPL legislative frameworks and incentive programs

### 7.4.1 United States of America

#### Regulation of SPL

In 1998, under the *Resource Conservation and Recovery Act (RCRA),* US EPA published *Land Disposal Restrictions; Treatment Standards for Spent Potliners From Primary Aluminum Reduction (K088); Final Rule.* The ruling classified SPL as a hazardous waste in the USA (KO88).

The ruling requires that SPL is "prohibited from land disposal unless the wastes have been treated in compliance with the numerical standards contained in this rule. These treatment standards are necessary to minimize threats to human health and the environment from exposure to hazardous constituents which may potentially leach from landfills to groundwater".

The ruling noted the importance of the destruction of cyanide which it states is the most "dangerous constituent of SPL based on its concentration, toxicity, and the extent of contamination caused by past land disposal of untreated spent potliners" (page 5254).

The ruling established treatment standards for: Cyanide, Polyaromatic Hydrocarbons, certain metals, total Arsenic, and Fluoride.

In developing the ruling US EPA also undertook an analysis of the capacity of readily available treatment technology that could meet the required level of treatment (which at the time was dominated by the Alcoa/Reynolds Metal Company treatment process). The EPA ruled that with the Alcoa/Reynolds facility and other emerging technologies there was sufficient treatment capacity and capability to enforce the ruling.

#### An example of SPL site clean-up requirements in the USA

A number of SPL landfill sites in the USA have had clean-up requirements put in place. The requirements for these site clean-ups provide useful context in understanding the international response to the clean-up of sites with contamination resulting from landfilling SPL in un-engineered landfills.

The Washington State Department of Ecology cleanup requirements for SPL contaminated land at the **former Kaiser Aluminum site in Tacoma Washington** are provided in detail in:

Landau Associates 2014, *Final Interim Action Completion Report Spent Pot Lining Area Former Kaiser Aluminum Property, 3400 Taylor Way Tacoma, Washington, prepared for Port of Tacoma, Tacoma, Washington*, available at: https://fortress.wa.gov/ecy/gsp/CleanupSiteDocuments.aspx?csid=2215

The cleanup area related to an area "which was historically used to dismantle reduction cells and temporarily store SPL and potroom duct dust. From 1943 to 1967, the area was not paved and, for most of the earlier part of this period, the area was not at its present grade" (page 1-1).

Landau 2014, and additional supporting reports, provided a detailed site investigation to identify the extent of the SPL waste stored below ground and the extent of contamination resulting from the SPL.

Landau 2014 provided the following summary regarding the SPL disposal process that was required.

> "***2.7 SPL MATERIAL DISPOSAL***
>
> *Excavated SPL material was temporarily stockpiled along the edge of the excavations, and was subsequently transferred into lined trucks and transported under appropriate hazardous waste manifests for disposal at the Waste Management Subtitle C landfill in Arlington, Oregon. Trucking and disposal records are provided in Appendix F and summarized in Table 1. The originally estimated weight of SPL material to be removed for disposal was 12,500 tons; however, a total of 38,837.94 tons of material from the SPL Area was disposed at the Waste Management hazardous waste landfill between August 6, 2013 and November 14, 2013 (see the waste disposal summary in Table 1). In addition, approximately 1,600 pounds of residual sludge from the automated wheel wash facility was drummed and sent to Waste Management for solidification and landfilling. Additional trucking and disposal records are provided in Appendix G*" (page 2-5).

Landau 2014 Appendix B includes regulatory approvals that state that the SPL from this site was permitted for disposal to a hazardous waste landfill offsite without prior treatment (after site specific detailed assessment). Below are two photos from the site clean-up which provide some insight into the physical state of SPL that has been stored below ground (photo 1 source figure A3, photo 2 source figure A6).

6. SPL zone material (dark gray) and underlying uncontaminated soil.

11. Looking southeast across the southern portion of the SPL Area during removal of SPL material.

## Incentives programs for SPL stockpile cleanup

In 1980, the US Congress established the *Comprehensive Environmental Response, Compensation, and Liability Act* (CERCLA). The CELCLA was established in response a number of significant human health and environmental impacts from the dumping of hazardous wastes. CERCLA is informally called ***Superfund***. The Superfund program is administered by US EPA in cooperation with each state government. The fund to designed to enable the clean up hazardous waste sites by either forcing potentially responsible party (PRP) to perform cleanups or reimburse the government for cleanups led by US EPA.

An important part of the Superfund is **special accounts**. EPA establishes special accounts to provide ready access to PRP cleanup funds for sites where future response work remains. The use of funds secured in special accounts preserves the funding held in the Superfund Trust Fund for cleanup of sites without viable PRPs.

Special accounts are funded entirely with money received from PRPs, and not with funds provided by the US Government through the Superfund Trust Fund. US EPA retains money received through settlements with PRPs in special accounts to conduct planned future cleanup work at the site based on the terms of the settlement agreement.

"More than $4 billion have been deposited in special accounts through PRP settlements. Over $2 billion of those settlement dollars have been spent on Superfund site cleanups and the balance is planned to be used for ongoing or future Superfund cleanup work."

The US EPA reports the following status of special accounts for the fiscal year (FY) 2015 is as follows:

- "created approximately 49 special accounts,
- deposited about $1.778 billion into special accounts,
- earned over $16.8 million in interest on its special accounts,
- for a total of $1.795 billion,
- disbursed or obligated more than $259 million for response work,
- reimbursed itself for over $36 million worth of past cleanup related costs at sites,
- closed 29 special accounts, and
- transferred $974,098 of special account receipts to the Superfund Trust Fund".

Source: US EPA website 2016, see https://www.epa.gov/enforcement/superfund-special-accounts#status

This review did not identify references that detailed how the Superfund legislation and funds have been used in the US for the clean-up of SPL stockpiles.

Alcoa's website provides some detail regarding the cleanup of the Reynolds Metal Company site in Troutdale, Oregon:

> "*A partnership between Alcoa and federal, state, and local governments quickly transformed a former aluminum smelter and **Superfund site** in Troutdale, Oregon (USA), into an industrial park that has the long-term potential to add almost five times more jobs than were lost and generate millions in annual local taxes…*
>
> *… In 1994 when the smelter was still owned by Reynolds, the U.S. Environmental Protection Agency (EPA) declared the smelter and surrounding property a Superfund site due to the spent pot lining, carbon, fluoride, and other hazardous substances that had been landfilled on the site before current disposal laws. While the remedial investigation, feasibility study, and some remediation work on these legacy issues had been completed before Alcoa's acquisition of the site, significant work remained.*
>
> *In 2002, Alcoa decided to permanently curtail the smelter and began evaluating options for the site. One viable alternative was to consolidate all of the remediation waste to a central landfill and cap it. The concern was that this would have rendered a significant portion of the site, which had great redevelopment potential due to its location near major*

*waterways, highways, and Portland's airport and port facilities, largely unusable and undevelopable.*

*Alcoa decided on a US$55 million decommissioning and remediation effort to maximize development of the property. After detailed risk assessments conducted in conjunction with government authorities, the company initiated remediation that would protect the health and safety of people and the environment.*

*Actions undertaken included removing contaminated soil, utilities, tanks, vessels, pipes, and building foundations, with the latter being removed down to eight feet below grade so they wouldn't interfere with new foundations. Alcoa also reclaimed a 16-acre lake on the site, replanted original vegetation, cleared invasive species, addressed a groundwater issue, and installed a new pipeline system for stormwater management*."

Source: https://www.alcoa.com/sustainability/en/case_studies/2010_USA_Troutdale.asp

The Troutdale smelter clean-up provides a good example of the use of the US EPA Superfund to work on the clean-up of SPL stockpiles. *The Oregonian* online article *Cleaned-up Reynolds Metals site in Troutdale sprouts promise*[57] indicates that the clean-up costs for the site were US$223 million and that Alcoa spent more than $50 million to meet its Superfund clean-up obligations on the site. The article also indicates that the 26,000 tons of SPL wastes were taken offsite to a landfill.

### 7.4.2 European Union

#### Regulation of SPL

Under the European Commission *Council Directive of 12 December 1991 on hazardous waste (91 / 689 /EEC)* SPL wastes are a hazardous waste in the EU, based on Cyanide and Fluoride content.

The European Commission *Council Directive 1999/31/EC of 26 April 1999 on the landfill of waste* requires that all waste, including hazardous wastes, sent to landfill in the EU be pre-treated. It is unclear if treated SPL is permitted to be disposed to landfill in the EU and the prohibition of landfilling of particular treated hazardous wastes, such as SPL, would be governed differently in each country.

The European Commission *Waste framework directive,* Article 5 and 6, page 312/11 provides useful context for defining when SPL would be considered a hazardous waste and when it would be considered a product.

Article 5 provides the following criteria for a substance resulting from a production process being regarded as a by-product rather than a waste:

- Further use of the substance or object is certain
- The substance can be used directly without any further processing other than normal industrial practice
- The substance is produced as an integral part of a production process

[57] *The Oregonian* website 2016, see http://www.oregonlive.com/gresham/index.ssf/2011/04/cleaned-up_reynolds_metals_sit.html

- Further use is lawful, i.e. the substance fulfills all relevant product, environmental and health protection requirements for the specific use and will not lead to overall adverse environmental or human health impacts.

Article 6 provides the following criteria for waste to reach 'end of waste status':

- The substance or object is commonly used for specific purposes
- A market or demand exists for such a substance or object
- The substance or object fulfills the technical requirements for the specific purposes and meets the existing legislation and standards applicable to products
- The use of the substance or object will not lead to overall adverse environmental or human health impacts.

### Incentives programs for SPL stockpile cleanup

LIFE is the EU's current financial instrument supporting environmental, nature conservation and climate action projects. Beginning in 1992, LIFE has co-financed over 4000 projects. For the 2014-2020 funding period, LIFE will contribute approximately €3.4 billion to the protection of the environment and climate.[58]

A review of SPL waste processes co-funded by LIFE identified the project *RECYCLING/SYMBIOSIS - Waste and Sewage Recycling and Symbiosis in Stone Wool Production LIFE05 ENV/DK/000158*[59].

The 2007 co-funded project successfully piloted the use of first cut SPL as a substitute for coke in the mineral wool industry. Emissions of fluoride were also effectively managed. This project is a good example of the co-funding of SPL management, however, the amount of industry versus government funding is not known.

The USA Superfund site cleanup of the Alcoa site in Troutdale and the process development trials with Rockwool in the EU provide examples of federal government involvement in the SPL cleanup and processing.

## 7.5 State, national, and international SPL WMPs capacity

To understand the feasibility of agreeing to a stockpile drawdown, over a nominal 10 year period, requires an understanding of SPL WMPs capacity (tonnes per annum) in each state, nationally, and globally.

Historically SPL management options/WMP's capacity and reliability have been limited (globally). In Australia, local processing capacity has improved in recent years.

Australia's currently operating SPL WMPs process SPL. Research, presented in Section 6, indicates that there is significant capacity for SPL processing at Befesa and Rockwool (in Europe). However, their 'spare capacity' to receive Australian SPL is unknown and would be subject to individual contract negotiations between the aluminium smelter and Befesa or Rockwool.

[58] Source (May 2016): http://ec.europa.eu/environment/life/index.htm

[59] A summary report of the project is available at: http://ec.europa.eu/environment/life/project/Projects/index.cfm?fuseaction=search.dspPage&n_proj_id=2824&docType=pdf

Australia currently has no licensed capacity for SPL long term storage.

Therefore, the processing capacity of Australia's operational WMP's (rather than overall WMP capacity) is used in the analysis of SPL stockpile drawdown rates.

An assessment of currently operating SPL WMP's licensed/process capacity in each state versus the SPL tonnages stockpiled in each jurisdiction has been completed (see Section 8).

## 7.6 Stable 'off-take' markets for treated and processed SPL

There have been a number of financially unsuccessful attempts to process SPL in the past. One of the main reasons for the failure of historical SPL processes has been unstable off-take markets.[60]

Where off-take markets are weak the SPL processors 'in-take' charges are usually pushed higher and/or there may be a higher risk that treated and processed SPL is stockpiled (by reprocessors) in effect risking the creation of another hazardous waste stockpile.

In the past few years off-take markets have matured and have been more stable resulting in more consistent processing of SPL arisings.

## 7.7 Local community engagement

Untreated and unprocessed SPL is a hazardous waste. Any facility currently stores or that plans to receive SPL will need to have the appropriate environmental and planning approvals in place and these approvals are typically publically advertised and contestable. The local community of any site that currently stores or plans to receive SPL should be actively engaged to ensure that they are well informed regarding the proposal and how any risks to the local community that storing or receiving SPL could create will be effectively mitigated and safely managed.

## 7.8 Parties to agreements

There are a number of parties that could be involved in any agreement. Who needs to be included, how, and the arrangement for any international parties involved in an agreement needs consideration.

The parties that could be considered in forming an agreement for SPL stockpile drawdown include:

- DoEE and potentially other Australian Government Departments
- State Government regulatory agencies
- Aluminium smelting companies
- SPL WMPs companies
- Hazardous waste long term storage facilities.

The inclusion of any of these parties will depend entirely on the type and form of the agreement, which in turn would depend on the site-specifics of the SPL stockpile.

Any agreement would need to clearly establish the **roles and accountabilities** of each of the parties involved in the agreement.

[60] **Off-take market** refers to the market of options/clients for SPL that is treated and processed to a standard that is fit for a defined purpose.

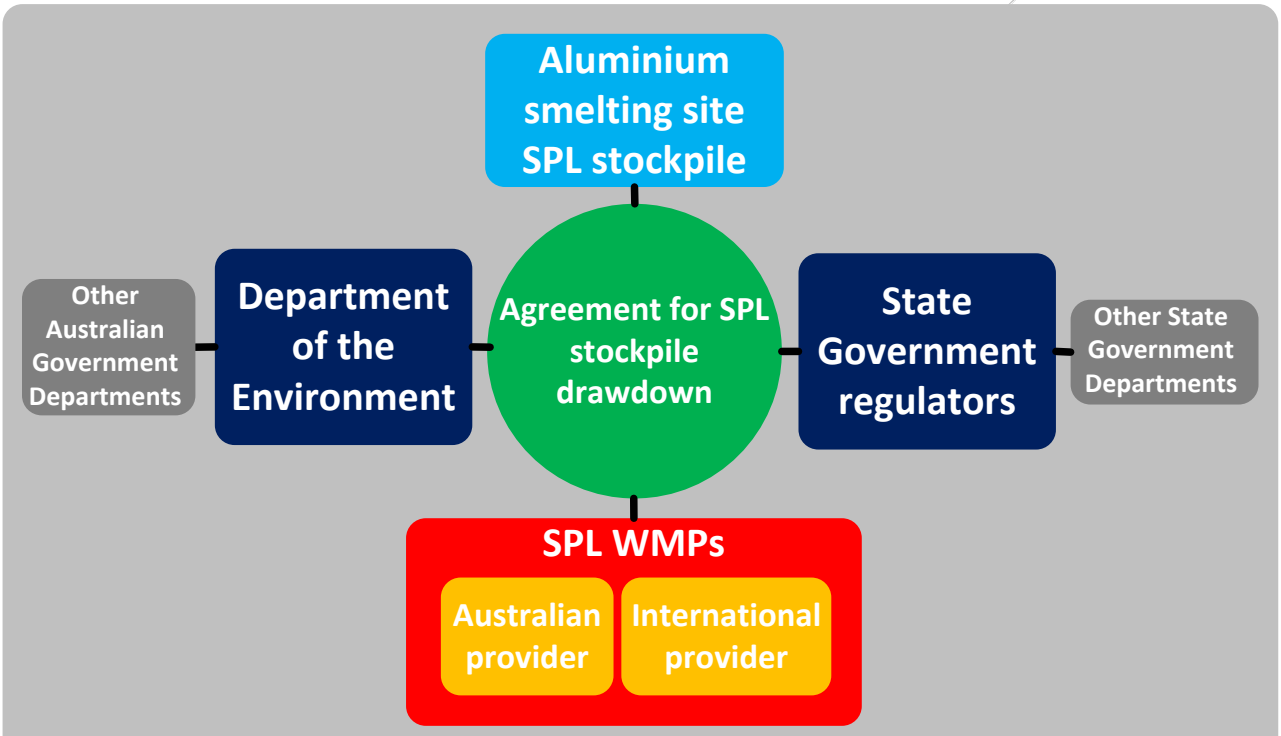
## 7.9 SPL WMPs competition and market considerations

The development of any agreement will need to consider the economic impact of the agreement on the stakeholders included in the agreement and/or other parties that do not form part of an agreement.

Any potential agreement would need to take into consideration the currently limited competition in the SPL WMPs market, so as not to create monopolies or lock out alternatives. For example, in areas where there is only one feasible processing option available, any agreement would need to consider commercial and competition concerns.

Figure 8 below provides a summary of the parties that could be included in an agreement and also provides a summary of the issues that any agreement would need to consider.

**Figure 8 Summary of agreement parties and considerations**



**Issues for consideration in any agreement**

- Site-specific conditions
- Market conditions, value of Aluminium and charges of SPL WMPs
- Compliance with the *Hazardous waste Act* and State environmental legislation
- Tonnes of stockpiled SPL material to be managed
- The timeframe for removing the SPL stockpile from smelting site
- The proposed SPL fate according to the waste hierarchy
- SPL WMP capacity (state, national and international providers)
- The stability of 'off-take' markets for treated and processed SPL
- Local community engagement
- The parties involved in the agreement and their roles and responsibilities
- The information and data audit trail requirements

# 8 Analysis of Australian SPL stockpile and new arisings versus SPL WMP capacity

This section provides analysis of Australia's SPL stockpile (above ground and below ground) plus annual arisings, against annual licensed/process[61] capacity for currently operating SPL processing facilities.

Australia's currently operational SPL WMPs involve SPL processing.

Australia currently has no licensed capacity for SPL long term storage.

Australia has exported around 120,000 tonnes of SPL to European SPL WMPs since the early 1990s and has a permit pending for another 6000t to be exported. Research, presented in Section 6, indicates that there is significant capacity for SPL processing at Befesa and Rockwool. However, their 'spare capacity' to receive Australian SPL is unknown and would be subject to individual contract negotiations between the aluminium smelter and Befesa or Rockwool.

Therefore, the licensed/process capacity of SPL WMPs in Australia (rather than overall SPL WMP capacity) is used in the analysis of SPL stockpile drawdown rates.

## 8.1 Analysis of above ground stockpile plus new annual arisings

The table below provides the summary of the analysis of the Australian above ground SPL stockpile plus annual arisings versus annual licensed/process capacity for currently operating SPL processing facilities in Australia.[62]

**Table 8 Australian above ground SPL stockpile plus annual SPL arisings versus estimated annual licensed/process capacity**

| State | SPL above ground (tonnes) | Est. SPL new arisings (tonnes per year) | Estimated local SPL licensed/process capacity (tonnes per year) | Theoretical years to process above ground SPL locally[63] |
|---|---|---|---|---|
| NSW | 89,283 | 10,000 | | 3 or more |
| Qld | 90,000 | 12,500 | | 10 or more |
| Tas | 30,000 | 3,000 | | 16 or more |
| Vic | 98,912 | 3,600 | | 3 or more |
| **National** | **308,195** | **29,100** | **~100,000** | **4 or more** |

* This capacity is not limited by licensed capacity. Capacity is limited by the installed capacity or process SPL input limitation.

The analysis in Table 8 compares the above ground SPL stockpile and the new arisings from operating smelters with annual licensed/process capacity in each state.

The analysis indicates that the Australian above ground stockpile could theoretically be processed in four or more years (whilst continuing to process new arisings). **It is important to note that this**

[61] The comparison analysis is made against the licensed capacity (where it is specified) of currently operating facilities to provide what aims to be a conservative estimate of processing capacity. As noted in Table 5 the capacity of several SPL processing options is not limited by the site's licence (as no limit is specified). For these processes the SPL option is limited by the installed capacity or the limit of SPL tonnage that the process is limited to.

[62] SPL processing capacity does not include long term storage of SPL at facilities such as the planned Tellus facilities.

[63] Timeframes are presented as 'x or more' years reflecting the range of considerations and uncertainties that are outlined in Section 7.

**theoretical drawdown timeframe is indicative only as there are several important considerations, as discussed in Section 7, which may impact on the actual drawdown timeframe.**

Whilst noting these considerations, the comparison of above ground stockpile tonnages with national processing capacity indicates that it is possible for Australia's above ground SPL stockpile to be drawn down over a 10 year period (whilst continuing to process new arisings).

The analysis in Table 8 also indicates that there is sufficient processing capacity available in Vic and NSW to process SPL stockpiles within the nominal 10 year period that DoEE has identified.

The analysis for Qld and Tas indicates that these states have limited processing capacity beyond the tonnage of new annual arisings and would require more than 10 years to process the SPL stockpiles using local processing capacity alone. For Qld and Tas the analysis indicates that any agreement may need to consider interstate or international processing options or the establishment of additional local SPL WMP capacity.

## 8.2 Analysis of total stockpile drawdown and annual arisings

The analysis in Table 9 compares SPL stockpiles above ground, plus new arisings, and modelled proportions of landfilled SPL for processing against annual licensed/process capacity in each state.

**It is important to note that the decision to require processing of any landfilled SPL would be made by the relevant state government regulator.** The modelling included below is provided simply to help understand the approximate theoretical timeframes that would be required to process differing percentages of the landfilled stockpile (should processing be required). In addition to the considerations flagged in Section 7, the ability to process landfilled SPL stockpiles via the processes included in Section 6 is not clear. This project's literature review did not identify examples of landfilled SPL that has been processed – the examples identified required the removal of SPL to an offsite hazardous waste landfill (see Section 7.4).

**Table 9 Australian SPL stockpile above ground, plus annual arisings, plus modelled landfill tonnage percentage requiring processing**

| | | | | | Percentage of landfilled SPL required to be processed by state regulator | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | 0% | | 50% | | 100% | |
| **State** | **SPL above ground (tonnes)** | **SPL landfilled onsite (tonnes)** | **Est. SPL new arisings (tonnes per year)** | **Local SPL licensed/ process capacity (tonnes per year)** | **Assumed SPL landfilled processed (tonne)** | **Theoretical years to process all SPL stockpiles via local capacity** | **Assumed SPL landfilled processed (tonne)** | **Theoretical years to process all SPL stockpiles via local capacity** | **Assumed SPL landfilled processed (tonne)** | **Theoretical years to process all SPL stockpiles via local capacity** |
| NSW | 89,283 | 90,000 | 10,000 | | 0 | 3 or more | 45,000 | 5 or more | 90,000 | 6 or more |
| Qld | 90,000 | - | 12,500 | | 0 | 10 or more | - | 10 or more | - | 10 or more |
| Tas | 30,000 | Note 3 | 3,000 | | 0 | 16 or more | - | 16 or more | - | 16 or more |
| Vic | 98,912 | 164,424 | 3,600 | | 0 | 3 or more | 82,212 | 5 or more | 164,424 | 8 or more |
| **National** | **308,195** | **254,424** | **29,100** | **~100,000** | **0** | **4 or more** | **127,212** | **6 or more** | **254,424** | **8 or more** |

Notes:

1. The above analysis of SPL drawdown to process all SPL stockpiles includes 1. above ground SPL, 2. the required % of landfilled SPL, and 3. ongoing annual arisings from Al smelting.
2. The ongoing annual arisings of new SPL are assumed to remain constant (at the 2016 annual arisings of 29,100 tonnes/year).
3. The landfilled SPL in Tas has been excluded from the drawdown calculations due to the current landfill licence (with a 50 year life) permitting landfill till at least 2046. This is beyond the likely timeframe of any agreements that may be put in place.
4. Timeframes are presented as 'x or more' years reflecting the range of considerations and uncertainties that are outlined in Section 7.

For drawdown calculation purposes, the analysis indicates that, should it be required and technically feasible, Australia's total SPL stockpile and new arisings could theoretically be processed in eight or more years (assuming that 100% of landfilled SPL was processed) or in six or more years (assuming that 50% of landfilled SPL was processed).

The processing of any landfilled SPL would be subject to direction by state regulators *and* demonstration that the SPL removed from landfill is able to be processed. Contamination from non SPL wastes such as asbestos could prevent processing of some landfilled SPL.

# 9 SPL drawdown agreements

The type and form of the agreements that could be put in place to enable the drawdown of SPL stockpiles in Australia are varied and the DoEE have not proposed a set type or form of agreement to be proposed for this project.

Important context for this project is the *DoEE Hazardous Waste (Regulation of Exports and Imports) Act 1989* (Hazardous waste Act) reforms and cost benefit analysis. The potential reforms are outlined in the report that DoEE released last year titled *Hazardous waste reform proposals analysis* report (see https://www.environment.gov.au/protection/publications/hazardous-waste-reform-proposal-analysis ). The report recommended that the following reform progress to the full cost benefit analysis:

> "**Option i) Power to establish agreements targeting particular wastes**
>
> A power to establish a statutory covenant or similar agreement for dealing with particular wastes (e.g. an agreement with legal status to phase out of stocks of spent pot linings, via domestic and international facilities)" (page 39).

This reform is currently undergoing a full cost benefit analysis. This proposed reform clearly has relevance to the establishing of agreements between the Australian Government and industry on SPL stockpile drawdown. However, it is not intended that all potential agreements that this project recommends would need to be statutory or legally binding; they may be voluntary; or not be needed at all. Each of these options is discussed below.

## 9.1 Agreement options[64]

### 9.1.1 Agreement that 'no agreement' is needed

Following on from this project and the assessment of a site's SPL stockpile and drawdown plan, it may be decided that no additional agreement between governments and the smelter needs to be established.

This may be the preferred approach where there the smelter has an internally agreed SPL management plan in place and a clear timeline for the stockpile to be drawn down that has been effectively implemented over the past several years. The successful historical management of SPL would typically have resulted in a relatively small stockpile of SPL materials remaining onsite.

### 9.1.2 Voluntary agreement

Smelters, governments and SPL WMPs may decide to enter into a non-legally binding agreement for the drawdown of the SPL stockpile on a site. Whilst not legally binding, the agreement would still be supported by:

- An agreed timeline for stockpile drawdown that also considers new SPL arisings.
- Information regarding the SPL WMP/s that will be utilised.
- A financial plan for implementing the agreement, including forecast budget allowances required over the drawdown period.

[64] The options presented in this section are not endorsed by the Australian or State Governments nor do they represent government policy.

- Consideration of contingencies should the future context of the agreement change significantly. For example, changes in commodity values, the failure of a SPL WMP to safely process SPL, or failure in the off-take market for treated and processed SPL.

Industry may consider entering into a voluntary agreement to demonstrate to the local community and to state regulators that a plan is in place that will ensure that SPL stockpiles are being responsibly managed. A voluntary agreement may also be required to be eligible for any co-funding of SPL WMP costs.

### 9.1.3 Legally binding agreement

As discussed above the DoEE are currently completing a cost benefit analysis on the establishment of "power to establish agreements targeting particular wastes" under the Hazardous Waste Act.

A binding agreement would likely include the same content as outlined above for voluntary agreements, however, the agreement would be binding and would have to include actions to be taken if the agreement was broken.

The use of statutory covenants by DoEE may be required as part of any co-funding of SPL WMP costs. They could also be required where there is significant social concern that the SPL stockpile has no plan in place for removal or future management to ensure human health and the environment are protected.

It is important to note that State Governments have existing powers under contaminated land and hazardous waste legislation that could also be used to enforce the 'clean-up' of SPL stockpiles.

# 10 Co-funding model options[65]

Section 7.4.1 discussed the USA Superfund site cleanup of the Alcoa site in Troutdale and the process development trials with Rockwool in the EU. Both are examples of federal government co-funding involvement in the SPL cleanup and SPL WMP development. However, neither example provides an obvious co-funding model relevant to the current Australian context.

Stakeholder consultation completed to date has emphasized the importance of the following for any co-funding of potential agreements in the current Australian context.

- Co-funding should not financially disadvantage smelters that have proactively processed SPL in the past (at a significant cost) by providing competing companies that have accumulated large historical stockpiles (and deferred WMP costs) with more co-funding for SPL WMPs costs.
- Co-funding should not fund any particular third party SPL WMP as it would skew market competition.
- There needs to be a clear audit trail and evidence provided for co-funding and the administration of a potential co-funding agreement needs to be practical.
- Any co-funding of SPL WMPs would need to incentivise the highest practicable environmental outcome according to the waste management hierarchy
- Any co-funding would need to ensure the SPL WMPs co-funded are compliant with the DoEE *Hazardous Waste (Regulation of Exports and Imports) Act 1989.*
- Any co-funding should facilitate a short to medium term (10 years) removal of SPL stockpiles.
- The SPL waste stream is highly toxic, corrosive, and reacts with water. If it is not carefully managed, SPL represents significant risk to human health and the environment. The risk of incentivising mis-management of SPL needs to be carefully considered. There have been a number of financially unsuccessful attempts to process SPL in the past. Co-funding should only be available for management options that are proven.

Figure 9 and Figure 10 below, illustrate two potential funding models that, should any co-funding become available, could provide effective incentive for SPL stockpile drawdown whilst considering the points noted above.

The Figure 9 model of co-funding smelters would be most practical if agreements (either voluntary or binding) were in place between the smelters and state/federal government/s for the SPL stockpile drawdown. This model would allow state/federal government more strategic control of which stockpiles drawdown received co-funding.

The Figure 10 model of co-funding of SPL WMPs would be most practical if no, or few, agreements were in place with smelters and state/federal government/s for SPL stockpile drawdown. The co-funding model could be simpler to administer and simply co-fund an amount per tonne for SPL managed (for approved SPL WMPs only).

[65] The options presented in this section are not endorsed by the Australian or State Governments nor do they represent government policy.

**Figure 9 Co-funding of smelters model to clear SPL stockpiles**

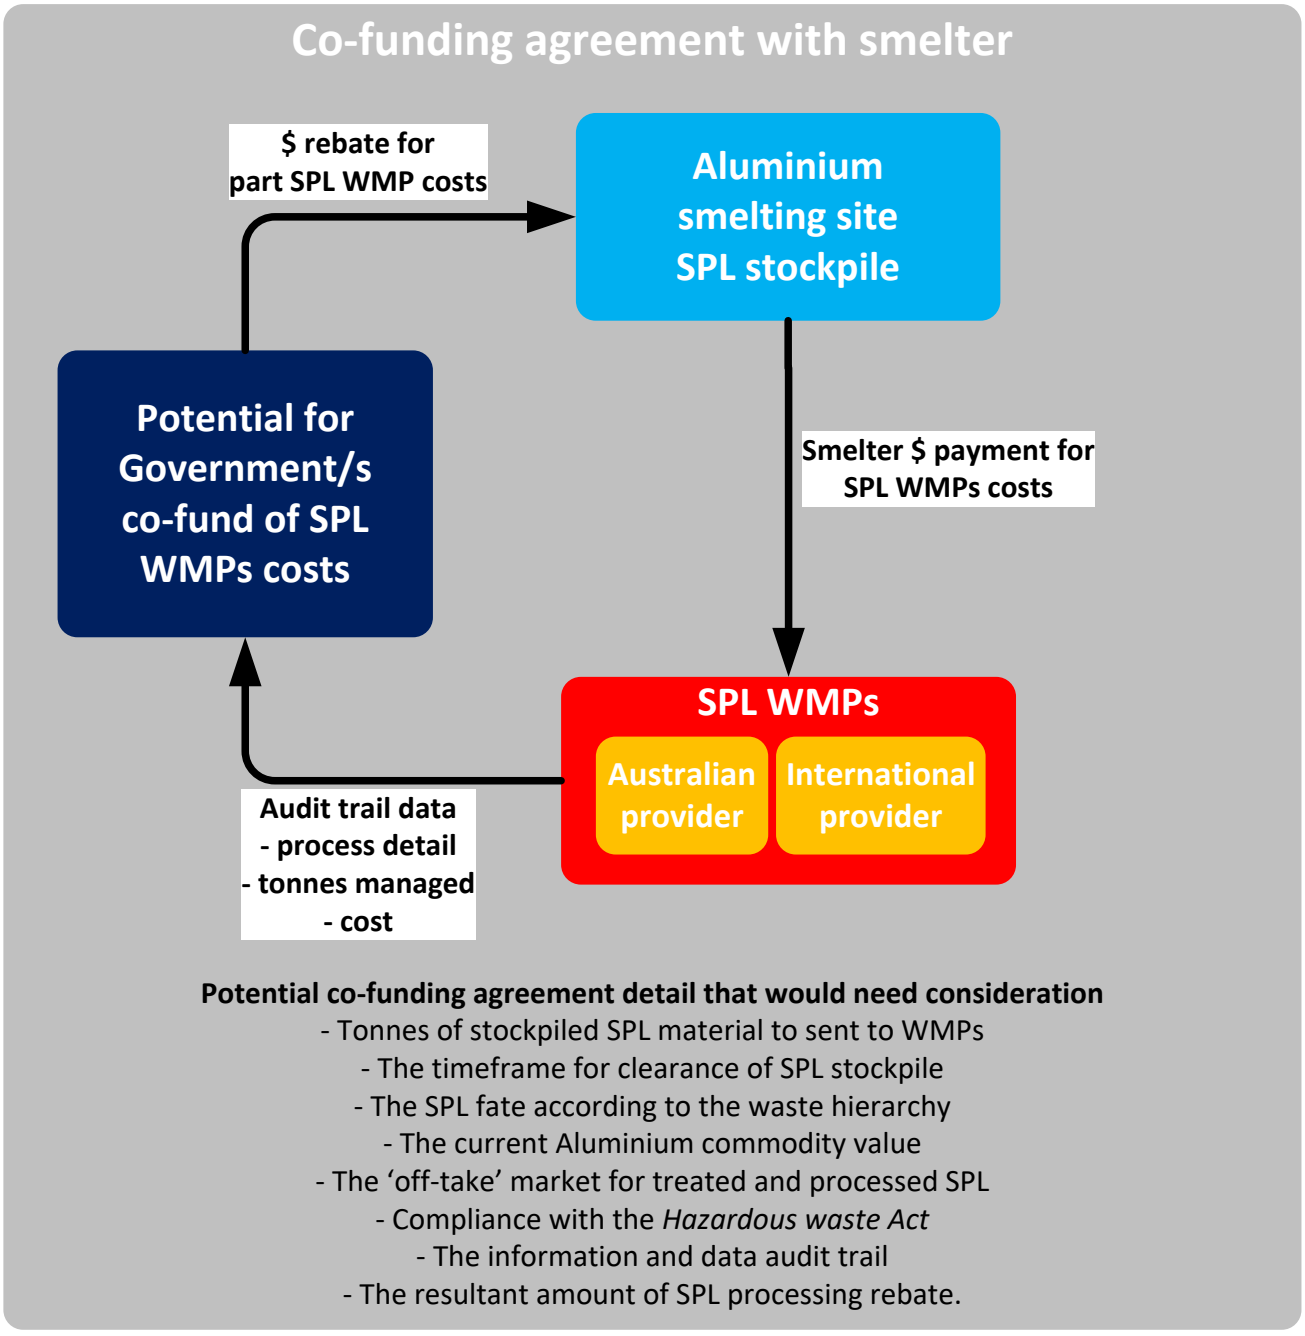


**Figure 10 Co-funding of SPL WMPs model to clear stockpiles**

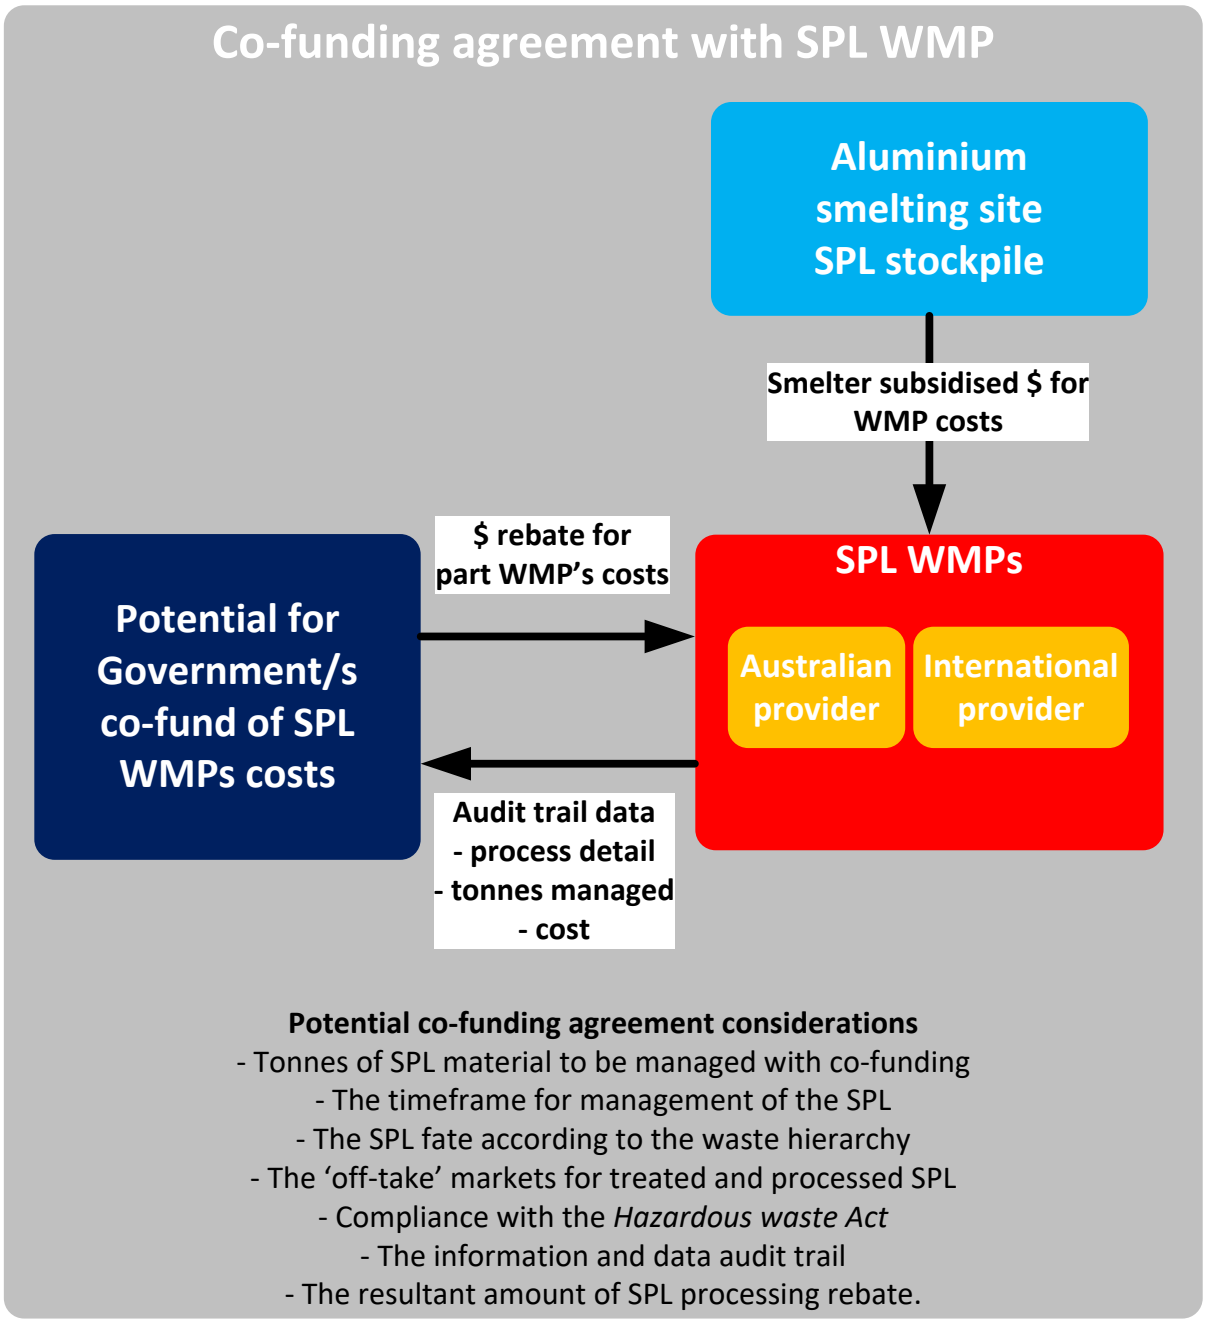

## 10.1 Other co-funding options suggested during consultation

The following co-funding option has been suggested:

> "Potential to look beyond a 'subsidised processing' model and look to an industry-government co-funded processing solution (i.e. build, own, operate) with future processing/transport pricing agreed and fixed for 10 years. Advantage of all parties having the security of knowing final fate and cost of addressing SPL stockpiles until they are fully depleted and industry only has to address annual arisings. There would also be the advantage of eliminating geographical disadvantages of some smelters if they have fixed pricing that is the same for all smelters, regardless of location. This option could eliminate the external market forces that will always complicate the agreement option that relies on a market-driven approach. The processing solution may also be suitable for other types of problematic waste."

# 11 Conclusions

## 11.1 Aluminium production and new SPL arisings

Australia has four operational and two recently closed aluminium smelters and is currently producing about 1.65 Mt of aluminium per annum. The Aluminium smelters have estimated new arisings of SPL of 29,100 tonnes per annum.

## 11.2 Australia's SPL stockpile profile

Australia has a significant stockpile of SPL with a total of around 700,000 tonnes of SPL in either above ground or below ground storages (landfills) around Australia.

Just under half of Australia's SPL stockpile (about 310,000 tonnes) is stored in above ground stockpiles. Interesting there is a higher proportion of 1st cut SPL (about 114,000) than 2nd cut SPL (about 74,000) in these stockpiles. The high carbon content in 1st cut SPL has historically meant that there have been more processing options for 1st SPL cut than 2nd cut SPL. The largest portion of the above ground stockpile is mixed 1st and 2nd cut SPL (about 120,000 tonnes).

Slightly more than half of Australia's SPL stockpile (about 390,000 tonnes) is stored in landfills onsite at several sites around Australia. The composition of the landfilled SPL is not known, but is likely to be around 50-60% 1st cut and 40-50% 2nd cut SPL.

## 11.3 Site aboveground SPL stockpile drawdown plans

The following definition for an 'SPL drawdown plan' has been adopted for this report and analysis.

An 'SPL drawdown plan' is a plan that has at least 2 of the following:

1. The smelter can demonstrate a recent (i.e. the last 3 years) history of significant stockpile drawdown. It should be noted that, during consultation, several smelters provided data/charts that illustrate that in the last few years SPL stockpile processing rates have increased resulting in partial drawdown of existing stockpiles.
2. Commercial arrangements are in place between the smelter and SPL WMP/s that will result in the drawdown of SPL stockpiles and the management of any new SPL arisings.
3. The estimated timeframe for the drawdown of the SPL stockpile has been provided for this public summary report.

Of the six smelting sites in Australia, only Tomago Aluminium has a drawdown plan in place that will have all SPL stockpiles removed from the site well within a 10 year period.

Alcoa Portland also has a drawdown plan in place that is likely to result in all stockpiles removed in around 10 years.

Pacific Aluminium sites at Bell Bay and Boyne (BSL) have drawdown plans in place, however the plans may take up to 10 or more years to implement, depending on the SPL processing rates that are achieved in future.

At the time of writing we understand that the Alcoa Point Henry drawdown plan was still under development. The smelter is closed and undergoing site decommissioning to allow for future development.

At the time of writing we understand that the Hydro Kurri Kurri drawdown plan was still under development. The smelter is closed and undergoing site decommissioning to allow for future development. Hydro stated that they are planning for above ground SPL stockpiles to be recycled over the next 3 to 4 years.

## 11.4 Capacity of SPL WMPs

The capacity of Australia's currently operating SPL WMPs consists mostly of 'treatment and processing' facilities in Vic and NSW ( ). Cement kilns in Qld and Tas provide the remainder of the operational SPL WMP capacity.

The total licensed/process capacity of Australian SPL WMPs is estimated at around **100,000 tonnes per annum**.

The current export options for SPL management include mineral wool (Rockwool) manufacture in Germany and Befesa in Spain. Befesa recycle aluminium dross salt slags and other residues from dross recycling and use SPL to reduce energy input requirements. Australia has exported around 120,000 tonnes of SPL to European WMPs since the early 1990s and has a permit under consideration for another 6,000t to be exported. Research, presented in Section 6, indicates that there is significant capacity for SPL processing at Befesa and Rockwool. However, their 'spare capacity' to receive Australian SPL is unknown and would be subject to individual contract negotiations between the aluminium smelter and Befesa or Rockwool.

Australia may also soon have long term storage options available in the NT and WA where Tellus have proposed facilities, however, these facilities are yet to be licensed.

## 11.5 Considerations for any agreement

Stakeholder consultation and project research identified several important considerations for any SPL stockpile drawdown agreement to consider. They are listed below.

1. Aluminium smelting market conditions
2. The charges (fees) for SPL WMPs.
3. The site specific conditions including:
    a. The sites SPL stockpile profile
    b. Impacts on local environment and intended site afteruse
    c. Proximity of SPL WMPs.
4. Australian (State and Commonwealth) SPL legislative framework.
5. International SPL legislative frameworks and incentive programs.
6. State, national, and international SPL WMP's capacity.
7. The stability of 'off-take' markets for treated and processed SPL.
8. Local community engagement.
9. Parties to agreements.
10. SPL WMP competition and market considerations.

## 11.6 SPL waste management costs

The financial costs of SPL waste management are significant.

Industry has commented that historically SPL WMPs fees have been in the order of $1000/tonne. These costs have reduced significantly in recent years but still remain a significant consideration and concern for the smelting industry.

The liabilities/costs discussed above present costs to send SPL to a WMP. They are not inclusive of costs to manage other (non-SPL) landfilled materials or costs for other site remediation that could be required. These costs could be a significant addition to the total costs.

There are also costs[66] associated with maintaining SPL in landfills onsite (not removing the stockpile using a SPL WMP).

## 11.7 Australian SPL stockpile and new arisings versus SPL WMPs capacity

### 11.7.1 Above ground stockpile

The project analysis indicates that the Australian above ground SPL stockpile could theoretically be processed in four or more years (whilst continuing to process new arisings). **It is important to note that this theoretical drawdown timeframe is indicative only as there are several important considerations, as listed above, which may impact on the actual drawdown timeframe.**

Whilst noting these considerations, the comparison of above ground stockpile tonnages with national processing capacity indicates that it is possible for Australia's above ground SPL stockpile to be drawn down over a 10 year period (whilst continuing to process new arisings).

The analysis also indicates that there is sufficient processing capacity available in Vic and NSW to process SPL stockpiles within the nominal 10 year period that DoEE has identified.

The analysis for Qld and Tas indicates that these states have limited processing capacity beyond the tonnage of new annual arisings and would require more than 10 years to process the SPL stockpiles using local processing capacity alone. For Qld and Tas the analysis indicates that any agreement may

[66] The estimation of the costs associated with the landfilling of SPL is beyond the scope of this project.

need to consider interstate or international processing options or the establishment of additional local SPL WMP capacity.

### 11.7.2 Total stockpile plus annual arisings

**It is important to note that the decision to require processing of any landfilled SPL would be made by the relevant state government regulator.**

The processing of any landfilled SPL would also be subject to demonstration that the SPL removed from landfill is able to be processed. Contamination from non SPL wastes such as asbestos could prevent processing of some landfilled SPL.

For drawdown calculation purposes, the analysis indicates that, should it be required and technically feasible, Australia's total SPL stockpile and new arisings could theoretically be processed in eight or more years (assuming that 100% of landfilled SPL was processed) or in six or more years (assuming that 50% of landfilled SPL was processed).

## 11.8 Agreement options and agreement co-funding[67]

Whilst this project has identified a significant number of considerations and issues with SPL management, the project identified just three 'agreement options' that are discussed briefly below.

### 11.8.1 Agreement that 'no agreement' is needed

This may be the preferred approach where the smelter has an internally agreed SPL management plan in place and a clear timeline for the stockpile to be drawn down that has been effectively implemented over the past several years. The successful historical management of SPL would typically have resulted in a relatively small stockpile of SPL materials remaining onsite.

### 11.8.2 A voluntary agreement

Industry may consider entering into a voluntary agreement to demonstrate to the local community and to state regulators that a plan is in place that will ensure that SPL stockpiles are being responsibly managed. A voluntary agreement may also be required to be eligible for any co-funding of SPL WMPs costs.

### 11.8.3 A legally binding agreement

The use of statutory covenants by DoEE may be required as part of any co-funding of SPL WMPs costs. They could also be required where there is significant social concern that the SPL stockpile has no plan in place for removal or future management to ensure human health and the environment are protected. It is important to note that State Governments have existing powers under contaminated land and hazardous waste legislation that could also be used to enforce the 'clean-up' of SPL stockpiles.

Within the voluntary and legally binding agreement options, the project identified two models of co-funding including:

1. Agreement to co-fund the smelter for SPL WMPs costs (rebate to smelter)
2. Agreement to co-fund the third party SPL WMPs costs (e.g. rebate to SPL WMPs).

[67] The options presented in this section are not endorsed by the Australian or State Governments nor do they represent government policy.

During consultation, industry identified another co-funding model which was for the government to consider for the potential to look beyond a 'subsidised processing' models and look to an industry-government co-funded SPL processing solution (i.e. build, own, operate) with future processing/transport pricing agreed and fixed for 10 years.

## 11.9 The feasibility of an agreement based approach to SPL stockpile drawdown

This project aimed to test the feasibility of using an agreement based approach to drawdown Australia's SPL stockpile over a period of around 10 years.

**The analysis indicates that it is feasible to use an agreement based approach to develop site-specific agreements with the aluminium smelting industry, SPL WMPs, and Australian governments that could enable SPL stockpile drawdown in around ten years.**

The agreement type (voluntary or binding), parties, and any potential co-funding would need detailed consideration that is beyond the scope of this project.

# 12 Recommendations

The following is recommended.

1. DoEE progress with discussions with all Australian aluminium smelters and SPL WMPs to develop site specific agreements that will help ensure the drawdown of above ground SPL stockpiles over the next 10 years. Whilst Tomago Aluminium has a short drawdown plan in place, they should still be consulted, at least initially, to ensure they are not disadvantaged for proactively processing their SPL stockpile.
2. DoEE maintain communication with the relevant state EPAs to monitor the outcomes of current assessments/audits of onsite SPL landfills.
3. Should landfilled SPL be required to be removed from site and/or processed, DoEE should look to include the additional tonnages into any agreement this is being considered.
4. The development of any agreement includes full assessment of the considerations that are included in Section 7 of this report. Included in this assessment should be a confirmation of the stockpile tonnage figures for each site that were provided for this report.
5. Where any agreement potentially includes co-funding that DoEE ensure that the considerations included in Section 10 are fully assessed.
6. If co-funding is being considered as part of an agreement, DoEE should undertake additional analysis of the historical and current 'baseline' pricing for SPL WMPs. The indicative pricing information gathered during this project is insufficient to support decisions regarding the amount of co-funding that should be provided per tonne (for example).

To whom it may concern

Regain Services Pty Ltd (the proponent) is submitting an application to the Department of Planning & Environment to modify the existing Project Approval (06_0050) to increase current plant throughput from 20,000tpa to 60,000tpa for the Tomago SPL Recycling Facility located at Tomago, NSW. The facility is located on land owned by the Tomago Aluminium Company.

The property is identified as the Regain Services Pty Ltd site, located within the Tomago Aluminium site at 576-638 Tomago Road, Tomago, NSW, 2322. The title is listed as Lot 3 in DP 808004, Tomago Road, Tomago.

The property area is a stand-alone lease by Tomago Aluminium Company Pty Limited to Regain Services Pty Limited.

As the owner of the property described above, I consent to the application being made by the Proponent (Regain Services Pty Ltd) understanding that the application is subject to all normal planning requirements.

Steve McIntyre

CFO & Company Secretary
Tomago Aluminium Company Pty Limited

# Appendix J

## Hazard and Risk Management Standards

# Appendix J Hazard and Risk Management Standards

# Hazard and Risk Management Standard

## Objective

Risk is eliminated or minimised so far as is reasonably practicable.

## Explanation

A hazard is a source of potential harm or damage that can cause a loss. Risk is defined as the probability of a loss. Risks are eliminated so far as is reasonably practicable. Where it is not reasonably practicable to eliminate risks, then those risks are minimised so far as is reasonably practicable. Reasonably practicable means realistic, practical and able to be done after considering:

- hazards and credible potential losses
- the options for preventing or mitigating losses
- what the people concerned know or should expected to know.

Regain applies this framework for safety and environmental risk management and for other aspects of is business where there is a risk of substantial loss. The underlying approach is to (a) avoid events that could cause loss (loss events); or (b) to mitigate the extent of harm or damage if a loss event does occur. Risk controls provide (a) protection barriers in the form of controls such that loss events are avoided; or (b) mitigation controls to limit the extent of damage or harm if a loss event actually occurs. Monitors are measures that indicate that a control is in place.

## Requirements

### Hazard Identification and Risk Control

Hazards and risk controls are systematically identified and documented through:

- Hazard and Operability Studies (HAZOPs) for process plants
- Hazard and Loss Event Prevention Analysis (HAZLEPs) for activities
- Work Planning for tasks including plant operations and maintenance
- Hazard and Incident reporting for use by employees, contractors and visitors.

### Hierarchy of Controls

Controls are prioritised and implemented in accordance with the following hierarchy of controls with preference given to the controls at the highest level.

1. Elimination – eliminate the hazard where it is reasonably practicable to do so
2. Substitution – substitute the equipment or method with an alternate approach that is less hazardous
3. Engineering – implement engineering solutions to isolate the hazard
4. Administrative – implement administrative procedures such as safety rules
5. Personal Protective Equipment – wear body protection equipment such as safety glasses.

### Consultation

Front line workers, Health and Safety Representatives and other stakeholders are consulted on hazards and control measures. A key feature of consultation is an emphasis on involvement of people through respectful face-to-face conversation.

### Reinforcement of Awareness and Mindfulness

Hazard and control awareness and mindfulness are fostered with the people involved in work using Work Planning Forms and Safe Work Checksheets at the start of each task. Documents used by front line people are written at a literacy level and in a style that is relevant and engages the front line people.

### Review

The adequacy and effectiveness of hazard and risk management documents are reviewed periodically as follows:

- HAZOPs – During plant design and on major changes to process plant
- HAZLEPs – at least once in two years
- Work Planning Forms and Safe Work Checksheets – at least once every year
- Hazard and Loss Prevention Charts and Controls Register – at least once every year.

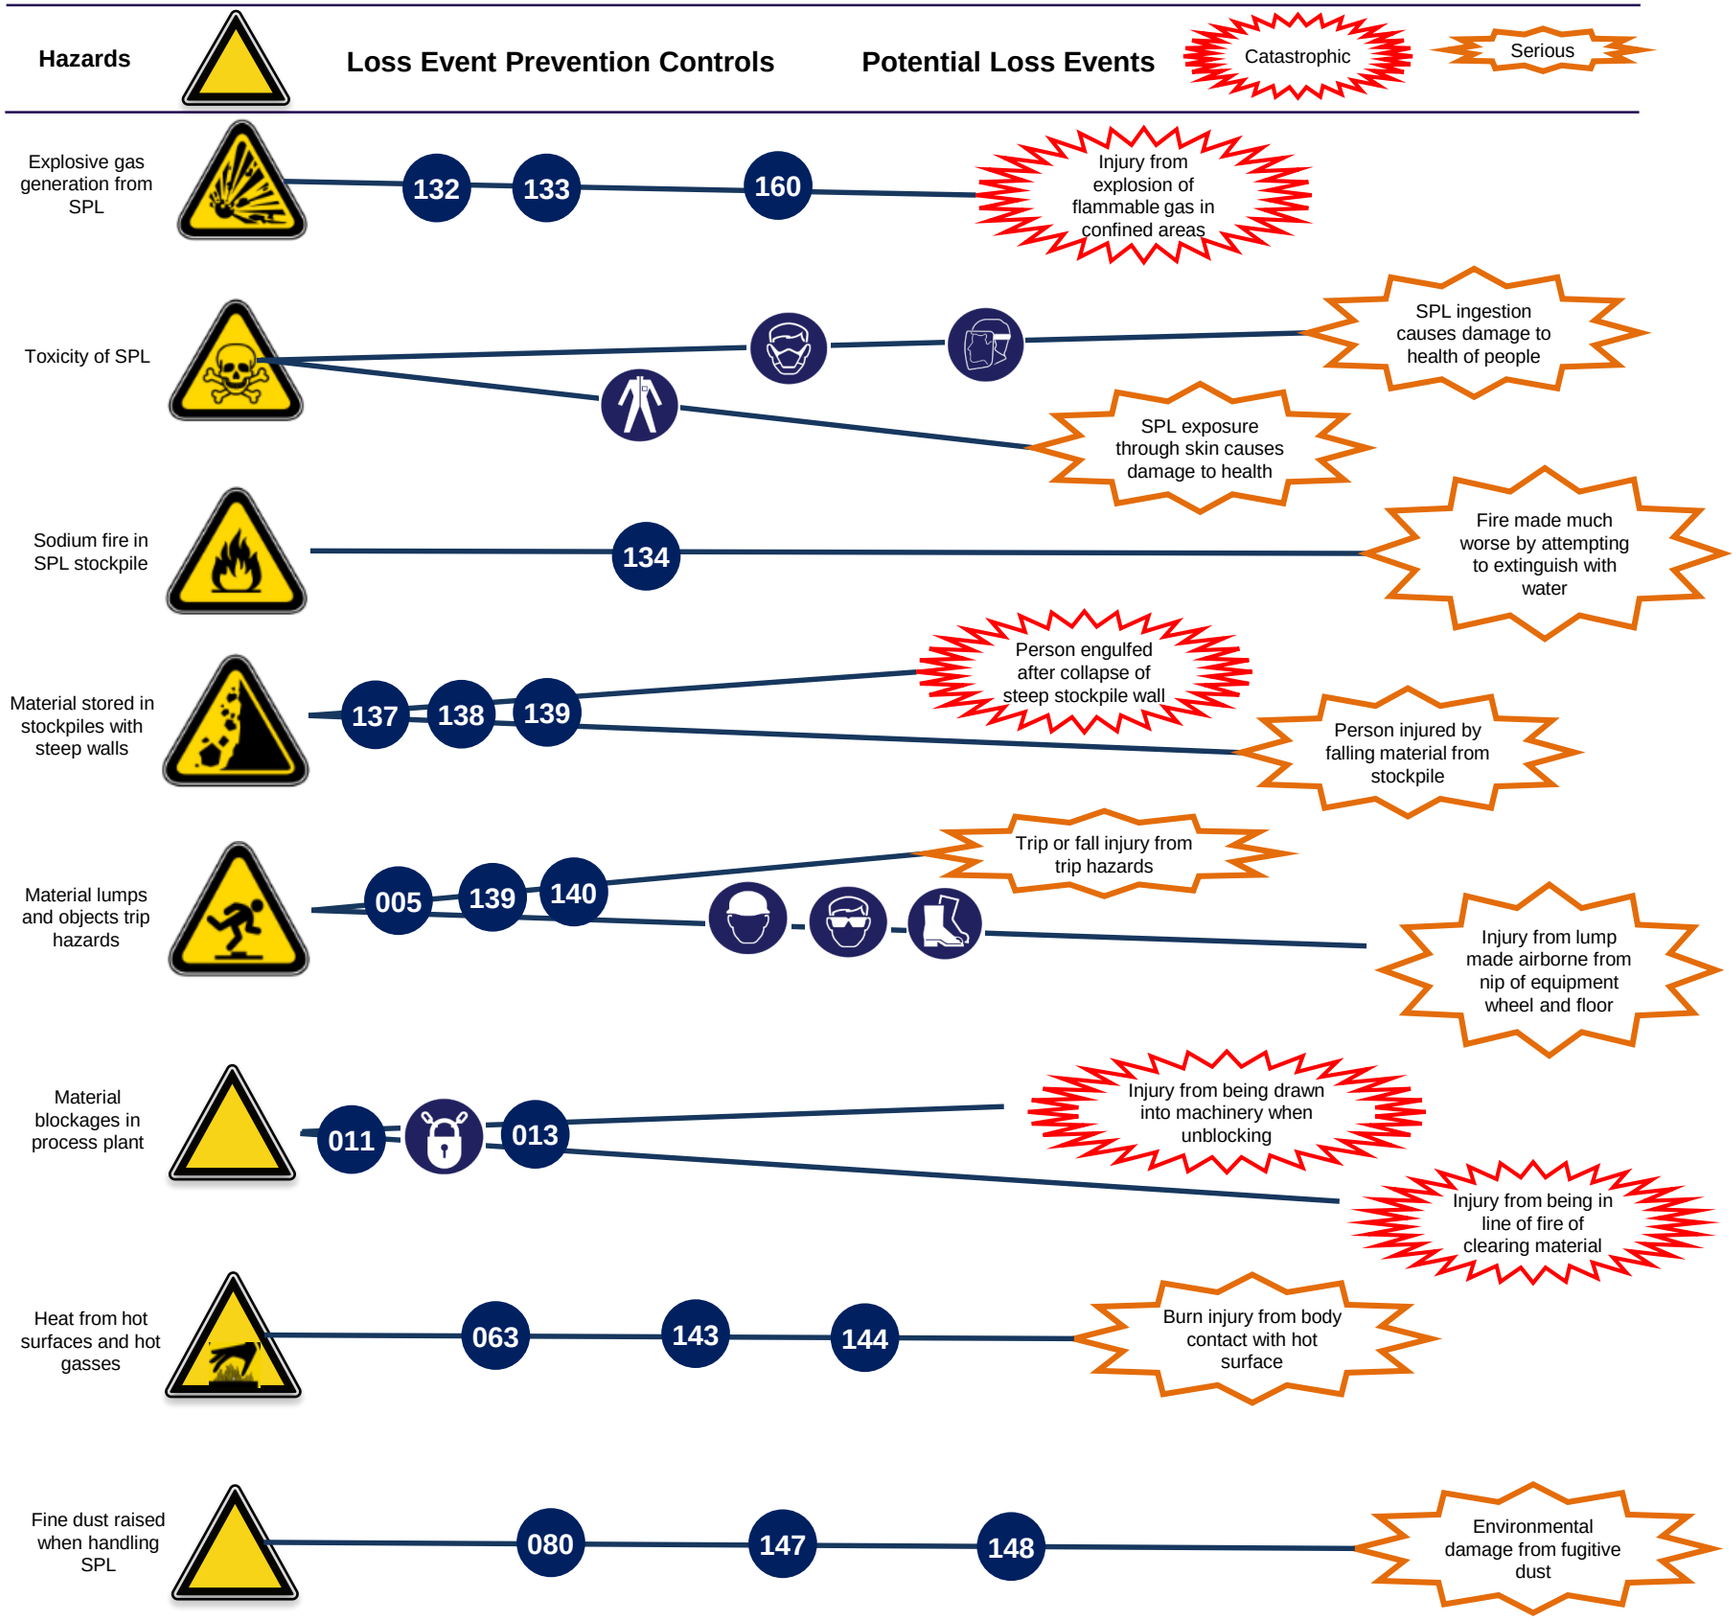
# Material Handling and Processing



## Control Codes and Descriptions

- **005** Barriers and signage prohibiting entry while mobile equipment is operating
- **011** Turn plant off and do not operate
- Plant isolation lock out tag out
- **013** Clear process blockages from concrete floor or behind handrail on platforms
- **016** Signage warning to isolate plant before opening hatches that may expose hazard
- **042** Signage warning of confined space hazard and authorised entry control
- **063** PPE – Cotton clothing – long sleeve shirt with sleeves down and long trousers
- PPE – Disposable overalls with head cover
- PPE – Safety helmet
- PPE – Safety eyewear
- PPE – Safety boots
- PPE – Face mask - Rubber
- PPE – Face mask – Full face
- **080** Keep material damp to reduce dust
- **132** Periodic monitoring for explosive gases
- **133** Periodic maintenance inspection of hydrogen gas vents
- **134** Signage to warn against using water to quench sodium fires in SPL stockpiles
- **137** Stockpiles dressed to natural angle with no steep slopes or large lumps that may fall
- **138** Housekeeping check – steep slopes on stockpiles that may collapse or large lumps that could fall
- **139** Mobile equipment travel paths scraped clear regularly
- **140** Housekeeping check – material on mobile equipment pathways
- **143** Guard hot surfaces
- **144** Signage warning of hot surfaces
- **147** Truckloads covered when transporting bulk materials / products
- **148** Handle dry bulk materials inside buildings
- **160** Hydrogen gas vents on unventilated plant high points

# Appendix K

## Material Control and Chain of Custody Standard

# Appendix K Material Control and Chain of Custody Standard

# Material Control Standard

## Objective

Accurate measurement and control of materials handled by Regain.

## Explanation

Regain processes certain by-products from aluminium smelting operations and other materials at the various process plants. Accurate measurement and control of quantities of material is essential for effective operation of the Regain business. As part of meeting its commercial and statutory obligations, Regain is required to record material movements, reconcile quantities and provide a reports including mass balance of materials, inventory on hand, quantity of material processed and products shipped.

## Requirements

### Records of Material Movements

Material mass balance is controlled by recording and measuring the weight of materials into, through and out of the Regain system of material receiving, handling, processing, product manufacture and delivery to Customers. Under the Regain Management System (RMS) all controlled material transactions are covered by a dispatch docket. Material movements, or material transactions, based on Regain dispatch dockets are input to and stored on an electronic database. All material transactions are matched to mass balance accounts. Material is received by Regain at its operations and typically stored in stockpiles. Material is drawn from the stockpiles and then controlled through production batches. Transformation from one material to another is controlled against production batches.

### Mass Balance Accounts

A mass balance account represents the combination of a single product or material and a point of control for that material. Material transactions are matched to mass balance accounts:

1. **Origin mass balance accounts** record materials entering from outside the Regain system.
2. **Stockpile mass balance accounts** record the movement of material into and from a stockpile at a given Regain operation.
3. **Batch mass balance accounts** provide a record of the material transfers into a given batch and transfers from the batch.
4. **Destination mass balance accounts** record outgoing final product transactions for materials leaving the Regain system and handed to the custody of end user Customers.
5. **Adjustment mass balance accounts** records losses and gains in material mass as material is handled and processed with an offsetting record of the loss or gain recorded against the appropriate stockpile or batch.

### Mass Balance Equation

Mass balance control is achieved using the following mass balance control equation.

| Quantity of Material Received from Origins | - | Quantity of Material in Stockpiles | - | Quantity of Material in Batches | - | Quantity of Outgoing Material Dispatched | + | Adjustments | = 0 |
|---|---|---|---|---|---|---|---|---|---|

### Quantity Reconciliation

Quantities of materials are reconciled with weights recorded using a weighbridge that has been properly calibrated and for which there is a current certificate of approval.

### Review

The adequacy and effectiveness of this Regain Material Control Standard are reviewed by Regain Management periodically on a three-year cycle and/or earlier in a given cycle if circumstances indicate an earlier review is appropriate.

Copyright © Regain 2015

# Chain of Custody Standard

## Objectives

A. Clear identification of title and risk in the materials handled by Regain,

B. Traceability of materials and products.

C. Assurance that Regain's obligations as owner of materials are met.

## Explanation

The supply chain of products including all stages from receipt of by-products from aluminium smelting operations, processing by Regain, production of new products, storage and transport of products up until the release of the products to Customer for consumption is referred to as the **chain of custody**. A **chain of custody stage** is a point at which ownership or control of material changes. **Traceability** refers to ability to trace back the product or raw material back to the Client who supplied the material and forward to the Customer who accepted the products for consumption.

As part of meeting its commercial and statutory obligations to aluminium smelter Clients, product Customers and government regulators, Regain must to be able to provide evidence of quantities, chemical analysis and transfer dates relating to the movement of raw materials and products. It is also required to have appropriate documentation of commercial arrangements that define a chain of custody stage where ownership in a product is transferred to another party along with records that support each commercial transaction.

Regain must ensure that materials under its control are stored and transported in accordance with appropriate regulation.

## Requirements

### Material Safety Data Sheets

Material Safety Data Sheets are available for each of the materials (including products) that are under Regain control.

### Product Specification

Each consignment contains products that meet a specification recorded in the commercial agreement between Regain and the Customer who takes delivery of products for consumption.

### Traceability

The source(es) of material for each batch are known. Each consignment of product is made up from one or more identified batches of product that meet the required product specification.

### Storage and Transport

Raw materials and products are stored and handled in accordance with appropriate regulation and in accordance with commercial agreements with other parties.

### Change of Custody Stages

The point at which ownership and risk is transferred to Regain is defined in commercial agreements with Clients who supply by-products and with Suppliers who provide other materials. The point at which ownership and risk is transferred from Regain is defined in commercial agreements with Customers who take delivery of products for consumption.

### Chain of Custody and Material Control Reconciliation

The quantities shown on Regain commercial invoices to Clients and to Customers are periodically reconciled with material mass balance control records.

### Review

The adequacy and effectiveness of this Regain Material Control Standard are reviewed by Regain Management periodically on a three year cycle and/or earlier in a given cycle if circumstances indicate an earlier review is appropriate.
