# Executive Summary

## Introduction

This Environmental Assessment (EA) has been prepared for Regain Services Pty Ltd (Regain) to accompany an application under Section 75W of the *Environmental Planning and Assessment Act 1979* (EP&A Act) to modify its existing Project Approval 06_0050. The modification would allow Regain to increase the capacity at Regain's existing Spent Potlining (SPL) Facility at Tomago, NSW (the Project).

Aluminium production is a continuous process where molten aluminium is produced within a refractory lined 'pot'. During the production process, the potlinings become contaminated with materials such as alumina, aluminium, calcium, fluoride compounds and sodium. The contaminated potlining, known as SPL is regularly replaced as part of the periodic individual rebuilding of the pots.

The SPL is classified as a Dangerous Good and an Environmentally Hazardous Waste. It requires careful handling and disposal in accordance with regulatory requirements. SPL materials are currently stored at Tomago smelter in a number of secure, dry storage sheds prior to disposal. Historically, SPL has been shipped internationally for processing. It is estimated that approximately 700,000 tonnes of SPL exists in storages around Australia and that around 36,000 tonnes of SPL is generated per annum (REC, 2016).

Regain has worked with a number of aluminium smelters in Australia to recycle minerals from a range of smelter wastes to develop products that would be valuable to other industry sectors. Regain has recycled more than 350,000 tonnes of waste from four aluminium smelters in Australia diverted from the waste stream and transformed into products over the last 20 years.

The Project would provide for an increase in processing capacity at the existing facility to 60,000tpa without significantly increasing the risk profile and the environmental impacts of the existing approved development. This provides the opportunity to assist in the processing of SPL wastes currently being stockpiled throughout Australia, thereby decreasing the time taken to reduce these substantial stockpiles.

The Regain SPL processing facility currently processes up to 20,000tpa of SPL. The facility is located within the footprint of the Tomago Aluminium smelter site which is approved to produce up to 600,000tpa of aluminium. The existing Regain operated facility is a proven success with Tomago Aluminium celebrating the successful treatment of the last of the company's SPL to have been stored in purpose built long term storage facilities on site in November 2017. However as aluminium production continues to grow, so does the need for a sustainable SPL processing solution. Aluminium production at Tomago Aluminium has increased steadily from an estimated 525,000 tonnes in 2008 to 585,000 tonnes in 2016. This places increased demands on Regain's existing local services and supports the continued viability of the Project.

## Proposed Modifications

The SPL processing facility currently process up to 20,000 tonnes per annum (tpa) of SPL material. The recycled waste product is reused by other industries (e.g. primarily the cement industries) as a fluxing agent. The Project involves increasing the handling capacity of the facility from 20,000 tpa to 60,000 tpa using improvements to the existing proven technology, in order to respond to market demand. The Project would reduce the potential for SPL stockpiles to accrue, while also ensuring the operational efficiency of the facility into the future.

To achieve a 60,000tpa processing rate an additional thermal treatment plant capable of processing up to 40,000tpa would be installed at the existing Regain facility. The originally proposed plant configuration would be rationalised, recognising improvements in technology and a simplified product inventory. Therefore the proposed modifications retain the general physical scale of the previously approved plant configuration.

Additional stormwater controls would be installed which would provide improved opportunities for stormwater capture, reducing pressure on the existing Tomago Aluminium stormwater services.

Existing site practices would remain generally unchanged with existing material handling practices and environmental controls either remaining in place or being improved based on site experiences.

As the Regain facility is located within the smelter a number of facilities are shared, including site access points, stormwater systems and services. The Tomago Aluminium smelter operates a comprehensive environmental monitoring program which is commensurate to the scale of the operation.

## Environmental Impact Assessment

The environmental assessment considered nearby sensitive receptors including (but not limited to):

- The Botanic Gardens approximately 2.6km to the north west;
- The Tomago Sandbeds Catchment Area 0.5km to the north;
- Tomago Bowling and Sporting Club approximately 0.6km to the south; and
- Tomago Village Van Park located approximately 1.6km to the west.

The following key environmental issues relating to the Project were assessed:

### Air Quality

To determine the potential impacts arising as a result of the Project in addition to the site's existing operations, an Air Quality Impact Assessment (AQIA) was prepared. A conservative assessment method was utilised to review potential incremental and cumulative impacts of the Project based on proposed maximum pollutant emission limits.

The results indicated that when operation of the facility is considered in isolation a substantial change in levels of pollutants predicted at sensitive receptors was considered unlikely. Pollutant concentrations at surrounding sensitive receptors are expected to be low. Air quality modelling predicted that elevated concentrations of Hydrogen Fluoride may occur at nearby industrial receptors under certain circumstances. However these findings are strongly influenced by surrounding industrial operations with actual contributions generated by the Project being low.

A buffer zone was designated during the approval process for the third potline at Tomago Aluminium to accommodate an annual emission equivalent to 298 tonnes of total fluoride per year. A review of emissions from the Tomago Aluminium smelter between 2012 and 2017 identified that annual fluoride emissions ranged between 240 to 280 T/yr with a substantial reduction in recent years (towards 240T/yr). The maximum potential Regain contribution to the annual fluoride load on the buffer zone was predicted to be less than 3 T/yr. It is therefore considered unlikely that the small potential increase associated with the Project would adversely affect the condition of vegetation or soils in the Botanic Gardens (located approximately 2.6km from site), or water quality within the Tomago Sandbeds, or surrounding areas within the buffer zone.

### Hazard and Risk

The requirements of State Environmental Planning Policy 33- Hazardous and Offensive Development were used to assess the potential hazards and risks of the proposed modifications to the Project. There is no change in the dangerous goods storage status of the facility. A gap analysis and preliminary screening analysis concluded that the potential hazards associated with the Project are not anticipated to change the existing risk profile of the facility.

### Human Health

A Human Health Risk Assessment (HHRA) was prepared to assess the potential human health risks to surrounding off-site human receptors as a result of air emissions from the Project. The HHRA concluded that under both typical operations and proposed maximum emission limit conditions the estimated health risks to humans from vapour and particulates emitted from the facility was considered low and acceptable.

### Traffic and Transport

Heavy vehicles access the facility via the Tomago smelter site using the Pacific Highway which provides regional connectivity. The additional heavy vehicle movements generated by the Project are

expected to result in a 3% increase in total heavy vehicle movements to and from the Tomago Aluminium smelter site. When compared to existing traffic movements along the Pacific Highway, truck movements generated by the Project would account for approximately 0.03% of all total truck movements. There would be no additional passenger vehicle movements associated with operation of the modified facility, as the existing workforce is not expected to change. The facility would have minimal impact on existing traffic, intersection or road network capacity.

**Soil and Water Quality**

The Project would provide improved opportunities for stormwater control through the addition of a second first flush system. The Project would not result in any substantial alteration to existing hardstand areas or impervious surfaces and would improve existing environmental controls and performance. The risk to surface water and groundwater quality is therefore considered low based on the additional environmental controls proposed.

**Waste Recycling**

The SPL processing facility not only fully recycles a waste material, but also generates end-products that reduce the generation of greenhouse gas emissions and the consumption of fuel and raw materials in the brick and cement industries. The Facility's operational processes do not generate raw SPL material or by-product wastes.

All raw materials would be processed at the Facility. SPL materials and recycled products are currently stored on site within existing purpose built buildings. Waste handling activities are undertaken in accordance with the site Environmental Management Plan which identifies specific material handling and processing procedures and controls to mitigate hazards and risks associated with handling an Environmentally Hazardous Waste.

## Conclusion

In summary this EA has assessed the potential impacts that may arise as a result of the proposed modifications. The increase in throughput would result in a modified layout to that anticipated in the 2009 EA whilst retaining the physical size and scale of the originally approved Project.

The EA demonstrates a number of positive environmental benefits associated with the SPL recycling process including:

- Substantial reductions in Scope 3 Greenhouse Gas Emissions within the cement industry by providing a three times greater reduction in $CO_{2\text{-}e}$ emissions of approximately 138,300 $CO_{2\text{-}e}$ (tonnes) based on current lifecycle analysis.
- Waste resource recovery benefits such as diverting waste from landfill and managing problem wastes in better ways.
- Consistency with the objectives of the NSW Waste Avoidance and Resource Recovery Strategy 2010-2021.

The EA demonstrates a strong project need for the proposed increase in processing capacity based on substantial stockpiles of SPL which have accumulated in Australia. It is estimated that approximately 700,000 tonnes of SPL exists in storages around Australia and that around 36,000 tonnes of SPL is generated per annum (REC, 2016).

It is considered that the Project (as modified) would remain substantially consistent with existing site processes, as previously approved. The existing site management measures are considered generally sufficient to appropriately manage the potential environmental impacts associated with the entire development on the site (the existing facility and the proposed modifications) as the environmental impacts and risk profile of the total development are not expected to change significantly. However additional specific mitigation measures have been identified where appropriate in the EA. The mitigation measures outlined in this EA and the existing site Environmental Management Plan would be used to guide the ongoing operation of the facility.

It is considered that the environmental consequences resulting from construction and operation of the Project (as modified) are expected to remain substantially the same when compared to the currently approved Project and that the project may be determined accordingly.

This page has been left blank intentionally.

# 1.0 Introduction

## 1.1 Purpose of this Document

This Environmental Assessment (EA) has been prepared by AECOM Australia Pty Ltd (AECOM) on behalf of Regain Services Pty Ltd (Regain) to accompany an application under Section 75W of the *Environmental Planning and Assessment Act 1979* (EP&A Act) to modify its existing Project Approval 06_0050. The modification is for the proposed capacity increase at Regain's existing Spent Potliner (SPL) Facility at Tomago, NSW (the Project).

Regain briefed the Department of Planning and Environment (DP&E) in August 2017 regarding the Project and the proposed modifications. Advice received from DP&E on 20 December 2017 confirmed that a modification to the Project Approval can be sought under section 75W of the EP&A Act, and provided the Environmental Assessment Requirements (EARs) for the Project. A copy of the EARs is attached at **Appendix A** and summarised in **Section 5.1**.

## 1.2 Background

### 1.2.1 Facility Location

The SPL Processing Facility is located within the existing Tomago Aluminium smelter site – a 500 hectare site located on the NSW east coast around 13 km northwest of the central business district of Newcastle. The site is within the Port Stephens Local Government Area (LGA), on Tomago Road, Tomago (see **Figure 1**). The smelter is close to the North Arm of the Hunter River, and is also in the vicinity of the Kooragang Nature Reserve and the Tomago Sandbeds Water Supply Works.

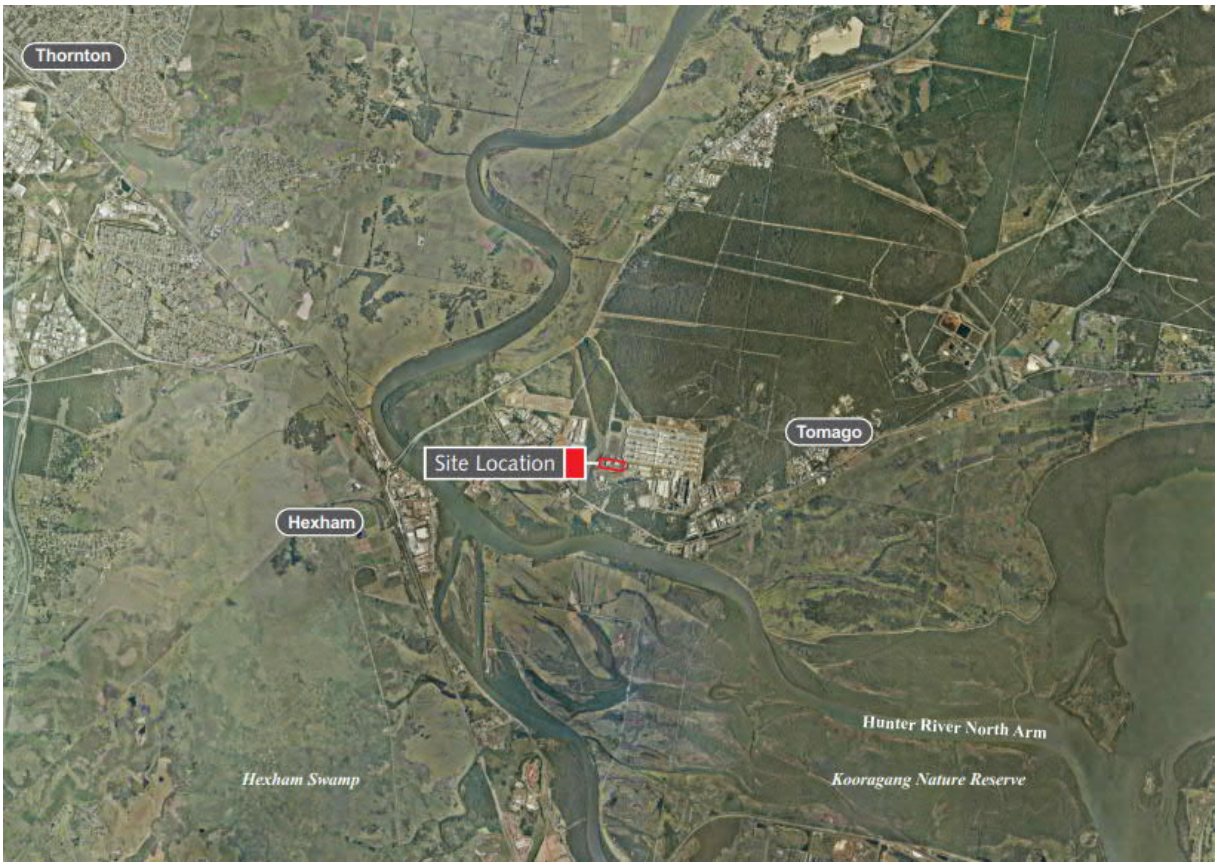

**Figure 1 Facility Location**

### 1.2.2 Existing Approvals

An Environmental Assessment (EA) was undertaken in 2009 (ENSR AECOM, 2009; hereafter referred to as the 2009 EA) to assess the potential impacts associated with construction and operation of an SPL Processing Facility. The Project was approved on 7 August 2009 (Project Approval 06_0050) under the EP&A Act by delegation of the Minister for Planning.

The Facility currently operates in general accordance with Project Approval 06_0050, Environmental Protection Licence 13269 issued under the *Protection of the Environment Operations Act 1997* (POEO Act) and Environmentally Hazardous Chemicals Licence #88 issued under the *Environmentally Hazardous Chemicals Act 1985* (EHC Act).

An administrative modification of Project Approval 06_0050 (Mod 1) was granted on 16 November 2016 to remove restrictions on the source of suppliers of SPL waste. The SPL Processing Facility is currently approved to treat up to 20,000 tonnes per annum (tpa) of SPL. Opportunities to enhance the operational efficiency of the facility have been identified and modification of the existing Project Approval is therefore being sought to provide for these alterations and an increase in production to 60,000tpa.

## 1.3 The Applicant

Regain Services Pty Ltd (Regain) is a Hunter-based mineral trading and processing company that focuses on mineral products manufactured from aluminium smelter by-products. Regain has worked with a number of aluminium smelters in Australia to recycle minerals from a range of smelter waste products (including bake furnace and cast house refractory wastes, spent anodes and SPL) to develop products that would be valuable to other Australian industry sectors. Products produced include fuel and minerals for cement manufacturing, and flux for use in brick kilns.

Regain has 20 years of demonstrated experience recycling aluminium smelter waste products into beneficial products. During this time Regain has recycled approximately 350,000 tonnes of SPL into a useful additive material for industry.

# 2.0 Description of the Project

## 2.1 Proposed Project

The Project is for the modification of the existing Part 3A Approval (06_0050) for the Tomago SPL Processing Facility (the Facility). Modification of the existing approval is proposed to provide for:

- **Plant modifications:** Opportunities have been identified to enhance the operational efficiency of the existing facility by altering the originally proposed site layout and key plant components; and
- **Facility production increase:** To ensure operational efficiencies and for Regain to meet market demand, modification is sought to increase current production from 20,000tpa to 60,000tpa.

The Project is to modify an existing SPL processing facility on site at Tomago Aluminium smelter which reduces the hazardous nature of a waste material through thermal treatment thereby recycling a waste material into a useable end-product.

The Project (as modified) would generally comprise:

- Materials preparation: This would involve SPL crushing and sizing, and would be located in Shed 5. Quantities of SPL would continue to be contained within Shed 5. No modification to existing material preparation processes is proposed as a result of this modification;
- Thermal treatment: This would involve a heat treatment process which would destroy the cyanide and neutralise the flammable gas hazard associated with SPL while retaining valuable materials such as carbon, fluorides, and other inorganic compounds. Thermal treatment would occur between Shed 5 and Shed 6;
- Product preparation: The product plant would involve drying and grinding treated SPL to suit product specification. Product plant elements would be located between the two existing buildings;
- Containment of materials: SPL would continue to be contained in Shed 5. Treated product would be stored in Shed 6; and
- Daily truck movement to and from the site for unloading SPL material for treatment and loading for delivery and distribution of treated products via road trucks.

A site layout of the Project (as modified) is shown in Figure 2.

To reach the target capacity of 60,000tpa it is proposed to operate an optimised configuration utilising the thermal treatment process elements of both the originally proposed project and an additional thermal treatment plant. The proposed Project would also provide an optimised product inventory based on market demand, removing the need for a blending plant (as originally proposed).

The modifications proposed as part of the modified Project would require capital investment of up to $15 million.

All of the materials preparation, SPL crushing, sizing, and storage facilities, would be located within Shed 5. No modification to existing SPL material preparation practices is proposed as result of this modification. SPL processing and product plant elements would be located between Shed 5 and Shed 6 as proposed in the original Project approval. The construction and operation of plant elements remains consistent with the process described in the 2009 EA.

The physical presentation of the Project elements remain consistent with the scale of the originally proposed development which was described in the 2009 EA:

- *Each of the sheds are 11 metres in height and have a floor area of 2,750 $m^2$. Each is constructed of steel, has aluminium sheet metal walls, roof cladding, and floors of steel reinforced concrete. The north and south walls of the sheds are fitted with louvre type ventilation panels. There are two doorways per shed.*
- *The proposed new treatment plant facility would be approximately 30m above ground level (at maximum stack height).*

Therefore the increase in throughput would result in a different operating configuration to that anticipated in the 2009 EA whilst retaining the physical size and scale of the originally approved Project.

### 2.1.1 Summary of Modifications

The proposed modifications retain the general physical scale of the previously approved plant configuration. A summary overview of the proposed physical modifications compared to the originally proposed Project is provided below:

**Table 1 Process Plant Comparison**

| Current Approved Plant | Proposed Plant Modifications |
|---|---|
| SPL Preparation Plant in Shed 5 | The internal layout would remain consistent with the existing approval. Modification is not required. |
| 20,000 tonnes per year Thermal Treatment Plant | The existing 20,000 tpa Thermal Treatment Plant would be retained and an additional 40,000 tpa Thermal Treatment Plant installed to reach the target processing rate of 60,000tpa. |
| Blending, drying and grinding equipment, grinding feed bin and four large product bins integrated in the Grinding and Blending Plant | The proposed modifications would result in a reduction in size with:<br>• no Blending Plant<br>• A separate Drying Plant and<br>• Fine grinding Plant with feed bin<br>• A single product bin |
| The thermal treatment plant and product plant would be located between Shed 5 and Shed 6. | The thermal treatment plant and product plant elements would remain between Shed 5 & 6. |
| A single stormwater catchment system | Additional stormwater catchment systems are proposed, providing opportunities for improved stormwater capture and control. An existing area of semi-permeable hardstand would be sealed to divert surface water flows to stormwater. |

A summary overview of the proposed change in activities compared to the originally proposed Project is provided below:

**Table 2 Activities Comparison**

| Current Approved Activities | Proposed Activities |
|---|---|
| Receive SPL in Shed 5 | These activities would continue in accordance with the existing approval. Transport routes and access arrangements would remain unchanged. |
| Export treated product from Shed 6 | |
| An estimated 30 truck movements per week would be generated by the activity. | An estimated 90 additional truck movements would be generated per week by the increase to 60,000tpa. Potential traffic impacts have been considered in **Section 7**. |
| Material Preparation of SPL in Shed 5 | These activities would continue in accordance with the existing approval. The environmental controls identified in the 2009 EA would remain in place. |

| Current Approved Activities | Proposed Activities |
|---|---|
| Thermal treatment of SPL in courtyard between Shed 5 and Shed 6 | No change in the currently approved thermal treatment process. An additional 40ktpa Thermal Treatment Plant would operate replicating existing processes. The operation of an additional thermal treatment plant would result in changes in air emissions which has been considered in **Section 7**. |
| Product preparation and feeding to Grinding and Blending plant from Shed 6 | No change in activity. The environmental controls identified in the 2009 EA would remain in place. |

Construction activities would be of a similar nature, scale and duration as those originally assessed in the 2009 EA. There would not be a substantial change in the quantities of SPL materials or treated product material contained on site to achieve the proposed processing rate of 60,000tpa. A conceptual site layout is provided in Figure 2.

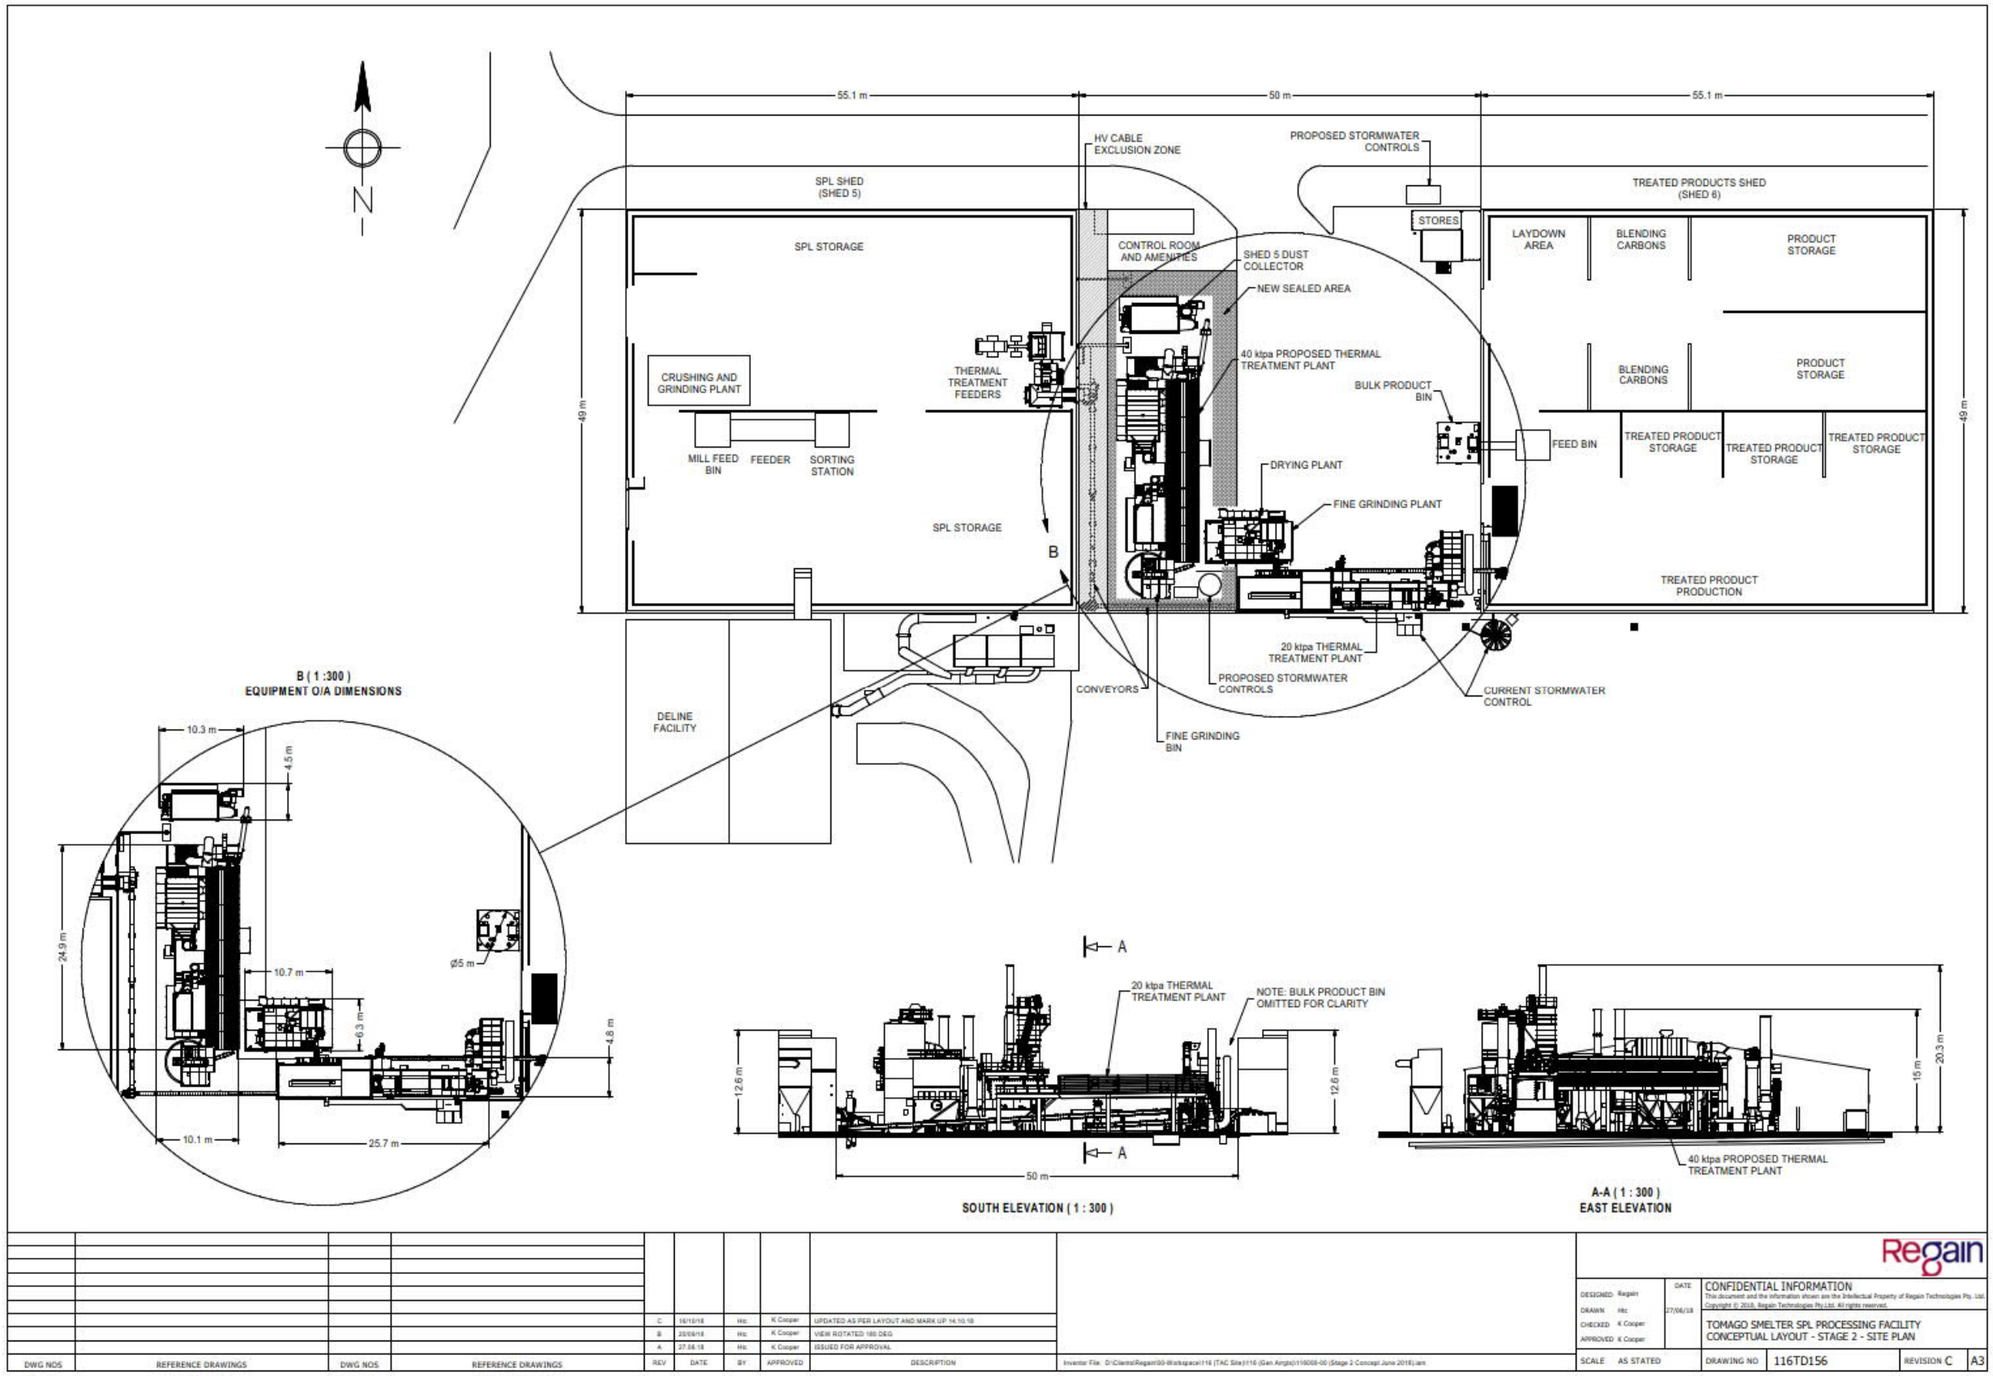

**Figure 2 Conceptual Site Layout**

## 2.2 Modified Plant Inventory

The original Project description provided in the 2009 EA described the plant required to enable the processing of SPL, including:

- 1 x Heat treatment plant;
- 1 x Blending/Product plant (incorporating drying, grinding and blending equipment); and
- Materials preparation plant including sheds, a primary crushing and coarse grinding plant.

Existing plant constructed to date operates in general accordance with the Project description provided in the 2009 EA which stated that:

- *"The heat treatment plant (which would include a rotary kiln and water reaction mixer) and product plant (where grinding and blending, drying, final product crushing and storage would be undertaken) would be located between Shed 5 and Shed 6.";* and
- *"Plant associated with the existing demonstration plant, including conveyors, crushing, grinding and sizing equipment, raw material and product bins, etc., may be retained and utilised in the proposed project."*

Opportunities have been identified to enhance the operational efficiency of the existing facility through a modified plant inventory. These modifications retain the general scale of the previously approved plant configuration. For clarity a description of each plant element required to support operation of the modified Project is provided below.

### 2.2.1 Thermal Treatment Plant

To reach the target capacity of 60,000tpa it is proposed to operate an optimised configuration utilising both thermal treatment process elements originally proposed as part of the 2009 EA and an additional thermal treatment plant.

Once commissioned the facility would operate two thermal treatment plants, one with a nominal capacity of 20,000tpa and another thermal treatment plant with a nominal capacity of 40,000tpa. Combined these thermal treatment plants would allow for the processing and subsequent recycling of up to 60,000tpa of SPL.

Each thermal treatment plant would comprise of a rotary kiln and water reaction mixer and would have independent emission points and dust filter units to filter emissions. The addition of a second thermal treatment plant would therefore require an additional emission point to that envisaged in the 2009 EA. It is anticipated that each thermal treatment plant would be approximately 15m tall (including stack heights). Therefore the scale is substantially reduced compared to the originally approved Project which considered that the new treatment plant facility would be approximately 30m above ground level.

Therefore the modification would result in a different operating configuration to that anticipated in the 2009 EA whilst retaining the general physical size and scale of the originally approved Project.

### 2.2.2 Drying Plant

Treated material would be conveyed to a rotary dryer prior to further product processing. The drying plant would form an independent plant element and its construction and operation is broadly consistent with the process described in the 2009 EA.

The 2009 EA envisaged that drying and blending of materials would be a combined process. The drying plant would operate independently but does not require an additional emission point when compared to the 2009 EA.

### 2.2.3 Fine Grinding Feed Bin

A fine grinding feed bin approximately 15m in height would allow for the interim storage and transfer of approximately 140 tonnes of treated SPL for fine grinding. The construction and operation of a product feed bin is consistent with the process described in the 2009 EA.

### 2.2.4 Fine Grinding Plant

It is proposed that a fine grinding plant would be installed with updated technology from that envisaged in the 2009 EA. The main equipment item in the fine grinding plant is a ball mill which is a rotating drum that contains a large number of steel balls. With rotation of the drum, these balls break down treated SPL material to produce a fine product. The equipment is maintained under a negative pressure by a ventilation extraction system which draws air from within the drum. This air subsequently undergoes filtration through a baghouse prior to release to atmosphere.

The proposed fine grinding plant would introduce an additional emission point for the facility when compared to the 2009 EA. The fine grinding plant would be constructed to an approximate height of 21m (including stack height).

### 2.2.5 Bulk Product Bin

A bulk product bin approximately 15m in height would be used for interim storage of products prior to shipment. The bin would have a nominal 200 tonne capacity and allow loading of trucks by enclosed conveyor. The operation of a product bin is consistent with the process described in the 2009 EA.

### 2.2.6 Shed 5 Dust Collector

A dedicated dust collection point would be employed for Shed 5 (SPL preparation areas). The construction and operation of a dedicated dust collector for this purpose is consistent with the 2009 EA.

### 2.2.7 Stormwater Controls

Additional stormwater capture, storage and reuse devices would be installed to improve existing site stormwater control and improve water use efficiencies. This would include stormwater collection points, rainwater tanks, pumps and piping to allow for the capture of stormwater and reuse in the treatment of SPL (see **Figure 3** and **Appendix L**). Some existing gravelled areas would be sealed as shown in **Figure 2**.

The hard stand at the SPL process plant and truck loading areas (in the southern section of the area between Shed 5 and Shed 6, see **Figure 3** )would be bunded to prevent potential spills of SPL or treated product being released to nearby drains and stormwater run-off channels. Stormwater captured from these areas would be reused in site processes consistent with existing operations. Stormwater would be reused in site processes in three ways:

(a) as part of a chemical reaction during the SPL treatment process;

(b) emitted as water vapour through evaporation; or

(c) contained within the products of the SPL Recycling Facility.

There would be no process water discharged from the site as a result of the Project.

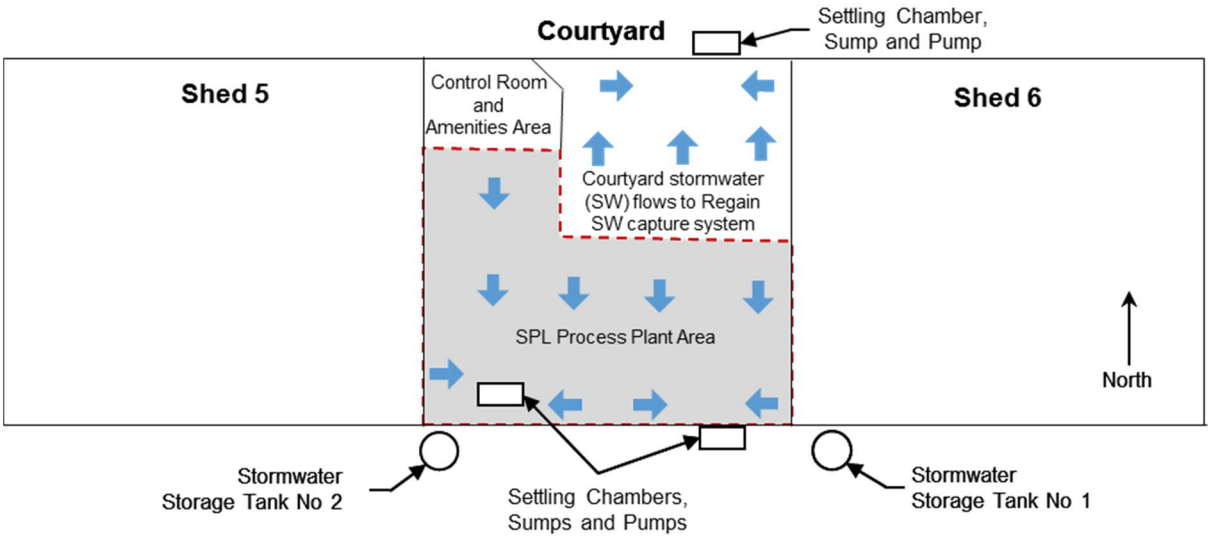

**Figure 3 Conceptual Stormwater Layout**

A first flush capture system would collect water from the north and south side of the courtyard between Shed 5 and Shed 6 (see **Figure 3**). The catchment of this area is around 2,500m$^2$ and remains unmodified. The stormwater design for this area has considered this catchment area and potential rain volumes during storm events in accordance with Port Stephens Council Stormwater Drainage Handbook. The design allows for runoff to be captured during a 1 in 1 year storm event. A services plan is provided in Appendix L.

Stormwater recovery plant consisting of collection sumps and pumps, storage tanks and pressure pumps to allow collection, storage and re-use of stormwater in the SPL Reprocessing facility. Water captured in the storage tanks would be reused in site processes consistent with existing operations. Recovered water is used as process water in the Thermal Treatment Plant.

The sumps would incorporate screens to capture debris and settling chambers to allow for periodic recovery of any sediment. Sump pumps would be activated by float switch as water levels rise, allowing for water recovery during a rainfall event. Storage tanks would include high-level switches to prevent any overflow. Each storage tank would include 2mm aperture mesh screen to collect any finer materials. Mesh screening would also act to prevent ingress of mosquitos and breeding.

In the event that the storage tank(s) reach capacity during a rainfall event, any additional stormwater is considered to have a low potential for contaminants (as potential contaminants would generally be mobilised in the initial first flush stormwater flows) and would therefore be discharged to the existing Tomago Aluminium stormwater management system.

Surface pits provide the entry points for stormwater into the Tomago stormwater (SW) system. The additional courtyard stormwater would enter surface pits located on the north and south sides of the courtyard. Rainwater from the building roof areas of Shed 5 and Shed 6 is directed to the Tomago SW system via down pipes.

SPL storage, crushing, sizing and grinding and storage would take place within covered sheds. Any water used in the SPL treatment process is contained in product. Under normal operations there is no leachate from the product.

In the unlikely event of water escaping from the product, Shed 5 and Shed 6 would utilise the internal collection drainage systems and storage tanks designed for the containment and management of any leachate.

### 2.2.8 Ancillary Components

Ancillary components would include structural supports, access gantries, electrical, gas and mechanical works required to support construction and operation of each plant element. Minor modifications would be required to plant elements on site to integrate updated plant elements.

An enclosed network of conveyors would be employed to enable the safe and efficient transfer of untreated SPL and treated SPL products between various plant elements and Shed 5 & 6.

Plant associated with existing thermal treatment of SPL, including conveyors, crushing, grinding and sizing equipment, raw material and product bins, etc., may be retained and utilised in the proposed Project.

## 2.3 SPL Treatment Process

The Project employs the same SPL treatment and handling methods as originally proposed but uses an optimised process configuration. A summary of the configuration is presented in **Figure 4** and key stages in the treatment process are presented in **Figure 5**. The SPL treatment process is discussed in further detail below and additional information is provided in **Appendix G.**

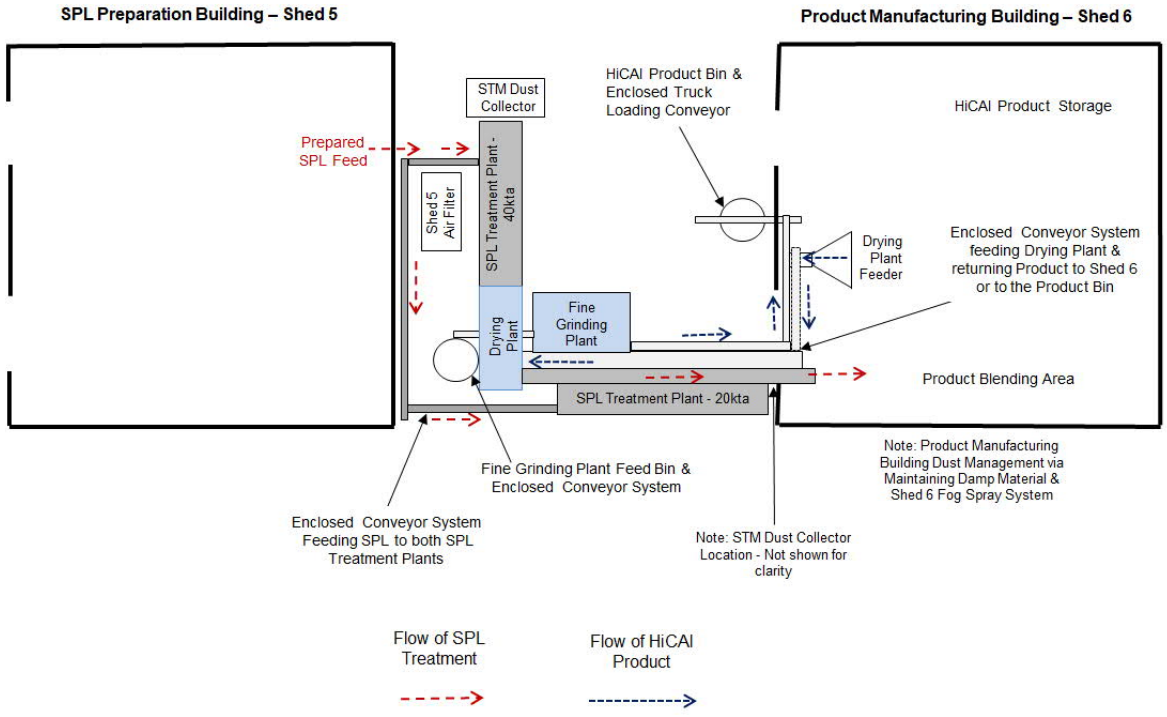

**Figure 4 Conceptual Material Flow Diagram**

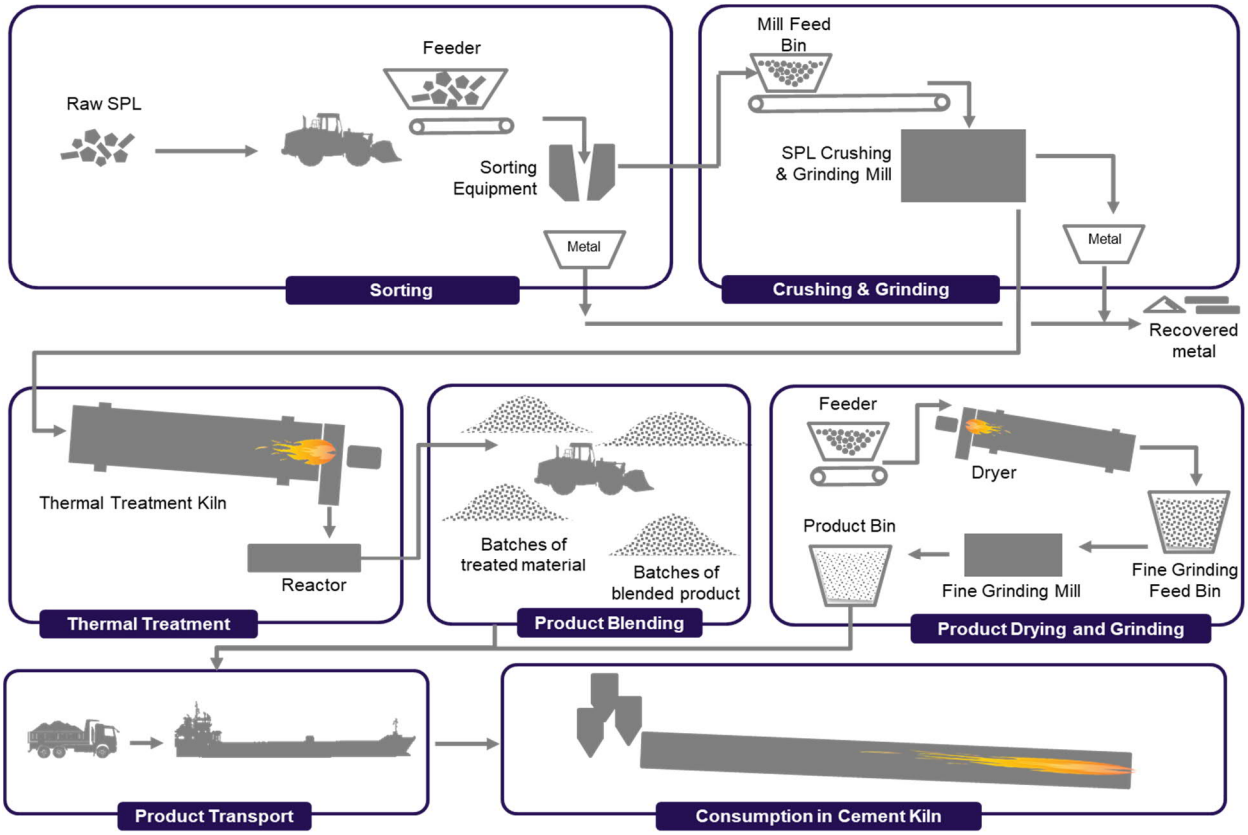

**Figure 5 Material Process Stages and Equipment**

### 2.3.1 SPL Materials Preparation

As currently occurs, pots would be taken to the existing smelter Deline facility, where the SPL is removed from the pots. The SPL material would then be transferred to Shed 5 by conveyor and retained within the Shed prior to and during preparation.

SPL material would continue to be imported from offsite facilities. Unloading practices would remain consistent with those described in the 2009 EA with trucks entering Shed 5 to be unloaded within an enclosed environment.

Untreated SPL would continue to be contained within Shed 5. Preparation and handling practices within Shed 5 would remain generally consistent with the processes described in the 2009 EA.

Material handling in Shed 5 would generally be by front end loader and excavator. The SPL would be sorted and large lumps would be broken up. The SPL would then be fed into the SPL crushing system. The crushed SPL would be transferred to stockpiles in Shed 5.

### 2.3.2 Thermal Treatment of SPL

Prepared material would be recovered from stockpiles in Shed 5 and fed via enclosed conveyor to either the 20ktpa or 40ktpa rotary kiln and treated through a process of high temperature thermal oxidation. Temperatures would be maintained below 850$^{o}$C to prevent the liberation of fluoride from the SPL. Air would be drawn into the kilns via an induction fan to facilitate combustion. Combustion products would pass to the baghouse prior to discharge to atmosphere, with collected particulate matter fed back into the product manufacturing plant.

Heated SPL would then be transferred to the water reaction mixer where it would emit flammable gases (primarily ammonia, hydrogen, methane and acetylene). The gases produced would be returned to the kiln as fuel and thermally destroyed. The processed SPL would then be free of the hazardous compounds, cyanide and flammable gases, and no longer classified as a waste material.

The thermal treatment process would allow for processing of both carbon (first-cut) and refractory (second-cut) SPL.

The thermal treatment plants are designed to operate with 80% uptime at a maximum throughput rate of 9 tonnes per hour. Maximum daily throughput would be 216 tonnes based on 100% uptime through the day. Maximum weekly throughput would be 1,500 tonnes based on 100% uptime for the week. Maximum annual throughput of waste material would be 60,000 tonnes. There are no solid or liquid residues from the process. Up to 500 tonnes of aluminium metal and steel would be recovered from the 60,000 tonnes of waste material. The metals are traded through the secondary metals industry.

### 2.3.3 Product Preparation

Products would be stored in Shed 6 or the product bin depending on product specification. Where required product preparation would occur in the proposed drying plant and fine grinding plant to achieve the characteristics required to meet product specifications.

Material would be conveyed to a rotary dryer via enclosed conveyors. The dried product would then be transferred to a product feed bin using a bucket elevator, and finally to the fine grinding plant where it would be milled to produce homogenous sizing. Following milling, the product would be passed to the product bin via an enclosed conveyor.

Products not processed through drying plant and fine grinding plant would be dispatched in the coarse grade and loaded into bulk road trucks.

### 2.3.4 Transfer of Product Material to Road Transport

The quantity of treated SPL produced at the site would determine the number of transport vehicles required to deliver the treated SPL to markets. It is conservatively estimated that the proposed Project (as modified) would result in some 90 additional truck movements per week to transport materials to and from the site. These estimates consider variability in truck size and existing batching practices. Total truck movements for the facility are conservatively estimated to increase to 120 truck movements per week based on an expected increase in production to 60,000 tpa.

Trucks accessing the SPL facility would enter the site from the smelter's heavy vehicle entrance on Old Punt Road. Loading would occur externally within the bunded hard stand area adjacent to Shed 5 and Shed 6. There are adequate turning circles and access points for the trucks to service this area.

Trucks would be loaded (externally) between Shed 5 & 6 with bulk product material by enclosed conveyor or front end loader. Fugitive dust would be managed by maintaining the moisture content of the product. Appropriate environmental controls would be employed to ensure that the potential for dust generation is minimised. Trucks would be fitted with covers before leaving the loading area.

## 2.4 Environmental Controls

The site operates in accordance with the existing Regain Management System which is an integrated management system that covers all aspects of current operations with a focus on:

- Health and Safety;
- Environmental management;
- Quality; and
- Risk management.

Reference standards for the Regain Management System are:

- The International health and safety system standard OHSAS 18001;
- AS/NZ 4801 Occupational Health & Safety Management Systems;
- ISO 14001 Environmental Standards; and
- ISO 9000 Quality Standards.

This integrated management system provides a system of communication and control built on International Standards Organisation (ISO) quality principles and incorporates a process of continuous improvement.

The following environmental controls would remain in place for the Project:

- SPL Handling and Preparation – SPL materials preparation activities would be undertaken within Shed 5 which is fitted with roller shutter doors and dedicated dust extraction.
- Enclosed External Plant – External plant would be enclosed such that there would be no open material transfer points. Plant would be maintained under slightly negative atmospheric pressure to prevent the escape of fugitive dust.
- Dust Extraction – The process circuit and key plant elements would use dust extraction to prevent the escape of fugitive dust. Each dust extractor would be fitted with a filter bag unit to remove the dust from the extracted air streams. Collected particulate matter would be returned to the production cycle.
- Alarms & Shut Down - The building dust extraction system, including filter bags, would be fitted with a visual and audible alarm system that would sound within the plant buildings to immediately shut down plant operations in the event that the dust extraction failed.
- Baghouse Temperature Monitoring – Alarm systems would be triggered by temperature probes installed in baghouses servicing the 20ktpa and 40ktpa thermal treatment plants that would alarm and shut down the plant if the inlet temperature to the baghouses exceeded 130$^{o}$C.
- Bunded Materials Transfer Areas - Areas where trucks are to be loaded or unloaded would be bunded to prevent potential SPL or product spills being released to nearby drains and stormwater run-off channels.
- Stormwater Controls - Originally proposed stormwater controls would be improved through the additional first flush systems. Consequently rain falling within the bunded courtyard areas would be directed to dedicated first flush settling chambers and sumps maintained on the Regain site. Rain falling outside the bunded courtyard area would be directed to the existing Tomago Aluminium site first flush pond. This pond allows stormwater to be collected and assessed prior to release off-site.
- Rotary Kiln Temperature Control and Safety Design - The key process control for the rotary kilns would be temperature control via the burner management system. The product temperature in the kilns would be monitored in real time. Burner management controls would maintain the required temperature. Independent High/Low temperature monitoring and alarms would be installed on the system. The rotary kiln would also be fitted with blast panels to ensure that, in the unlikely event of explosion, damage to the kiln shell would be minimised.
- Burner Management - The plant would be fitted with burners including control valves and flame detectors. In the event of a “flame-out”, the flame detector would activate and the gas control valve would close.
- Product Handling – Product stored in Shed 6 would be maintained in a moist state using fine water sprays periodically to minimise the potential for dust generation.

Dust collectors would be sized to effectively capture fugitive emissions. Indicative specifications for the pollution control equipment proposed is provided in **Table 3**.

**Table 3 Dust Collectors – Indicative Capacity and Technical Information**

| Description | Process Rate $m^3$ per hour | Temperature Sensor | Particulate Sensor | Polyester Filter Bags |
|---|---|---|---|---|
| Shed 5 Dust Collector | 47,000 | NA | Standard particulate sensor is Goyen EMP7 – 3200 Particulate Emission Monitor or equivalent. | Oleophobic Treated |
| 20ktpa Thermal Treatment Plant Dust Collector | 35,850 | Temperature Controls Pty Ltd<br>Type K Thermocouple | | Standard |
| 40ktpa Thermal Treatment Plant Dust Collector | 50,000 | Manufacturer to be determined. | | Standard |
| Drying Plant Dust Collector | 50,000 | | | Standard |
| Fine Grinding Plant Dust Collector | 15,000 | NA | | Oleophobic Treated |

### 2.4.1 Site Experience and Improvements

Two significant improvements and learnings from current operations that would be applied are as follows:

1. Progressive improvement of crushing technology for SPL preparation in Shed 5 has seen migration from more traditional industrial crushing and grinding equipment to more innovative equipment with automated electronic controls which:
   - Further reduces any potential for operator exposure to SPL with personnel operating the crushing and grinding stages from within an air-filtered cabin via automated control interfaces.
   - Reduces the variety of crushing, grinding and materials handling equipment required in Shed 5 with fewer points of potential dust emission.
2. Collaboration with the cement industry has established that significant environmental and economic gains can be achieved from the sodium fluoride compounds available from SPL within a rationalised product inventory. This has eliminated the need for a blending plant, thereby substantially reducing the volume of blended material required as part of the product preparation process currently proposed.

The existing Regain Management System incorporates a process of continuous improvement and is regularly reviewed and updated when necessary based on the outcomes of routine plant inspections, process reviews and site audits.

## 2.5 Modification of Emission Points

An overview of the revised Project configuration is provided in **Table 4**.

**Table 4 Overview of Revised Project Configuration**

| Project Configuration (2009 EA) | Revised Project Configuration (current Project) |
|---|---|
| Stack 1 - Thermal treatment plant dust collector (EPL Point 1) | Stack 1 – Thermal treatment plant dust collector (EPL Point 1) |
| | Stack 2 - Additional thermal treatment plant dust collector (New EPL Point) |
| Stack 2 Drying and blending plant dust collector (EPL Point 2) | Stack 3 – Drying plant (EPL Point 2) |
| | Stack 4 – Fine Grinding Stack (New EPL Point) |
| Stack 3 - Shed 5 air filter (EPL Point 3) | Stack 5 - Shed 5 air filter (EPL Point 3) |

The potential environmental impacts associated with the introduction of additional emission points have been assessed and are discussed in **Section 7.0** of this EA.

The Project would require a variation to EPL 13269 to provide for the addition of two emission points.

## 2.6 Modified Plant layout

The proposed site layout differs from that shown in the original site layout plan as presented in the 2009 EA (Figure 7 Proposed Facilities – SPL Treatment). The proposed layout has been adopted to recognise product handling efficiencies.

Condition 2 of Project Approval 06_0050 requires that the Proponent carries out the Project in general accordance with the site plan. A modified site plan for the Project (as modified) is shown in Figure 2 and Appendix L**.**

The Project would require a variation to EPL 13269 to provide for a revised site layout.

## 2.7 Modified Product Inventory

Regain currently manufacture four "HiCAl" products in the SPL Treatment process. HiCAl products are designed for use as fluxes[1] and mineralisers[2] in cement manufacture. Benefits include higher alite (or $C_3S$) levels in cement clinker along with economic and environmental gain from reduced energy requirements and reduced greenhouse gas emission.

Features and Benefits of HiCAl Products are the products are rich in fluorine, sodium, carbon and alumina. Under suitable process conditions, fluoride added to the cement making process accelerates the rate of alite formation and causes more alite to form in the cement clinker at a lower temperature. The product name for HiCAl is a made up word which means "higher clinker alite". The carbon in HiCAl provides heat energy when put into the cement clinker process. Sodium may add to the quality of the clinker and strength of cement when raw materials are deficient in sodium and, also, positively affecting the sulphur/alkali ratio when burning high sulphur fuels.

The current HiCAl products are as follows:

- HiCAl 30 Mineralising Carbon;
- HiCAl 40 Mineralising Carbon;
- HiCAl-R Clinker Mineraliser; and
- HiCAl-S Clinker Mineraliser.

HiCAl products are not classified as Dangerous Goods. Safety Data Sheets (SDS) and a HiCAl Products Portfolio Technical Document have been prepared and are included as **Appendix G**

The product inventory would be updated as new products are established and as market needs develop. These products would be subject to the same rigorous processes of specification, quality control and hazard management in accordance with relevant regulation as the HiCAl products are currently.

## 2.8 Site Access

Site access would remain as described in the 2009 EA with heavy vehicles accessing the site via the north gate entrance from Old Punt Road and passenger or employee vehicles accessing the Tomago Aluminium car park from Tomago Road.

[1] A flux is a substance that lowers the temperature at which solid materials enter a liquid phase and/or increases the quantity of liquid at a given temperature.
[2] A mineraliser is a substance that accelerates reaction rates promotes the formation of desired materials in the liquid phase of cement clinker or similar materials. This results in a higher quality product with less residence time and less energy for processes such as cement making.

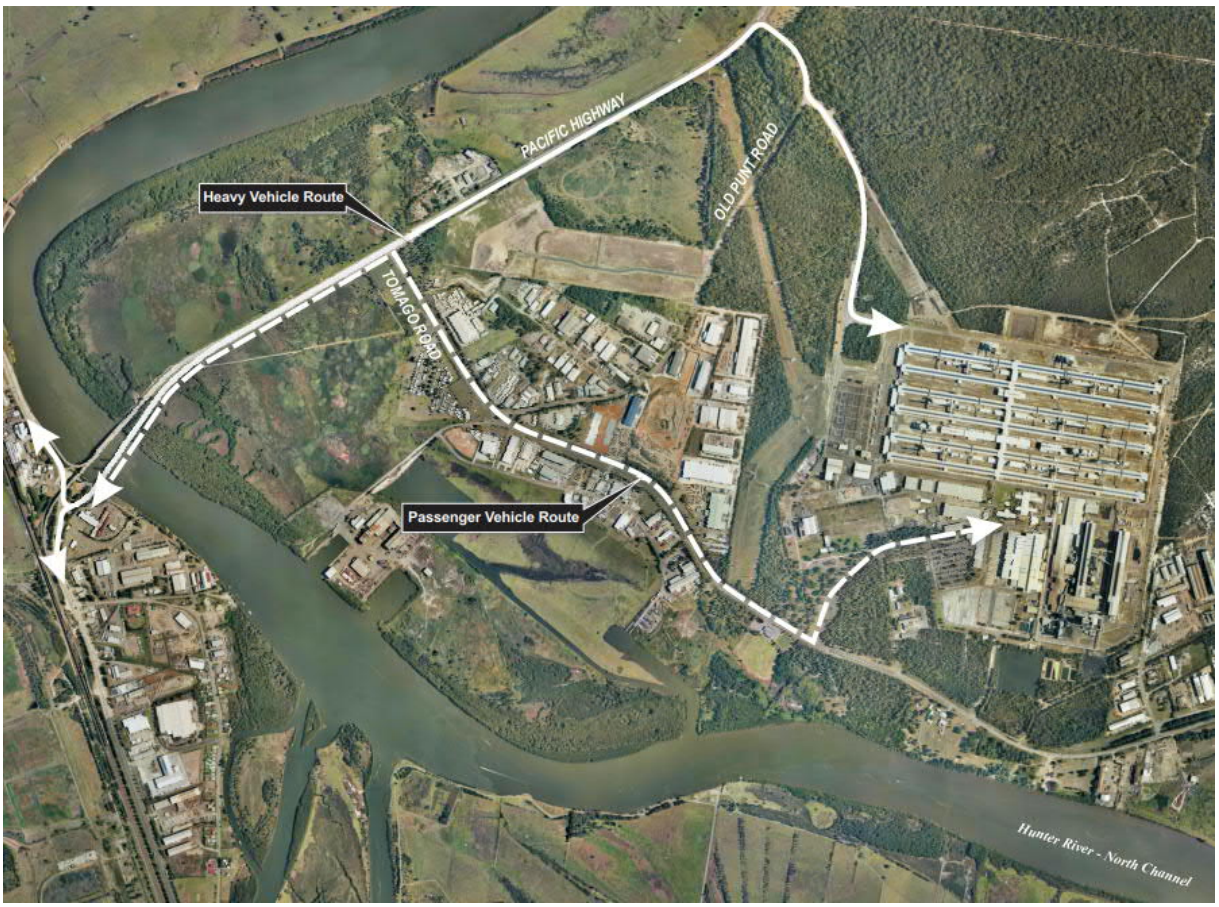

**Figure 6 Proposed Traffic Route**

## 2.9 Hours of Operation

Under the existing development consent, the facility is approved for operations 24 hours per day 7 days a week. No change to the existing operating hours or truck movement times is required for the Project.

## 2.10 Workforce

The current workforce at the Facility is composed of approximately eight personnel. This existing workforce is not expected to change for the operation of the modified Project.

## 2.11 Project Staging

### Construction

It is anticipated that construction would commence following approval of the Project (as modified) and be undertaken on a campaign basis to allow for individual plant elements to be integrated with existing operations whilst minimising disruption. Where applicable, environmental risks associated with a campaign construction approach have been considered within **Section 7.0**.

The construction stages are identified as follows:

- Stage 1 – Construction, commissioning and integration of thermal treatment plant elements, stormwater controls and ancillary components required to facilitate an increase in production to 60,000 tpa.
- Stage 2 – Bulk product plant handling elements including the drying plant, fine grinding feed bin, fine grinding plant and bulk product bin.

Each stage would have an estimated construction period of eight to ten months in total duration.

**Operations**

During operation, it is likely that production levels would 'ramp up' in stages. Production would increase incrementally over a period of time dependent on the needs of the Aluminium Smelters and market requirements. The level of production would be largely influenced by external circumstances relating to market demand.

## 2.12 Construction of the Project

Construction activities would be generally similar to those described in the 2009 EA. Construction would be undertaken during daylight hours only.

The majority of the fabrication, assembly and pre-commissioning of the plant would occur off-site. On site works would include:

- Site establishment;
- Minor excavation and earthworks for construction of concrete slabs and foundations;
- Delivery of plant modules to site and installation using mobile cranes, elevated work platforms and other construction equipment such as welding machines, grinders and oxy cutters; and
- Installation of bulk storage bins.

During the construction of the proposed Project, twelve over-dimension and 35 standard semi-trailer deliveries are anticipated to access the site during the eight to ten month construction period.

## 2.13 Interaction with Existing Operations

The Facility would continue to recycle SPL into non-hazardous waste or useable products, consistent with Project Approval 06_0050, and the process to treat SPL would be generally consistent with the process outlined in the 2009 EA. The grinding and blending process outlined in the 2009 EA would be amended for the operation of the proposed fine grinding plant.

The fine grinding plant would be associated with an additional emissions point and additional stack for the Project. The potential environmental impacts of the Project have been assessed in **Section 7.0**. This includes the cumulative impacts of the Project and its interaction with existing operations, approved and proposed operations in the vicinity of the site.

## 2.14 Modification of Conditions

Project Approval 06_0050 was granted on 7 August 2009. A copy of the existing Project Approval 06_0050 (as modified) is attached at **Appendix B**.

Modification of Project Approval 06_0050 would be required to enable increased production at the Facility as described below and **Table 5**. Where proposed amendments are shown deletions are indicated by ~~strikethrough~~ and additions in **bold**.

The definitions (page 1) would be required to be modified to include the title of this environmental assessment (*Environmental Assessment – Capacity Increase at Spent Potliner Facility, Tomago NSW,* dated 31/08/2018, and prepared by AECOM).

Condition 2 of Project Approval 06_0050 requires that the Proponent carries out the Project in general accordance with the site plan. A modified site plan for the current project is shown in Figure 2 and would need to be included as Appendix A to Project Approval 06_0050.

**Table 5 Proposed Modification of Conditions**

| Reference | Proposed Modification |
|---|---|
| The definition of Site as defined by Schedule 1 Land | ~~Lots 15 and 16 in DP 258020, Tomago Road, Tomago~~<br>**Lot 3 in DP 808004, Tomago Road, Tomago**[1] |
| Definitions | Environmental Assessment titled "Construction and Operation of a Spent Potliner Processing Facility, Tomago", dated 1 May 2009 and prepared by ENSR Australia Pty Ltd **and 'Environmental Assessment Capacity Increase at Spent Potliner Facility, Tomago NSW, dated 31/08/2018, and prepared by AECOM.** |
| Condition 2, Schedule 2 | The Proponent shall carry out the project generally in accordance with the:<br>a. EA;<br>b. **The modified** site plan in **Appendix A**;<br>c. Statement of commitments; and<br>d. Conditions of this approval |
| Condition 5, Schedule 2 | The Proponent shall not process more than a total of ~~20,000~~ **60,000** tonnes per annum (tpa) of SPL waste classified as hazardous or restricted solid waste. |
| Condition 19, Schedule 3 | Within nine months of the commencement of operations, the Proponent shall prepare and submit an Air Quality Verification Report to the satisfaction of the Director-General and the ~~DECC~~**EPA**. The Air Quality Verification Report shall include:<br>i. Monitoring data required by the EPL;<br>ii. Copies of all analytical test reports for all substances sampled and tested;<br>iii. Comparison of monitoring results with the predictions outlined in the EA and with any limits or conditions in the EPL; and<br>iv. If necessary, additional measures that would be implemented to comply with the requirements of the EPL. |

[1] As a result of a previous sub-division the title details of the site have changed.

# 3.0 Need for the Project

## 3.1 Continued Reuse Services

Processing of SPL not only fully recycles a waste product by removing it from the waste stream, but also generates end-products that provide energy savings and reduces the consumption of primary fuel in the brick and cement industries.

SPL wastes from aluminium smelters have historically been stockpiled on site at smelters and/or exported overseas for treatment. While storage of SPL wastes in suitable onsite sheds is acceptable in the short term, long term stockpiling of this hazardous waste is not considered appropriate where it poses ongoing potential risks.

A report prepared by Randell Environmental Consulting (REC) on behalf of the Commonwealth Department of the Environment and Energy (DoEE) investigated the feasibility of an agreement-based approach to clearing stockpiles of SPL (REC, 2016). The report noted that a significant SPL stockpile had accumulated in Australia with a total of around 700,000 tonnes of SPL in storages around Australia. Furthermore, REC (2016) estimated that Australia is currently generating about 36,000 tonnes of SPL per annum.

The Project would provide for an increase in processing capacity at the existing Facility to 60,000tpa. This provides the opportunity to assist in the processing of SPL wastes currently being stockpiled throughout Australia, thereby decreasing the time taken to draw down these significant stockpiles.

## 3.2 Operational Efficiency

The Facility cannot be operated at its optimal capacity with the existing production limit of 20,000tpa. Operating the Facility at a sub-optimal capacity results in increased energy requirements and operational costs associated with plant shut-down and start-up processes. An increased production limit is required at the Facility to reduce the frequency of plant shut-down and start-up processes and realise the benefits of reduced energy requirements and operational costs.

Opportunities to increase the operational efficiency of the Facility have also been identified for the amendment of the existing site layout and for modifications to existing key plant components associated with the development of new blending/product plant technology. The updated technology would result in improved operational performance when compared to the facility proposed in the 2009 EA.

## 3.3 Alternatives Considered

The ‘do nothing’ option would involve operating the facility in accordance with the existing Project Approval 06_0050. This would mean that identified operational efficiencies would not be achieved, and Regain may be unable to meet market demand or assist in the drawdown of Australia’s significant SPL stockpiles due to current operational production limits. Without a sustainable recycling solution SPL would continue to be stockpiled and/or transported overseas for processing.

Alternative options to increasing the processing capacity of SPL at the Regain site would include construction of a new facility at a different location. However the existing Facility is already established and experienced with processing SPL wastes and is located within the Tomago Aluminium smelter site improving material handling efficiencies. The potential environmental impacts associated with construction of a new facility at a different location makes this option less favourable in comparison to the current Project.

This page has been left blank intentionally.

# 4.0 Statutory Planning

## 4.1 Overview

This section identifies the legislative requirements and planning controls relevant to the Project and outlines the key policy and statutory considerations that would be addressed in more detail in the Environmental Assessment.

## 4.2 Commonwealth Matters

### 4.2.1 Environment Protection and Biodiversity Conservation Act 1999

Actions that may significantly affect matters of national environmental significance (NES) require assessment and /or approval from the Commonwealth Department of Environment and Energy under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act). The EPBC Act lists nine matters of NES that must be addressed when assessing the environmental impacts of a proposal.

A Protected Matters Search of NES Matters within a 10km radius of the Facility was undertaken on 22 June 2018 to determine what NES features may be present in the vicinity. The results of the search are provided at **Appendix C** and summarised in **Table 6**.

**Table 6 Consideration of Matters of National Environmental Significance under the EPBC Act**

| NES Matters | Comment |
|---|---|
| Australia's World Heritage properties | There are no World Heritage properties within 10 km of the Facility. |
| National Heritage Places | There are no National Heritage places within 10 km of the Facility. |
| Ramsar wetlands of international importance | There is one Ramsar wetland of international importance within 10 km of the Facility. The Hunter Estuary Wetlands Ramsar site is comprised of two components: Kooragang (which covers 2,926 ha) and Hunter Wetlands Centre Australia (which covers 42 ha). The Kooragang component is located in the estuary of the Hunter River, approximately 1.5 km southwest of the Facility. The Hunter Wetlands Centre Australia component is located 2.5 km from Kooragang (more than 5 km south of the Facility). An assessment of potential impacts on ecology associated with air emissions generated by the Project is provided in **Section 7.8**. The Project is unlikely to impact on this wetland system. |
| Nationally threatened species and ecological communities | There are four listed threatened ecological communities and 68 listed threatened species that may occur within 10 km of the Facility. An assessment of potential impacts on ecology associated with air emissions generated by the Project is provided in **Section 7.8**. The Project would be contained wholly within the existing industrial site for the Facility and is unlikely to impact on Commonwealth-listed threatened species or ecological communities. |
| Migratory species listed under the EPBC Act | There are 62 listed migratory species within 10 km of the Facility. An assessment of potential impacts on ecology associated with air emissions generated by the Project is provided in **Section 7.8**. The Project would be contained wholly within the existing industrial site for the Facility and is unlikely to impact on Commonwealth-listed migratory species or species protected under international agreements. |
| Commonwealth Marine areas | There are no Commonwealth Marine Areas within 10 km of the Facility. |
| Great Barrier Reef Marine Park | The Great Barrier Reef Marine Park is not located within 10 km of the Facility. |

| NES Matters | Comment |
|---|---|
| Nuclear actions, including uranium mining | The Project would not involve a nuclear action. |
| Water resources impacted on by a coal seam gas or large coal mining development | The Project would not involve coal seam gas or coal mining. |

The proposed Project would not have a significant impact on matters of NES. Accordingly, a referral to the Commonwealth Department of Environment and Energy under the EPBC Act is not required.

## 4.3 State Matters

### 4.3.1 Environmental Planning and Assessment Act 1979 (EP&A Act)

Development in NSW is regulated by the EP&A Act. Environmental Planning Instruments are enacted under the EP&A Act, including State Environmental Planning Policies (SEPPs), which determine the permissibility of a Project and the environmental assessment pathway for the project.

The Facility currently operates under Project Approval 06_0050, issued under Part 3A of the EP&A Act. While Part 3A of the EP&A Act was repealed in 2011, transitional arrangements were set out in Schedule 6A of the EP&A Act which provided that Part 3A continued to apply to approved Part 3A projects, including modifications to Project Approvals under section 75W of the EP&A Act.

On 1 March 2018, amendments to the EP&A Act were enacted to remove these Part 3A transitional arrangements. The transitional arrangements that were previously contained within Schedule 6A of the EP&A Act were transferred to Schedule 2 of the *Environmental Planning and Assessment (Savings, Transitional and Other Provisions) Regulation 2017,* with additional provisions inserted regarding the removal of these transitional Part 3A arrangements including:

> **3BA Winding-up of transitional Part 3A modification provisions on cut-off date of 1 March 2018 and other provisions relating to modifications**
>
> 1. For the purposes of this clause, the *cut-off date* is 1 March 2018.
> 2. An approved project or a concept plan cannot be modified under section 75W on or after the cut-off date, except as provided by this clause.
> 3. Subclause (2) does not apply if the request to modify the approved project or concept plan under section 75W was lodged before the cut-off date. Accordingly, the provisions of this Schedule relating to a modification made pursuant to such a request continue to apply.
> 4. A request to modify an approved project or concept plan under section 75W that may be dealt with because of subclause (3) cannot be dealt with under section 75W if:
>
>  a. the request has not been determined by 1 September 2018, and
>
>  b. the Secretary is of the opinion that insufficient information has been provided to deal with the request and notifies the person who made the request that it will not be dealt with under section 75W.

Regain submitted a request to modify Project Approval 06_0050 on 18 August 2017 and the DP&E provided EARs for the modification on 20 December 2017. As this modification request was submitted prior to the cut-off date of 1 March 2018, the provisions of the former Part 3A continue to apply to this modification request.

The proposed Facility upgrade would therefore be undertaken as a modification to the existing approval (06_0050) under section 75W of Part 3A (repealed) of the EP&A Act. The approval authority is the Minister for Planning.

### 4.3.2 State Environmental Planning Policies

**State Environmental Planning Policy (Coastal Management) 2018 (Coastal Management SEPP)**

The Coastal Management SEPP promotes an integrated and co-ordinated approach to land use planning in the coastal zone. This policy applies to land within the coastal zone, including land identified as 'coastal wetlands' and 'proximity area for coastal wetlands' on the *Coastal Wetlands and Littoral Rainforests Area Map* and land identified as 'coastal environment area' on the *Coastal Environment Area Map*.

There are a number of coastal wetlands located in the vicinity of the Facility (approximately 700m south, 1.5km west and 4km east). The Facility is not located within the 'proximity area for coastal wetlands' associated with these coastal wetlands, and is not located within the coastal environment area as defined by the Coastal Management SEPP (approximately 200m south of the Facility).

Clause 10 (1) of the Coastal Management SEPP restricts activities that involve clearing of native vegetation, harming of marine vegetation, the carrying out of earthworks, construction of a levee, draining of land or environmental protection works, or any other development on land identified as 'coastal wetlands', except with development consent.

No construction activities would be undertaken within coastal wetlands or the coastal environment area. Given the distances of these coastal features from the Facility, the Project is not expected to have adverse indirect impacts on these areas and the provisions of the Coastal Management SEPP are not applicable.

**State Environmental Planning Policy 33 – Hazardous and Offensive Development (SEPP 33)**

SEPP 33 aims to ensure that the consent authority has sufficient information regarding a proposal to determine whether the development meets the criteria for hazardous or offensive development. Conditions to minimise or reduce adverse effects can then be imposed within the consent issued. SEPP 33 requires applications for potentially hazardous or offensive industry to be accompanied by a preliminary hazard screening.

A Preliminary Hazard Analysis (PHA) of the SPL Facility was previously undertaken (SKM, 2007) to assess the potential risks associated with the Facility. The PHA (SKM, 2007) concluded that, with the implementation of proposed safeguards, the risk of incidents with offsite impact is low.

A preliminary screening analysis was undertaken for the proposed modification, including a gap analysis against the existing PHA (SKM, 2007). These analyses concluded that the proposed modification to increase processing capacity would not result in a change to the existing risk profile of the SPL Facility (refer **Section 7.2**).

**State Environmental Planning Policy 44 – Koala Habitat Protection (SEPP 44)**

SEPP 44 aims to encourage the conservation and management of areas of natural vegetation that provide a habitat for koalas. SEPP 44 requires a plan of management for areas of more than one hectare that contain koala habitat for which a development application has been made to council. Although development consent from Council is not required for this proposed modification, the intent of this SEPP has been considered.

Port Stephens LGA is listed in Schedule 1 of SEPP 44, and Port Stephens Council has prepared a Comprehensive Koala Plan of Management which provides broad scale mapping koala habitat within the Port Stephens LGA. The mapping is designed as a trigger for further investigation through the development assessment process. The plan of management includes performance criteria and development standards to guide the assessment process for projects on land that contains preferred or supplementary koala habitat.

The Facility is located on an existing industrial site, which does not contain potential or core koala habitat. Land adjacent to the Project site, within the wider Tomago Aluminium smelter site, is mapped as containing Supplementary Koala Habitat. The proposed Project is unlikely to adversely affect koala habitat and the provisions of SEPP 44 are therefore not applicable. However potential impacts on ecological values due to gaseous fluoride emissions are considered in **Section 7.1**.

**State Environmental Planning Policy 55 – Remediation of Land (SEPP 55)**

SEPP 55 provides a state-wide planning control for the remediation of contaminated land to reduce the risk of harm to human health or other environmental systems. Clause 7 of SEPP 55 requires consideration of whether the land is contaminated and whether it is suitable (or can be made suitable) for proposed development. The Facility is not located on or adjacent to known contaminated lands.

The proposed modification would be located within or adjacent to existing buildings on the site. There is only minimal soil disturbance proposed for the installation of the fine grinding plant. The site is understood to be in a suitable condition for the proposed Project.

### 4.3.3 Protection of the Environment Operations Act 1979 (POEO Act)

The POEO Act provides a regulatory framework for the protection of the environment, and defines activities of a type and scale that are considered to be 'scheduled activities' and which require an Environmental Protection Licence (EPL).

The SPL Facility operates under EPL 13269, issued by the EPA under the POEO Act. The EPL covers the activities of resource recovery and waste storage. The EPL sets out the operational requirements for the Facility, including concentration limits for discharges to air, the types of wastes that may be received at the premises, and other monitoring and reporting conditions.

### 4.3.4 Environmentally Hazardous Chemicals Act 1985 (EHC Act)

The EHC Act controls the use and handling of specific chemicals and chemical wastes. The EPA regulates chemicals of environmental concern and can issue a Chemical Control Order (CCO) to regulate particular chemicals and / or chemical wastes.

A CCO in relation to aluminium smelter wastes containing fluoride and / or cyanide (which includes SPL) was issued on 21 March 1986. The CCO regulates activities associated with these wastes. Processing, storing, transporting and disposing of SPL is prohibited under the CCO, except when conducted in accordance with a licence issued by the EPA.

The EPA issued a licence to Regain under the EHC Act (licence #88), which imposes conditions on the processing and conveying of the SPL. The EHC Licence enables SPL from the Hydro facility at Kurri Kurri to be transported to the Tomago facility for processing, and includes conditions relating to incident management, incident reporting, and annual reporting to the EPA. The EHC Licence would be reviewed following approval of the Project and if required, modified to maintain consistency.

The EPA is reviewing the environmentally hazardous chemicals legislation to modernise the EHC Act and introduce a more streamlined system for the management of hazardous chemicals. The proposed updated and simplified EHC Act would include streamlined controls and remove licensing duplication for industrial premises. The proposed amendments would provide consistency with future national reforms for harmonising regulation of industrial chemicals. If these amendments are enacted, the EHC licence would no longer be required, and the chemical conditions relating to SPL would be integrated into the EPL required under the POEO Act.

### 4.3.5 Biodiversity Conservation Act 2016

The *Biodiversity Conservation Act 2016* (BC Act) aims to conserve biodiversity at bioregional and State levels to maintain the diversity and quality of ecosystems. The BC Act provides for the protection of threatened species, populations and ecological communities, their habitats and critical habitat. Species, populations and ecological communities that are listed as critically endangered, endangered or vulnerable are identified in Schedule 1 of the BC Act. Potential impacts to ecology are considered in **Section 7.8**. The Project would not significantly impact species or communicates identified under Schedule 1 of the BC Act. No clearing of vegetation is proposed as part of the modifications.

## 4.4 Local Matters

### 4.4.1 Port Stephens Local Environmental Plan 2013

The SPL Facility is located within the IN1 General Industrial zone under the *Port Stephens Local Environmental Plan 2013* (LEP 2013). The objectives of the Zone are:

- To provide a wide range of industrial and warehouse land uses;
- To encourage employment opportunities;
- To minimise any adverse effect of industry on other land uses; and
- To support and protect industrial land for industrial uses.

As the Project is a Part 3A project, the provisions of the LEP 2011 do not apply. Nonetheless, the proposed modification is considered to be consistent with the objectives of the LEP 2013, and is consistent with the existing industrial land use currently approved on the site.

This page has been left blank intentionally.

# 5.0 Stakeholder Consultation

## 5.1 Environmental Assessment Requirements

Regain provided a Project briefing to the DP&E on 18 August 2017, with additional information provided on 28 November 2017. DP&E subsequently issued Environmental Assessment Requirements (EARs) for the proposed modification on 20 December 2017, identifying the issues to be included in the EA for this proposal. Each of the matters identified in the EARs for consideration in the EA is outlined in **Table 7**, together with the relevant section of the EA which addresses that matter.

**Table 7 Environmental Assessment Requirements (EARs)**

| Matter | EA Reference |
|---|---|
| Detailed description of the development, including:<br>• existing operations carried out on the site and how the site operates lawfully under the EP&A Act including any reliance on existing use rights and/or planning approvals and how these will be consolidated;<br>• accurate history of the site, including development consents;<br>• need for the proposed development;<br>• justification for the proposed development;<br>• likely staging of the development – including demolition, construction, and operation stage/s;<br>• likely interactions between the development and existing, approved and proposed operations in the vicinity of the site;<br>• plans of any proposed building works;<br>• contributions required to offset the proposal;<br>• identification of conditions to be modified. | **Section 2.0** |
| Consideration of all relevant environmental planning instruments, including identification and justification of any inconsistencies with these instruments. | **Section 4.0** |
| Risk assessment of the potential environment impacts of the development, identifying the key issues for further assessment. | **Section 6.0** |
| Detailed assessment of the key issues specified below, and any other significant issues identified in this risk assessment, which includes:<br>• a description of the existing environment, using sufficient baseline data;<br>• an assessment of the potential impacts of all stages of the development, including any cumulative impacts, taking into consideration relevant guidelines, policies, plans and statutes;<br>• a description of the measures that would be implemented to avoid, minimise and if necessary, offset the potential impacts of the development, including proposals for adaptive management and/or contingency plans to manage any significant risks to the environment;<br>• a consolidated summary of all the proposed environment and monitoring measures, highlighting commitments included in the EA. | **Section 7.0** |
| **Waste Management** – including:<br>• a description of the waste streams that would be accepted at the site including the maximum daily, weekly and annual throughputs;<br>• details of the source of the waste streams to justify the need for the proposed processing capacity;<br>• a description of waste processing operations, including a description of the technology to be installed, resource outputs, and the quality control measures that would be implemented;<br>• details of where SPL will be sourced from;<br>• details of how waste would be stored and handled on site, and transported to and from the site including details of how the receipt of non-conforming waste would be dealt with; | **Section 7.8** |

| Matter | EA Reference |
|---|---|
| • the measures that would be implemented to ensure that the development is consistent with the aims, objectives and guidance in the *NSW Waste Avoidance and Resource Recovery Strategy 2014 - 2021*. | |
| **Soil and Water** – including:<br>• an assessment of potential impacts to soil and water resources, topography, hydrology, drainage lines, watercourses and riparian lands on or nearby to the site;<br>• a detailed site water balance;<br>• any works with the potential to intercept the groundwater table;<br>• details of stormwater/wastewater/leachate management systems including the capacity of onsite detention systems, and measures to treat, reuse or dispose of water;<br>• characterisation of the nature and extent of any contamination on the site and a description of proposed management measures. | **Section 7.8** |
| **Air Quality and Odour** – including:<br>• a quantitative assessment of the potential air quality, dust and odour impacts of the development in accordance with relevant Environment Protection Authority guidelines;<br>• the details of buildings and air handling systems and strong justification for any material handling, processing or stockpiling external to a building;<br>• justification for the substantial difference in the 2009 and 2017 air dispersion modelling results;<br>• a greenhouse gas (GHG) assessment;<br>• details of proposed mitigation, management and monitoring measures. | **Section 7.1** |
| **Noise and Vibration** – including<br>• a quantitative assessment of potential demolition, construction, operational and transport noise and vibration impacts in accordance with relevant Environment Protection Authority guidelines;<br>• an assessment of the predicted transport noise and vibration impacts and justification of proposed transport routes and times;<br>• details and justification of the proposed noise mitigation and monitoring measures. | **Section 7.5** |
| **Traffic and Transport** – including:<br>• details of all traffic types and volumes likely to be generated during construction and operation, including a description of haul routes;<br>• an assessment of the predicted impacts of this traffic on road safety and the capacity of the road network, including consideration of cumulative traffic impacts at key intersections using SIDRA or similar traffic model;<br>• detailed plans of the proposed layout of the internal road network and parking on site in accordance with the relevant Australian Standards;<br>• plans of any proposed road upgrades, infrastructure works or new roads required for the development;<br>• turning path diagrams depicting vehicles entering, existing and manoeuvring throughout the site. | **Section 7.4** |
| **Human Health Risk** – including:<br>• an assessment of the potential human health risks (on site and off site) associated with the processing of SPL;<br>• details of mitigation and management measures to minimise human health risks and ensure the safety of workers during the development | **Section 7.3** |
| **Hazards and risks** – The environmental assessment must include a Preliminary Hazard Analysis (PHA) for the modification, prepared in accordance with Hazardous Industry Planning Advisory Paper No. 6 'Hazard Analysis' (Department of Planning, 2011) and Mufti-Level Risk Assessment (Department of Planning, 2011). | **Section 7.2** |

| Matter | EA Reference |
|---|---|
| The PHA must:<br>• identify the hazards and safeguards for the modification<br>• include a cumulative risk assessment, covering the simultaneous operation of the existing 20,000 tonnes per annum demonstration plant and the proposed 40,000 tonnes per annum combination drying and thermal treatment plant. | |
| **Sensitive Receivers** – including consideration of potential impacts, particularly noise and air quality. | **Section 7.0** |
| **Visual** – including an assessment of the potential visual impacts of the Project on the amenity of the surrounding area. | **Section 7.8** |
| **Consultation**<br>During preparation of the EA, you must consult with the relevant local, State or Commonwealth Government authorities, service providers, community groups and potentially affected landowners. In particular you must consult with:<br>• Port Stephens Council<br>• Environment Protection Authority<br>• Office and Environment and Heritage<br>• Hunter Water Corporation<br>• SafeWork NSW<br>• Hunter New England Local Health District<br>• Roads and Maritime Services<br>• Fire and Rescue NSW<br>• nearby land owners and occupiers that may be affected by the proposal.<br>The EA must describe the consultation process and the issues raised, and identify where the design of the development has been amended in response to these issues. Where amendments have not been made to address an issue, a short explanation should be provided. | **Section 5.2** |

## 5.2 Government Agencies and Landholders

The following government agencies and potentially affected land owners were contacted during the assessment process:

- Port Stephens Council;
- Environment Protection Authority;
- Office and Environment and Heritage;
- Hunter Water Corporation;
- SafeWork NSW;
- Hunter New England Local Health District;
- Roads and Maritime Services;
- Fire and Rescue NSW; and
- Tomago Aluminium Company.

The agencies were initially contacted by letter correspondence summarising the Project and potential impacts. In addition to the EARs issued for the Project, clarifications were sought from key stakeholders, as relevant, on issues raised in the EARs and the scope of assessment these stakeholders expected in the EA. A summary of Project specific issues raised by these stakeholders during consultation and how those matters have been addressed in the EA are listed in **Table 8**.

This page has been left blank intentionally.

**Table 8 Stakeholder Consultation**

| Stakeholder Contacted | Summary of Issues Raised by Stakeholders | Proponent Response |
|---|---|---|
| Port Stephens Council | Port Stephens Council made the following comments regarding the Project:<br>• The Traffic Impact Assessment and Stormwater Management plans shall be updated in support of the modification (particularly with regard to water quality controls on site);<br>• Indirect impacts on the ecological values of the site through the construction and operation phases should be considered, including (but not limited to):<br>- Vegetation mapped as Supplementary and Marginal Habitat under the Port Stephens Comprehensive Koala Plan of Management. The subject site forms part of an area of known generation persistence for koalas and forms potential habitat and/or corridors for threatened species such as Koalas, Squirrel Glider and Wallum Froglet; and<br>- Wetlands identified in the Port Stephens Local Environmental Plan 2013 and the State Environmental Planning Policy (Coastal Management) 2018.<br>• The development shall comply with the existing (and modified) Environment Protection Licence (EPL) 13269, Environmentally Hazardous Chemicals Licence #88 and the Project Approval (06_0050), including the Secretary's Environmental Assessment Requirements (SEARs) issued for the Project.<br>Further additional consultation was undertaken to clarify feedback received to support preparation of the EA. Issues discussed included:<br>• The existing traffic environment, including the current Old Punt Road intersection configuration and historic upgrade of this intersection providing slip lanes and dedicated turning lanes;<br>• The existing stormwater controls in place for the site, including connection with Tomago Aluminium facilities and existing Environmental Management Plans;<br>• The existing buffer lands established for Tomago Aluminium to accommodate operation of the facility and associated processes; and<br>• An environmental risk review process informing the level of assessment provided for each environmental factor considering the extent of proposed modifications and associated potential consequences. | Based on additional consultation and discussions with Port Stephens Council representatives it is considered that the EA adequately addresses the issues raised.<br>The traffic section of the 2009 EA was reviewed during the preparation of this EA. The findings of the traffic assessment have been updated in this EA, where necessary using available data. These findings have been confirmed to still be relevant and applicable to the Project.<br>An assessment of the heavy vehicle haul routes to and from the Facility has been incorporated into the **Section 7.4**.<br>Traffic concerns are addressed in **Section 7.4** of this EA.<br>**Section 7.7** outlines that the Stormwater Management Plan would be reviewed and updated to accompany the modified Project.<br>Impacts to biodiversity are addressed in **Section 7.7**. The footprint of the facility would not change as part of the Project and potential impacts are limited to the existing site. Potential impacts on ecological values due to gaseous fluoride emissions are considered in **Section 7.1**.<br>In **Section 4.3.2**, the implications of the Project on the Coastal Management SEPP and SEPP 44 is discussed.<br>The proposed compliance of the Project with the POEO Act is outlined in Chapter 4.0. |

| Stakeholder Contacted | Summary of Issues Raised by Stakeholders | Proponent Response |
|---|---|---|
| Environment Protection Authority | The EPA identified three key information requirements for the Project EA to include:<br>• Air impacts- assessment of the potential impacts on air quality and demonstration that any emissions can comply with the emission standards contained within the Protection of the Environment Operations (Clean Air) Regulation 2010;<br>• Waste- clear and detailed explanation of the classification, processing, storage and management of the aluminium smelter waste; and<br>• Water management- assessment of potential impacts on surface and groundwaters; identification of appropriate pollution control measures to protect surface and groundwater; and proposed monitoring to protect surface and groundwater.<br>The EPA also indicated that the EA should address a number of specific EA requirements. These have been summarised below:<br>1. Environmental impacts of the proposal-The EA must address the requirements of Section 45 of the POEO Act.<br>2. Description of the proposal-The EA must include a Project description that is comprehensive and unambiguous.<br>3. Air quality-the EA must demonstrate compliance with POEO Act, include a new air quality impact assessment (AQIA) and outline specifications of all pollution control and management for both point and fugitive emissions.<br>4. Waste- The EA must include information on waste, material and product management and must detail quality assurance and controls.<br>5. Hazards and risk- The EA must include consideration of hazards and risks associated with the tripling in processing capacity.<br>6. Ecological risk- The EA must include consideration of potential ecological risks associated with increased loading of fluoride in the environment, and including potential impacts on fauna and flora.<br>7. Water management- The EA must include assessment of potential impact on surface and groundwaters and identification of pollution control measures and monitoring. The EA must also address any changes and potential impacts from any discharges through Tomago Aluminium's licensed facility, including Discharge Point 38. | Potential impacts to air are addressed in **Section 7.1**. An AQIA was carried out in accordance with the document, *Approved Methods for the Modelling and Assessment of Air Pollutants in NSW* (2005).<br>The waste chapter (refer **Section 7.7**) has addressed onsite handling of waste as well as waste management protocols to protect the environment. Further to this, **Appendix G** contains a resource detailing the source of materials that the facility recovers from the aluminium smelting industry as well as how the facility processes by-product materials and hazard elimination and the product manufacturing process.<br>Quality assurance practices including routine laboratory testing and potential corrective actions are discussed in **Section 7.7**.<br>In response to the specific EA requirements outlined by the EPA, those that have not been discussed above in the three key requirements have been addressed below.<br>Environmental impacts- the impacts of the modified Project have been addressed in Chapter 6 and **Section 7.7**. Emissions monitoring is discussed in Section 7.1.<br>A comprehensive and unambiguous description of the Project is provided in Chapter 2.<br>Hazards and risks associated with the increased production at the facility are discussed in **Section 7.2**. This includes appropriate handling and storage management measures of SPL.<br>Potential impacts on ecological values due to |

| Stakeholder Contacted | Summary of Issues Raised by Stakeholders | Proponent Response |
|---|---|---|
| | | gaseous fluoride emissions are considered in **Section 7.1** and **Section 7.8**.<br>Regain would consult further with the EPA as necessary to support the EPL licence variation. |
| Office and Environment and Heritage | OEH indicated that the Department had no comments or feedback to provide at this stage of the Project. | Potential impacts on ecological values due to gaseous fluoride emissions are considered in **Section 7.1**. |
| Hunter Water Corporation | Letter correspondence dated 5th September 2018 was received in response to stakeholder consultation.<br>The following issues were raised:<br>• Potential for an increase in deposition of airborne contaminants that may impact on the Tomago Sandbeds either as a result of air emissions or dust release during material handling and process operations;<br>• Consequences of unplanned failure of the heat treatment plant;<br>• Material handling practices and any potential for contamination of groundwater;<br>• Capacity of the existing stormwater system; and<br>• Water and wastewater services including water demands associated with the proposed modification.<br>A Project briefing session was held at the Hunter Water Corporation main office on 25th September 2018 to discuss the Project and feedback provided by HWC. | Based on additional consultation and discussions with HWC representatives it is considered that the EA adequately addresses the issues raised.<br>Potential impacts on the Tomago Sandbeds due to gaseous fluoride emissions and other airborne contaminants is considered in **Section 7.6**.<br>Environmental controls for the Project including automatic shutdown procedures during failure of the thermal treatment plant are described in **Section 2.4.**<br>Material handling practices are described in **Section 7.7**.<br>Stormwater and water consumption demands are described in **Section 7.6.** |
| SafeWork NSW | A representative from SafeWork NSW was contacted to discuss the details of the Project. The following issues were discussed:<br>• An environmental risk review process informing the level of assessment provided for each environmental factor considering the extent of proposed modifications and associated potential consequences;<br>• Existing safe work practices employed on site including environmental safeguards and controls; and | An environmental risk review is provided in **Section 6**<br>Material handling practices and health assessments are discussed in **Section 7.7**.<br>Hazard and Risk Management Standards are included in **Appendix J**. |

| Stakeholder Contacted | Summary of Issues Raised by Stakeholders | Proponent Response |
|---|---|---|
| | • Regular health assessments of workers, undertaken as part of continued health monitoring activities across Regain operations.<br><br>It was requested that the Environmental Assessment present information on workplace practices for SPL processing. No further issues were raised in response to consultation. | |
| Hunter New England Local Health District | A representative from Hunter New England Local Health District was contacted to discuss the details of the Project. The following issues were discussed:<br><br>• The conservative approach adopted for the Air Quality Impact Assessment and Human Health Risk Assessment with consideration of potential cumulative impacts.<br>• Consideration of mitigation measures as may apply to construction or operation to ensure separation of potable and process water and adequate mosquito management.<br>• The existing stormwater controls in place for the site, including connection with Tomago Aluminium facilities and existing Environmental Management Plans.<br>• The existing buffer lands established for Tomago Aluminium and capacity to accommodate operation of the facility and associated processes.<br>• An environmental risk review process informing the level of assessment provided for each environmental factor considering the extent of proposed modifications and associated potential consequences.<br><br>No further issues were raised in response to consultation. | Potential impacts to air (including consideration of vegetation within the buffer lands) are described in **Section 7.1**. An AQIA was carried out in accordance with the document, *Approved Methods for the Modelling and Assessment of Air Pollutants in NSW* (2005).<br><br>An assessment of the potential human health risks associated with the processing of SPL is included in **Section 7.3**.<br><br>Stormwater controls are described in **Section 7.6** and environmental controls considering mosquito management and separation of process water are described in **Section 2.4**.<br><br>An environmental risk review is proved in **Section 6.0**. |
| Roads and Maritime Services | Roads and Maritime Services (RMS) made comment regarding the preparation of a Traffic Impact Assessment for the Project.<br><br>Further additional consultation was undertaken to clarify feedback received from RMS to support preparation of the EA. Issues discussed included:<br><br>• The existing traffic environment in general, including the current Old Punt Road intersection configuration and historic upgrade of this intersection providing slip lanes and dedicated turning lanes;<br>• The proposed increase in traffic movements associated with the Project compared against the comparatively high number of existing traffic | Based on additional consultation and discussions with RMS it is considered that the EA adequately addresses the scope of the Traffic Impact Assessment required for the Project.<br><br>The RMS Guide to Traffic Generating Developments includes a schedule of consultation and points of referral for any development. An industrial development that is of a scale less than those on Schedules 1 and 2 of the RMS Guide |

| Stakeholder Contacted | Summary of Issues Raised by Stakeholders | Proponent Response |
|---|---|---|
| | movements along the Pacific Hwy;<br>• The capacity of the existing intersection compared to current and proposed traffic movements; and<br>• The applicability of SIDRA modelling with respect to the proposed Project. RMS agreed that SIDRA modelling may not be appropriate for all projects depending on a range of factors including the scale of the activity with respect to the existing traffic environment. The current EA may consider the applicability of SIDRA modelling and provide context to alternate assessment methodologies where these are considered more appropriate. | does not require RMS consultation. The Project would result in fewer additional movements than identified in Schedules 1 and 2 and is considered to have negligible impact.<br>The traffic section of the 2009 EA was reviewed during the preparation of this EA. The findings of the traffic assessment have been updated in this EA, where necessary using available data. These findings have been confirmed to still be relevant and applicable to the Project as modified in this EA.<br>An assessment of the heavy vehicle haul routes to and from the Facility has been incorporated into the **Section 7.4**.<br>An assessment of potential traffic impacts is provided in **Section 7.4** of this EA.<br>A quantitative assessment of traffic impacts (e.g. SIDRA modelling) is not anticipated to significantly improve the assessment or understanding of potential traffic impacts.<br>The potential traffic impacts of the Project (as modified) are considered to be relatively consistent with those assessed in the 2009 EA. |
| Fire and Rescue NSW | Further additional consultation was undertaken to obtain feedback from Fire and Rescue NSW to support preparation of the EA.<br>It was noted that a Preliminary Hazard Analysis (PHA) (SKM, 2007) has previously been completed in accordance with Hazardous Industry Planning Advisory Paper No. 6 'Hazard Analysis' for the site as part of the 2009 EA and that modification works would be assessed against the requirements of the State Environmental Planning Policy No 33 – Hazardous and Offensive Development | A preliminary hazard screening and a gap analysis against the existing PHA is provided in **Section 7.2**.<br>The Tomago Aluminium Emergency Response Plan and available firefighting equipment is detailed in **Section 7.2**. |

| Stakeholder Contacted | Summary of Issues Raised by Stakeholders | Proponent Response |
|---|---|---|
| | using a preliminary hazard screening and a gap analysis against the existing PHA.<br><br>FRNSW accepted this approach given that the risk profile would not change significantly as the Project does not; propose to change the materials to be processed, introduce process treatment options, or store significantly increased quantities of material.<br><br>It was requested that information be included in the EA regarding existing emergency response measures, plans or studies as may exist for the Regain or Tomago Aluminium site. | |
| Affected Landholders | Tomago Aluminium Company indicated that the company had no comments or feedback to provide at this stage of the Project. | Landholder consent was provided in support of the application (see **Appendix I**). |

# 6.0 Prioritisation of Issues

An assessment of potential environmental impacts associated with the Project based on existing data and knowledge of the site was carried out. A risk analysis was undertaken to rank these issues according to the level of environmental risk.

## 6.1 Risk Matrix

Potential impacts are ranked according to the risk matrix (refer to **Table 9**) as being a High, Medium, Low or Very Low risk to the environment. The allocation of risk is based upon the following considerations:

**Potential consequences:**

1. *Broad scale environmental impact.*
2. *Regional environmental impact.*
3. *Local environmental impact.*
4. *Minor environmental impact.*
5. *Insignificant environmental impact.*

**Likelihood of adverse impact:**

a. *Almost certain.*
b. *Likely.*
c. *Possible.*
d. *Unlikely.*
e. *Rare.*

**Table 9 Risk Matrix**

| Potential Consequence | Likelihood of adverse impact | | | | | |
|---|---|---|---|---|---|---|
| | | **A** | **B** | **C** | **D** | **E** |
| | **1** | High | High | Medium | Low | Very Low |
| | **2** | High | High | Medium | Low | Very Low |
| | **3** | Medium | Medium | Medium | Low | Very Low |
| | **4** | Low | Low | Low | Low | Very Low |
| | **5** | Very Low | Very Low | Very Low | Very Low | Very Low |

## 6.2 Risk Analysis

The prioritisation of potential environment issues related to the Project is provided in **Table 10**. The ranking aims to allow the prioritisation of issues for assessment and does not consider the application of mitigation measures to manage the environment effects. In all cases, appropriate and proven mitigation measures would be used to minimise and manage potential impacts identified in this risk analyses. These measures are described throughout **Section 7.0** of this EA and are summarised in **Section 8.0**.

**Table 10 Prioritisation Analysis**

| Environmental Aspect | Potential Environmental Issue | Consequence | Likelihood | Ranking |
|---|---|---|---|---|
| Air Quality and GHG | Generation of fugitive emissions and dust. | 3 | C | Medium |
| | Excessive generation of GHG, including carbon dioxide, methane and oxides of nitrogen | 4 | E | Very Low |
| Hazard and Risk | Hazards due to risk of incidents at plant. Potential contaminants impacting nearby production systems and products. | 3 | C | Medium |
| Human Health | Risk to human health as a result of contact with hazardous waste through air emissions | 3 | D | Low |
| Traffic and Transport | Traffic impacts during construction and operation | 4 | D | Low |
| Noise and Vibration | Noise impacts to nearby residential receivers | 4 | D | Low |
| Waste Management | Generation of hazardous waste requiring disposal | 3 | E | Very Low |
| Soil and Water | Spills of raw material to site catchment and pollution of local waterways | 4 | D | Low |
| Visual Amenity | Minimal change to current site footprint | 5 | E | Very Low |
| Heritage | Minimal change to current site footprint | 5 | E | Very Low |
| Ecology | Minimal change to current site footprint | 5 | E | Very Low |
| Social and Economic | Potential impacts and benefits to the local and wider community. | 5 | E | Very Low |
| Cumulative Impact | Potential impacts taking into account other existing and approved development in the area | 4 | D | Low |

## 6.3 Key Issues

Based on the risk analysis presented above and consultation with DP&E the key issues requiring detailed assessment within this EA were identified and include:

- Air quality;
- Hazard and Risk;
- Human Health;
- Traffic and Transport;
- Noise and Vibration;
- Soil and Water Quality; and
- Waste.

These key issues are assessed in **Sections 7.1** to **7.7** of this EA. Other issues having very low or no anticipated impact are addressed in **Section 7.8**.

# 7.0 Environmental Assessment

All specialist inputs prepared to support this EA were composed by suitably qualified technical specialists in the relevant field. Technical specialists included the following:

- Air Quality: David Rollings, Associate Director – Air Quality and Colin Clarke – Senior Environmental Scientist.
- Hazard and Risk: Kurt Thoren, Senior Process Safety Engineer and Yu Nee Lee, Process Safety Engineer.
- Human Health: Amanda Lee, Technical Director – Environment and Cindy Cheung, Senior Environmental Engineer.
- Traffic and Transport: Anoop Sridhar, Principal Traffic Engineer and Martin Mallia, Principal Traffic Engineer.
- Noise and Vibration: Geoffrey Lucas, Principal Acoustic / Vibration Engineer and Gayle Greer, Acoustics Team Leader – NSW.

## 7.1 Air Quality

An AQIA has been prepared for the Project as modified (AECOM, 2018). The AQIA employed a conservative assessment methodology to consider both the potential incremental and cumulative impacts of the Project. The assessment was undertaken in accordance with the NSW Environment Protection Authority (EPA) *Approved Methods for the Modelling and Assessment of Air Pollutants in NSW* (Approved Methods) (EPA, 2017). The AQIA considered the following pertinent information:

- The Newcastle air shed background pollutant concentrations; and
- The proposed operational parameters and emissions for the Regain Tomago facility whilst operating at proposed maximum pollutant concentration limits (based on those currently listed in EPL 13269).

Air emissions were modelled using the CALPUFF dispersion model in accordance with the Approved Methods (EPA, 2017) and based on emission points identified in **Section 2.5**.

Predicted emission rates associated with increased processing capacity of 60,000 tpa at the Regain Tomago facility were estimated based on historical stack emissions testing parameters obtained from Regain facilities operated at Tomago, Kurri Kurri and Point Henry. These plant elements have operated for a number of years and the operational performance of these elements is well understood.

Based on years of historical stack emissions testing data from the Regain facility, it is considered that adopting maximum proposed EPL concentration limits to determine the mass emission rates for the Project is a conservative approach. Historic operations and monitoring of the Regain facility has demonstrated that all stack pollutant concentrations levels are typically recorded below the maximum emission limits specified under EPL 13269.

For the purposes of the assessment the facility was assumed to operate 24 hours a day, seven days per week (consistent with current operations). It is considered that this approach provides a conservative assessment with actual emissions generated by the facility likely to be less than those predicted by the dispersion model.

A summary of the AQIA is provided below. The complete AQIA is provided at **Appendix D** .

### 7.1.1 Existing Environment

The EPA currently operates a continuous monitoring station at Beresfield, approximately 5km from the Regain Tomago site, to help characterise the air quality in the region. The pollutants which are monitored at the Beresfield site and relevant to this assessment are oxides of nitrogen (NOx), ozone, fine particulate matter ($PM_{10}$) and sulphur dioxide ($SO_2$) (see **Table 11**).

**Table 11 NSW EPA Beresfield Monitoring Station Data Summary 2015**

| Parameter | $NO_2$ 1hr Average | | $SO_2$ 1hr Average | | CO 1hr Average | | $PM_{10}$ 24hr Average |
|---|---|---|---|---|---|---|---|
| | pphm | µg/m³* | pphm | µg/m³* | ppm | mg/m³ * | µg/m³ |
| Maximum | 4.9 | 92.1 | 8.2 | 214.8 | N/A | N/A | - |
| Average | 0.9 | 16.9 | 0.1 | 2.7 | N/A | N/A | - |
| ***NSW EPA 1 hr Average Criterion*** | ***12*** | ***246*** | ***20*** | ***570*** | ***25*** | ***30*** | - |
| Max 8 hr Average | - | - | - | - | 1.5[#] | - | - |
| ***NSW EPA 8 hr Average Criterion*** | - | - | - | - | ***9*** | ***10*** | - |
| Max 24 hr Average | - | - | 0.8 | 22.2 | - | - | **64.9**[1] |
| ***NSW EPA 24 hr Average Criterion*** | - | - | ***8*** | ***228*** | - | - | ***50*** |
| Max Annual Average | 0.9 | 16.9 | 0.1 | 2.7 | - | - | 18.7 |
| ***NSW EPA Annual Average Criterion*** | ***3*** | ***62*** | ***2*** | ***60*** | - | - | ***30*** |

* converted at 0'C as per NSW EPA criteria correction

[1] Two exceedances of the ambient background concentration for Max 24hr $PM_{10}$ results were recorded as the result of 'exceptional events' (e.g. bushfire or dust storm). The highest concentration reported that is compliant with the criteria was 43.3 µg/m³.

N/A = Result not available from Beresfield Monitoring Station

[#] Result taken from the latest (2015) NSW Air NEPM Compliance Report, and is a max 8-hour rolling average from the Newcastle EPA Monitoring site

In addition to the Beresfield monitoring station data from the Beresfield, TAC monitors Sulfur Dioxide and Fluoride concentrations surrounding the smelter in accordance with EPL 6163. The existing ambient monitoring data obtained from TAC monitoring sites indicated the following:

### Fluoride – Tomago Aluminium Monitoring Network

A summary of the ambient fluoride monitoring results and associated calculated values for EPL Point 21 are provided in **Table 12**.

**Table 12 Tomago Aluminium EPL Point 21 – Ambient Fluoride Results Summary**

| Parameter | Units | Averaging Period | | |
|---|---|---|---|---|
| | | 7-day | 30-day | 90-day |
| Maximum Ground Level Concentration (GLC) | µg/m³ | 1.18 | 0.81 | **0.60** |
| No. of Exceedances | Integer | 0 | 0 | 2 |
| Maximum Non-Exceedance GLC | µg/m³ | 1.18 | 0.81 | 0.20 |
| **Criteria** | **µg/m³** | **1.7** | **0.84** | **0.5** |

It should be noted that the background ambient fluoride concentrations are elevated, with the calculated 90-day average for fluoride showing 2 exceedances of the NSW EPA criteria. The elevated background concentrations for fluoride are expected as a result of the Tomago Aluminium smelter operations, and they also fall within the approved buffer zone surrounding the Tomago Aluminium site.

### Sulfur Dioxide – Tomago Aluminium Monitoring Network

The closest ambient sulfur dioxide monitoring site relative to the Regain facility is EPL Point 36. This monitoring site is located on Laverick Avenue, Tomago approximately 800m south west of the Regain facility. Given the close proximity of this monitoring site in relation to the Regain facility, and its location close to the nearest impacted sensitive receptors in the industrial park, the ambient background concentrations for sulfur dioxide from this monitoring site were adopted for the assessment.

The 2015 monitoring results provided by Regain for the Tomago Aluminium EPL Point 36 $SO_2$ monitoring location are presented in **Table 13**.

**Table 13 Tomago Aluminium Ambient Sulfur Dioxide Results Summary – 2015 (EPL Point 36)**

| Parameter | Units | Averaging Period | | |
|---|---|---|---|---|
| | | 1-hour | 24-hour | Annual |
| Maximum GLC | µg/m$^3$ | 212.2 | 73.4 | 9.8 |
| **Criteria** | **µg/m$^3$** | **570** | **228** | **60** |

It should be noted that the background ambient sulfur dioxide concentrations for all of the monitoring locations are reasonably elevated. The elevated background concentrations for sulfur dioxide are expected as a result of the Tomago Aluminium smelter operations, and they also fall within the approved buffer zone surrounding the Tomago Aluminium site.

### Sensitive Receptors

The area surrounding the facility is largely comprised of medium to large scale industrial premises. The area beyond the industrial premises is largely bound by native vegetation on all sides, with the Hunter River approximately 1km to the south. The closest urban residential receptors are approximately 1.4km from the facility. The Tomago Aluminium site, Regain facility and the surrounding area falling within a range of approximately 2-3km from the Tomago Aluminium site are located within the buffer zone identified in the Tomago Aluminium Development Consent (DA No. 391/80 & DA No. 4908/90).

The TAC smelter buffer zone was designated during the approval process (DA No. 391/80 & DA No. 4908/90) for the third aluminium potline to accommodate an annual emission which was equivalent to 298 tonnes of total fluoride per year (ENSR|AECOM 2009). Impacts from fluoride are monitored in accordance with TAC's environmental monitoring program. Historic results of environmental monitoring indicate that TAC typically operate within their licence conditions, and that the buffer zone appears adequate to contain the impacts of fluoride emissions.

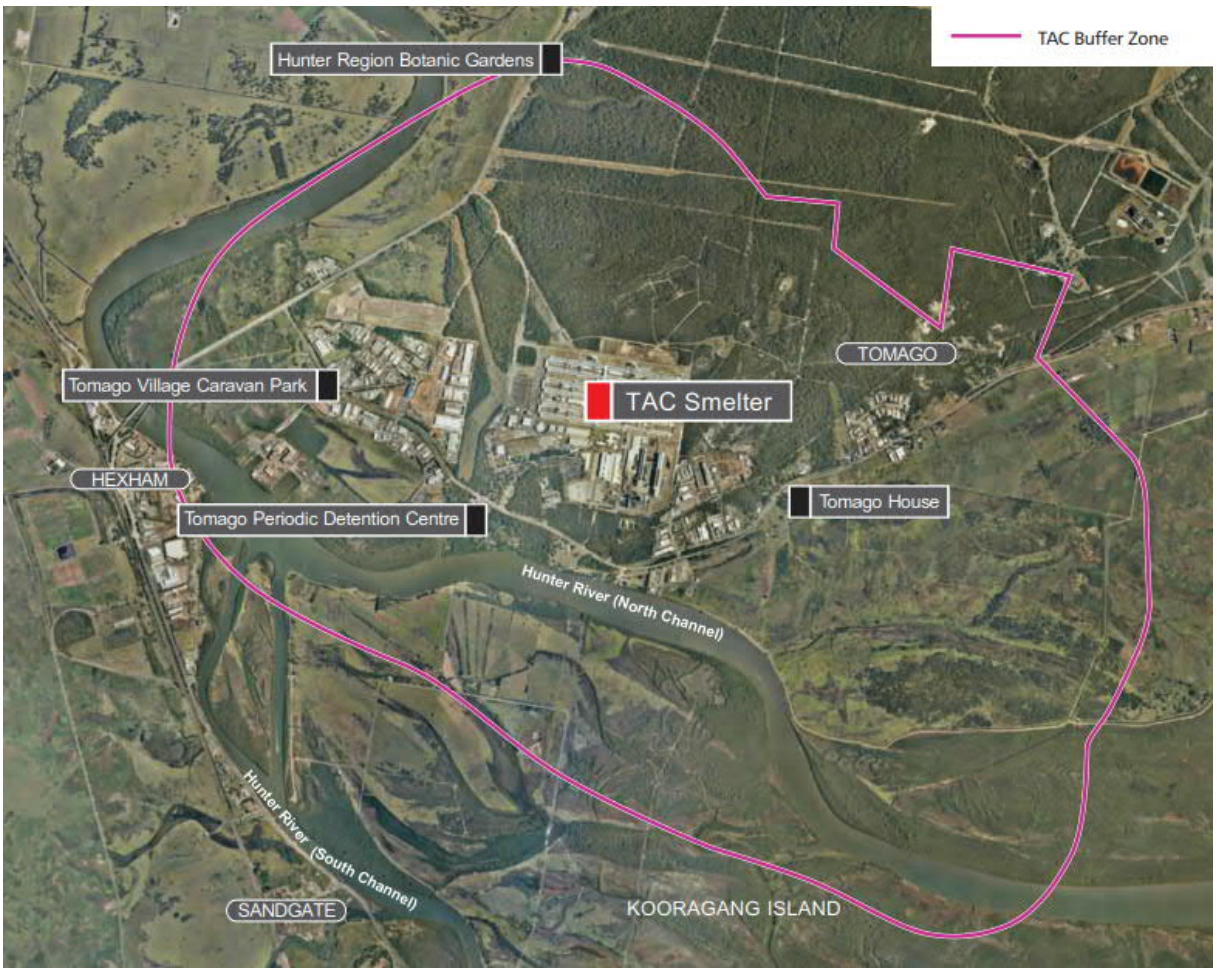

**Figure 7 TAC Buffer Zone (ENSR|AECOM 2009)**

### 7.1.2 Potential Impacts

#### Emission Modelling Results

The predicted maximum cumulative ground level concentrations for the maximum EPL concentrations from the dispersion model are summarised in **Table 14**. The incremental impacts for each pollutant assessed in the modelling have also been expressed as a percentage of the criteria.

The maximum cumulative values are inclusive of the incremental impacts from the site, and the background values identified for the site.

**Table 14 Incremental & Cumulative Predicted Ground Level Concentrations (µg/m$^3$)**

| Pollutant | Averaging Period | Percentile | Assessment Location | Incremental GLC | Incremental % of Criteria | Background GLC | Cumulative GLC | GLC Criteria |
|---|---|---|---|---|---|---|---|---|
| Sulfur Dioxide ($SO_2$) | 1 hour | 100$^{th}$ | Nearest sensitive receptor | 27.30 | 4.8% | 214.8 | 242.10 | 570 |
| | 24 hours | 100$^{th}$ | | 5.28 | 2.3% | 73.4 | 78.68 | 228 |
| | Annual | 100$^{th}$ | | 0.61 | 1.0% | 9.8 | 10.41 | 60 |
| Nitrogen Dioxide ($NO_2$) | 1 hour | 100$^{th}$ | Nearest sensitive receptor | 54.60 | 22.2% | 92.1 | 146.70 | 246 |
| | Annual | 100$^{th}$ | | 1.22 | 2.0% | 16.9 | 18.12 | 62 |
| $PM_{10}$ | 24 hour | 100$^{th}$ | Nearest sensitive receptor | 3.87 | 7.7% | 43.30 | 47.17 | 50 |
| | Annual | 100$^{th}$ | | 0.41 | 1.6% | 18.70 | 19.11 | 25 |
| Lead | Annual | 100$^{th}$ | Nearest sensitive receptor | 0.00056 | 0.1% | N/A | N/A | 0.5 |
| Total Suspended Particulates | Annual | 100$^{th}$ | Nearest sensitive receptor | 0.70 | 0.8% | N/A | N/A | 90 |
| Hydrogen Fluoride | 90 days | 100$^{th}$ | Nearest sensitive receptor | 0.12 | 23.2% | 0.20 | 0.32 | 0.5 |
| | 30 days | 100$^{th}$ | | 0.16 | 18.9% | 0.81 | **0.97** | 0.84 |
| | 7 days | 100$^{th}$ | | 0.22 | 12.9% | 1.18 | 1.4 | 1.7 |
| | 24 hours | 100$^{th}$ | | 0.53 | 18.2% | N/A | N/A | 2.9 |
| Cyanide | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.73 | 0.4% | N/A | N/A | 200 |
| Dioxins & Furans | 1 hour | 99.9$^{th}$ | At or beyond boundary | 7.28E-08 | 3.6% | N/A | N/A | 2.00E-06 |
| PAH | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.36 | 91.0% | N/A | N/A | 0.4 |
| Antimony | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0087 | 0.1% | N/A | N/A | 9 |
| Arsenic | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0064 | 7.1% | N/A | N/A | 0.09 |

| Pollutant | Averaging Period | Percentile | Assessment Location | Incremental GLC | Incremental % of Criteria | Background GLC | Cumulative GLC | GLC Criteria |
|---|---|---|---|---|---|---|---|---|
| Cadmium | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0179 | 99.2% | N/A | N/A | 0.018 |
| Chromium | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.059 | 65.3% | N/A | N/A | 0.09 |
| Manganese | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.35 | 1.9% | N/A | N/A | 18 |
| Mercury | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0056 | 0.3% | N/A | N/A | 1.8 |
| Nickel | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.13 | 70.0% | N/A | N/A | 0.18 |
| Acetone | 1 hour | 99.9$^{th}$ | At or beyond boundary | 6.38 | 0.03% | N/A | N/A | 22000 |
| Benzene | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.59 | 2.0% | N/A | N/A | 29 |
| Toluene | 1 hour | 99.9$^{th}$ | At or beyond boundary | 7.60 | 2.1% | N/A | N/A | 360 |

The predicted maximum cumulative pollutant concentrations were all compliant with their respective GLC assessment criteria, with the exception to of the 30-day Hydrogen Fluoride result. The following observations can be made:

- The incremental PAH & Cadmium concentration represents the pollutants with the highest percentage of the individual pollutant EPA criterion (91% & 99% of the criterion respectively). The maximum incremental GLC's are located on the western boundary approximately 200m from the Regain facility. Based on the emissions inventory, the two rotary kilns are the main source of these pollutants; and
- The pollutants with the highest cumulative concentrations when compared to the NSW EPA criteria were Hydrogen Fluoride & $PM_{10}$. Hydrogen Fluoride has the highest cumulative result, at 115% of the criteria for the 30-day averaging period, and the cumulative 24-hour $PM_{10}$ result at 94% of the criteria. Whilst the cumulative impacts for these pollutants are notable, and in the case of Hydrogen Fluoride, elevated above the GLC criteria, the incremental Hydrogen Fluoride and $PM_{10}$ Regain contributions at the same location are small considering existing industrial operations within the locality.

### TAC Smelter Buffer Zone

A buffer zone was designated during the approval process for the third potline at Tomago Aluminium to accommodate an annual emission equivalent to 298 tonnes of total fluoride per year. The load limit is identified as a condition to EPL 6163. TAC prepare an annual NPI report which includes their fluoride emission load for each year to assess emissions against their load limits. A summary of results from the TAC smelter over the previous 5 years is provided in **Table 15** below.

**Table 15 Annual Fluoride Load by NPI Reporting Year**

| NPI Reporting Year | Annual Fluoride Load – Air Total (T/yr) |
|---|---|
| 2012-13 | 280 |
| 2013-14 | 260 |
| 2014-15 | 260 |
| 2015-16 | 240 |
| 2016-17 | 240 |
| **EPL 6163 Load Limit** | **298** |

The data shows that there has been a reduction in fluoride emissions of approximately 40 tonnes per year of the annual fluoride load within the buffer zone surrounding the aluminium smelter over the last five years (from 280T/yr in the 2012/13 reporting year, to 240 T/yr in their most recent NPI report). The annual fluoride load on the buffer zone surrounding the aluminium smelter is therefore approximately 60 T/yr lower than the currently approved load limit.

Based on the data presented in the AQIA provided in **Appendix D**, the maximum potential contribution to the annual fluoride load on the buffer zone surrounding the aluminium smelter associated with the proposed Regain Tomago operations is provided in **Table 16**.

**Table 16 Estimated Flouride Load (T/yr) contributions for the Regain Facility**

| Parameter | 20,000 tpa Rotary Kiln | 40,000 tpa Rotary Kiln |
|---|---|---|
| Fluoride Emission Rate (g/s) | 0.04261 | 0.04935 |
| Total Annual Fluoride Load (T/yr) | 1.344 | 1.557 |
| Total Regain Fluoride Load (T/yr) | 2.901 | |

The maximum potential Regain contribution to the annual fluoride load on the buffer zone is less than 3 T/yr. It should be noted that this is a theoretical worse case value based on Regain operating at their maximum proposed stack EPL Concentration limits. Based on historical stack testing results from the current Regain facility, the annual fluoride load is likely to be significantly less when based on average stack testing fluoride concentrations. It is considered that the small potential increase associated with the proposed Regain operations are unlikely to adversely affect the condition of vegetation in the Botanic Gardens and surrounding areas within the buffer zone.

On the basis of the above data, there is not expected to be a noticeable change to the overall fluoride entering the airshed around the Tomago Aluminium smelter due to Regain. The contribution from the Regain facility is expected to be negligible when compared with Tomago emissions over the last 5 years.

Potential impacts to surface water and groundwater quality (including the Tomago Sandbeds, which is partially located within the buffer zone) associated with potential air quality impacts are discussed in **Section 7.6.2**.

### Product Handling

The Project has the potential to increase the frequency of truck delivery and despatch from the facility. SPL material and product handling practices proposed for the Project are described in **Section 2.3**.

The reconfiguration of plant elements requires modification of dust extraction processes but does not increase the potential for fugitive dust emission as the design approach remains substantially the same as the originally approved development. Emission controls proposed for the Project are described in **Section 2.4**.

SPL unloading practices would remain broadly consistent with those described in the 2009 EA with trucks entering Shed 5 to be unloaded within an enclosed environment. Shed 5 is fitted with rumble grids which would minimise the potential for SPL material to be tracked from site. SPL material would be prepared for further processing in Shed 5 (within an enclosed environment) before being conveyed to the thermal treatment plants by enclosed conveyor.

Once thermally treated the product is transferred via an enclosed conveyer system to the Shed 6 storage building which opens to the environment via two large doorways, which can accommodate a front end loader. The dry material is wetted inside the storage building to achieve a moisture content of approximately 5-7%, to minimise the potential for the generation of dust, particularly during bulk truck loading operations.

Truck loading operations take place within the bunded courtyard area between the two large sheds at the Regain facility, whereby the front end loader collects product from Shed 6, and loads the truck outside. Loading activities only taking place during dry weather, with any spillages cleaned up and the loading area swept regularly to maintain good housekeeping practices. Trucks are covered upon completion of the loading activities before they leave the Regain facility.

It is considered that the handling practices and environmental controls implemented as part of the Project (see **Section 2.4**) would effectively minimise the potential for dust generation. Therefore the Project as proposed is not considered to substantially increase the potential for dust emissions from site when compared to the originally approved development.

### Greenhous Gas Inventory

It can be seen from **Table 17** there would be an increase in the GHG emissions from the existing to the proposed operations with estimated total GHG emissions changing from 1,611 $CO_2^{-e}$t/y to 4,834 $CO_2^{-e}$ t/y. This is largely attributed to the operation of the additional rotary kiln, increasing production from 20,000tpa to 60,000tpa.

When predicted GHG emissions from the proposal are compared to state and national GHG emissions for 2016, the facilities contribution is relatively small, contributing 0.0044% of NSW, GHG emissions and 0.0011% of national emissions accounting for Scope 1 and Scope 2 emissions (NGER, 2018).

**Table 17 Existing and Proposed GHG Emissions ($CO_2^{-e}$t/y)**

| Source | Type | Current Production (20 kT/y) | | Proposed Production (60 kT/y) | |
|---|---|---|---|---|---|
| | | Qi Value | Emissions ($CO_2$-e t) | Qi Value | Emissions ($CO_2$-e t) |
| Natural gas consumption | Scope 1 | 24,000 | 1,237 | 72,000 | 3,710 |
| Diesel (Vehicles) | Scope 1 | 40 | 109 | 120 | 327 |
| Electricity consumption | Scope 2 | 320,000 | 266 | 960,000 | 797 |
| **Total** | | | **1,611** | | **4,834** |

Further it is considered that the Project provides substantial environmental benefits through the reuse of treated product (e.g. HiCAl 30) within industry. A life cycle assessment undertaken for HiCAl 30 was undertaken to quantify the potential benefits in the cement clinkering and cement manufacture process.

The Regain facility produces HiCAl 30 at its Tomago facility. The HiCAl 30 product is rich in fluoride sodium, alumina and carbon and is used in the Cement industry for cement clinkering. The high content of fluoride and sodium in HiCAl 30 have a mineralising affect and increases the reactivity of the clinker thus reducing the amount of clinker required per tonne of cement. This reduction in clinker is important as it reduces GHG emissions and electricity usage for the production of cement.

While Scope 3 GHG emissions are excluded from this assessment, it is important to mention that the continued and proposed increase in production of HiCAl 30 at Regain's facility would result in a reduction in Scope 3 emissions.

Based on the cement production scenario set out in the previous *Indicative Life Cycle Assessment of Regain Products which are derived from By-products of Primary Aluminium Smelting (Regain 2014),* the use of HiCAl 30 can result in a reduction in the ratio of clinker to cement (the clinker factor) from 80 percent to 74 percent. **Table 18** and **Table 19** shows how the reduced clinker factor can result in an overall reduction in both Scope 1 and Scope 2 emissions respectively (or Scope 3 in the context of Regain) under both the exiting 20,000 tpa production rate and the proposed 60,000 tpa production rate.

**Table 18 Scope 3 Emission Reductions from HiCAl 30 Product in Cement Production**

| HiCAl Production (t/y) | $EF_{ij}$ | $EF_{tocj}$ | Clinker Production (t/y) | Cement Production (t/y) | Calcination[1] | Clinker Factor[2] | $CO_{2\text{-}e}$ Emitted (tonnes) | $CO_{2\text{-}e}$ Reduction (tonnes) |
|---|---|---|---|---|---|---|---|---|
| 20,000 | 0.534 | 0.01 | 1000000 | 1,250,000 | 1.0 | 0.80 | 1,224,000 | 40,800 |
| | 0.534 | 0.01 | 925000 | 1,250,000 | 1.0 | 0.74 | 1,183,200 | |
| 60,000 | 0.534 | 0.01 | 3000000 | 3,750,000 | 1.0 | 0.80 | 3,672,000 | 122,400 |
| | 0.534 | 0.01 | 2775000 | 3,750,000 | 1.0 | 0.74 | 3,549,600 | |

Note: Emission calculated using Method 1 for Clinker Production under the *National Greenhouse and Energy Reporting Scheme Measurement; Technical Guidelines for the estimation of emissions by facilities in Australia* (2017-2018)

1. Refers to the degree of calcination of cement kiln dust produced as a result of the production of cement clinker during the year, expressed as a decimal fraction. A default value of 1 has been adopted.
2. Clinker Factor Based on *Indicative Life Cycle Assessment of Regain Products which are derived from By-products of Primary Aluminium Smelting* (Regain 2014)

**Table 19 Scope 3 Emission Reductions from HiCAl 30 Product For Electricity Used in Cement Production**

| HiCAl Production (t/y) | Energy Saving[1] (kWh/t) | Energy Saving (KWh/y) | EF | $CO_{2\text{-}e}$ Reduction (tonnes) |
|---|---|---|---|---|
| 20,000 | 320 | 6,400,000 | 0.83 | 5,312 |
| 60,000 | 320 | 19,200,000 | 0.83 | 15,936 |

Note: Emission calculated using NSW Emission Factor for Scope 2 emissions from electricity under the *National Greenhouse and Energy Reporting Scheme Measurement; Technical Guidelines for the estimation of emissions by facilities in Australia* (2017-2018)

1. Energy saving based on *Indicative Life Cycle Assessment of Regain Products which are derived from By-products of Primary Aluminium Smelting* (Regain 2014)

**Table 20** summarises the reduction of Scope 3 GHG emissions within the cement industry for both the existing HiCAl production rate of 20,000 tpa and the proposed production rate of 60,000 tpa. It can be seen from **Table 20**; production of 20,000 tpa of HiCAl product already results in a reduction of 46,112 $CO_{2\text{-}e}$ tonnes per year. Increasing the production of HiCAl to 60,000 tpa could result in an offset of approximately 138,336 $CO_{2\text{-}e}$ tonnes per year. This is an additional 92,224 $CO_{2\text{-}e}$ tonnes per year than currently offset by existing operations.

**Table 20 Summary of GHG Emission Reductions from Scope 3 Emissions**

| HiCAl Production (t/y) | $CO_{2-e}$ Reduction (tonnes) | | |
|---|---|---|---|
| | Cement Production | Electricity Usage | Total |
| 20,000 | 40,800 | 5,312 | 46,112 |
| 60,000 | 122,400 | 15,936 | 138,336 |

It is considered that the potential reduction of approximately 138,336 $CO_{2-e}$ (tonnes) would provide a substantial environmental benefit when compared to the potential generation of 4,834 $CO_{2-e}$ (tonnes) by the facility (as modified).

**Assessment of Potential Impacts to Air Quality**

The AQIA predicts that when considered in isolation (incremental concentration only); no adverse impacts are likely to occur as a result of the facility operating under proposed maximum operational conditions at or beyond the site boundary, or at any sensitive receptor location. When considered cumulatively with background concentrations, there is a potential exceedance of the GLC criteria for the 100$^{th}$ percentile 30-day Hydrogen Fluoride concentration.

The potential for cumulative fluoride exceedances exist due to elevated background concentrations of fluoride, likely related to the operation of the Aluminium smelter. The location of sensitive receptors recording modelled elevated cumulative ground level concentrations for Hydrogen Fluoride are located approximately 200m to the west of the Regain facility, beyond the Tomago Aluminium boundary. These receptors are located within the nearby industrial estate, which fall within the Tomago Aluminium buffer zone.

Guidance from the ANZECC (1990) document from which the NSW EPA limits are derived, indicates that the intent of the ambient fluoride criteria was for application at receptors where sensitive vegetation or grazing animals are located. Neither of these sensitive receptor types are present at the industrial receptors identified as having cumulative concentrations above the criteria in this assessment.

The increase in incremental fluoride concentrations associated with the Regain operations are predicted to be minor at these industrial receptor locations and as such are unlikely to cause any significant additional environmental impact beyond the elevated background concentrations already present in the environment. As such, the assessment indicates that the proposed modification to the Regain facility is not predicted to cause any potential increase in environmental harm associated with any of the pollutants examined in this AQIA when operating at the maximum permitted stack concentration limits.

A GHG inventory was also prepared as part of this assessment, which predicts an increase in GHG emission intensity associated with the increased production capacity, however the facilities overall contribution is very small to the state and national GHG emissions, and not expected to be of concern.

In summary it is considered that the potential air quality impacts associated with the Project (as modified) are likely to remain substantially the same as the original approved development.

### 7.1.3 Mitigation Measures

**Environmental Controls**

The environmental controls nominated in **Section 2.4** would be implemented during operation of the facility to minimise dust generated by the Project and capture and control fugitive emissions. The following additional mitigation measures are proposed:

- All mobile plant and equipment would be appropriately maintained and operated;
- Energy usage would be minimised where appropriate to do so; and
- The thermal treatment process would be optimised to maximise efficiency where practical and subject to operational requirements. For example by coordinating batch processing to minimise energy wasted during initial heating of the rotary kiln to operating temperature.

### Modification of EPL Limits

A new cadmium emission limit of 0.025 mg/m$^3$ would be implemented for both EPL Point 1 and 2A, to ensure compliance with ground level concentration limits. The proposed Cadmium limit is achievable under normal operating conditions, based on years of historical stack emissions testing results. The facility would operate in accordance with the concentration limits proposed in **Table 21**.

**Table 21 Proposed EPL Concentration Limits**

| Pollutant | Units | 20,000 tpa Rotary Kiln Stack (EPL Point 1) | 40,000 tpa Rotary Kiln Stack (EPL Point 2A) | Drying Plant Stack (EPL Point 2B) | Shed 5 Stack (EPL Point 3) | Fine Grinding Plant Stack (EPL Point 4) |
|---|---|---|---|---|---|---|
| Cadmium | mg/m$^3$ | **0.025** | **0.025** | N/A | N/A | N/A |
| Cyanide | mg/m$^3$ | 1 | 1 | N/A | N/A | N/A |
| Dioxins & Furans | ng/m$^3$ | 0.1 | 0.1 | N/A | N/A | N/A |
| Fine Particulates ($PM_{10}$) | mg/m$^3$ | 10 | 10 | 10 | 10 | 10 |
| Nitrogen Oxides (Equivalent $NO_2$) | mg/m$^3$ | 100 | 100 | N/A | N/A | N/A |
| Polycyclic Aromatic Hydrocarbons | mg/m$^3$ | 0.5 | 0.5 | N/A | N/A | N/A |
| Sulfur Dioxide | mg/m$^3$ | 50 | 50 | N/A | N/A | N/A |
| Total Fluoride | mg/m$^3$ | 5 | 5 | N/A | N/A | N/A |
| Total Solid Particulates | mg/m$^3$ | 20 | 20 | 20 | 20 | 20 |
| Type 1 & 2 Substances | mg/m$^3$ | 1 | 1 | N/A | N/A | N/A |
| Volatile Organic Compounds | mg/m$^3$ | 20 | 20 | N/A | N/A | N/A |

### Emissions Monitoring

The Regain Tomago Environment Protection License (EPL) No. 13269 currently requires stack emissions testing of EPL Point 1 (20,000 tpa Rotary Kiln stack) to be undertaken on a biannual basis whilst processing both 1$^{st}$ Cut and 2$^{nd}$ Cut SPL.

With the installation of the new plant, and operation of five point sources onsite, Regain propose to conduct emissions monitoring as outlined in **Table 22**.

**Table 22 Proposed EPL No. 13269 Emissions Monitoring**

| EPL Point | Stack Name | Feed Material | Frequency | Pollutants |
|---|---|---|---|---|
| 1 | 20,000 tpa Rotary Kiln Discharge Stack | 1st Cut & 2nd Cut | Biannual | Nitrogen Oxides<br>Type 1 & 2 Substances<br>Fine Particulates ($PM_{10}$)<br>Polycyclic Aromatic Hydrocarbons (PAH)<br>Sulfur Dioxide<br>Dioxins & Furans<br>Total Solid Particulates (TSP)<br>Cyanide<br>Total Fluoride<br>Cadmium<br>Volatile Organic Compounds |
| 2 | 40,000 tpa Rotary Kiln Discharge Stack | 1st Cut & 2nd Cut | Biannual | Nitrogen Oxides<br>Type 1 & 2 Substances<br>Fine Particulates ($PM_{10}$)<br>Polycyclic Aromatic Hydrocarbons (PAH)<br>Sulfur Dioxide<br>Dioxins & Furans<br>Total Solid Particulates (TSP)<br>Cyanide<br>Total Fluoride<br>Cadmium<br>Volatile Organic Compounds |
| 3 | Shed 5 Discharge Stack | Any | Biannual | Total Solid Particulates (TSP)<br>Fine Particulates ($PM_{10}$) |
| 4 | Fine Grinding Plant Discharge Stack | Any | Biannual | Total Solid Particulates (TSP)<br>Fine Particulates ($PM_{10}$) |
| 5 | Dryer/Blending Discharge Stack | Any | Biannual | Total Solid Particulates (TSP)<br>Fine Particulates ($PM_{10}$) |

## 7.2 Hazard and Risk

A Preliminary Hazard Assessment (PHA) (SKM, 2007) was previously undertaken as part of the 2009 EA for the SPL Facility. For the purposes of this EA, the proposed modification was assessed against the requirements of *SEPP 33* using a preliminary hazard screening, and a gap analysis against the existing PHA was completed. The existing PHA is attached at **Appendix E** and the results of the gap analysis are discussed below.

### 7.2.1 Existing Environment

**SPL Material**

SPL is classified as a Dangerous Good and an Environmentally Hazardous Waste. It requires careful handling and disposal in accordance with regulatory requirements. SPL materials are currently stored at the Tomago smelter in a number of secure, dry storage sheds prior to disposal. Historically, SPL has been shipped internationally for processing.

**Products**

As outlined in **Section 2.7**, HiCAl products are currently used at the Regain facility. HiCAl products are summarised below:

- HiCAl 30 Mineralising Carbon;
- HiCAl 40 Mineralising Carbon;
- HiCAl-R Clinker Mineraliser; and
- HiCAl-S Clinker Mineraliser.

HiCAl products are not classified as Dangerous Goods. Safety Data Sheets (SDS) and a HiCAl Products Portfolio Technical Document have been prepared and are included as **Appendix G**.

Testing of the treated SPL material and blending carbons has identified that the dusts are not combustible over a concentration range up to 2000 g/m$^3$ (SIMTARS Final Report R206-0076-17/18). As such, the treated SPL and blending carbon material within Shed 6 is not considered to introduce a risk of dust explosions. However the SDS documents do recommend consideration of combustible dust hazard controls in firefighting measures.

**Hazards Associated with SPL**

The facility is currently used to treat and recycle waste SPL material from the aluminium smelting process, with a maximum processing capacity of 20,000 tonnes per annum. SPL is also delivered by road from other aluminium operations including the Hydro Aluminium facility at Kurri Kurri. SPL is unloaded into dedicated storage bays in Shed 5. Front end loaders load the SPL into the crushing-sizing circuit, as required. The crushed material is then loaded onto conveyor systems for hydro-thermal treatment.

Following thermal treatment the SPL material is no longer a dangerous good and is conveyed from the thermal treatment plant for storage in Shed 6. The processed material is then stockpiled in Shed 6, available for product manufacture.

A number of environmental controls and safeguards are currently installed at the site:

- Protection of SPL storage – SPL material is stored in dedicated sheds with two large doorways and dust extraction to manage potential dust escape from the preparation and storage area;
- Enclosed external plant – while not within a building, the process plant is enclosed such that there are no open material transfer points and plant is connected to dust extraction systems;
- Dust extraction – dust extraction systems are provided for the facility. The dust extraction systems are negative pressure systems fitted with filter bag units and stacks directed to safe release locations;
- Alarms and shutdown trips – the dust extraction systems are provided with monitoring systems which activate visual and audible alarms within plant buildings to shut down the process in the event of failed dust extraction;
- Baghouse temperature monitoring – the alarm system would be activated by elevated baghouse temperatures which could damage the filter system;
- Bunded loading areas – truck loading and vehicle operation areas are bunded to prevent potential SPL or product spills being released to drains and stormwater channels;
- Stormwater Controls - Rain falling within the bunded courtyard areas is directed to a dedicated first flush settlement chambers and sumps maintained on the Regain site. Rain falling outside the bunded courtyard area is directed to the existing Tomago Aluminium site first flush pond. This pond allows stormwater to be collected and assessed prior to release off-site (in accordance with EPL 6163);
- Rotary kiln temperature control and safety design – thermal treatment plant is provided with a burner management system which controls temperature using feedback from thermocouples within the kiln. Independent high and low temperature alarms are provided to protect against temperature fluctuations. Blast panels are provided to mitigate damage from the unlikely event of a fire or explosion;
- Burner management – an AS1853 compliant burner management system is installed, complete with fuel gas isolation valves and flame detection to protect against gas accumulation in a “flame-out” event; and
- Pollution control – the facility currently operates in accordance with EPL 13269 and Environmentally Hazardous Chemicals Licence #88.

In addition to these controls, a number of safeguards were identified in the PHA (SKM, 2007) that accompanied the 2009 EA for the existing SPL Facility. The safeguards recommended by the existing

PHA are currently in place for the process components installed at the existing facility to date. Further detail in relation to these safeguards is provided in **Section 7.2.3**.

The Regain site is located within the Aluminium Smelter site, utilises existing buildings and hard stand areas previously constructed by Tomago Aluminium and is operated in accordance with the Tomago Aluminium Emergency Response Plan (Issue Date 19/01/2017).

Key aspects of this plan include:

- A three tier level of emergency response incorporating local response measures and site based emergency response teams;
- Dedicated site controls across the site incorporating firefighting water supplies, fire protection systems and first aid firefighting equipment;
- Consideration of the risk of fire or explosions occurring within spent potline storage areas and the potential for overflow of contaminated fire water to storm water systems; and
- Emergency vehicles maintained on site comprising a fully equipped fire and rescue vehicle and dry chemical fire tender with hose reels, SCBA and other equipment available to be deployed during an emergency.
- A clear process of escalation to external emergency services, when required.

### 7.2.2 Potential Impacts

To ensure any potential hazards and risks associated with the Project are captured, the proposed modification was assessed against the requirements of *SEPP 33* using a preliminary hazard screening. A gap analysis against the existing PHA was then completed. The intent of the assessment is to determine the extent to which the existing hazard identification and associated consequence analysis remain applicable for the proposed capacity increase, and whether the existing mitigation measures provide sufficient protection.

**Comparison of Approved and Proposed Facility Layout**

Following the PHA conducted by SKM in 2007, the arrangement of the thermal treatment plant has been altered. The thermal treatment plant was installed on the southern side of the space between Shed 5 and Shed 6, approximately 30 m away from the assessed location on the northern side. The proposed modification will also install an additional thermal treatment plant between Shed 5 and 6. The site layout assessed in the 2007 PHA and the layout proposed as part of the modification works are shown in **Figure 8** and **Figure 9** respectively.

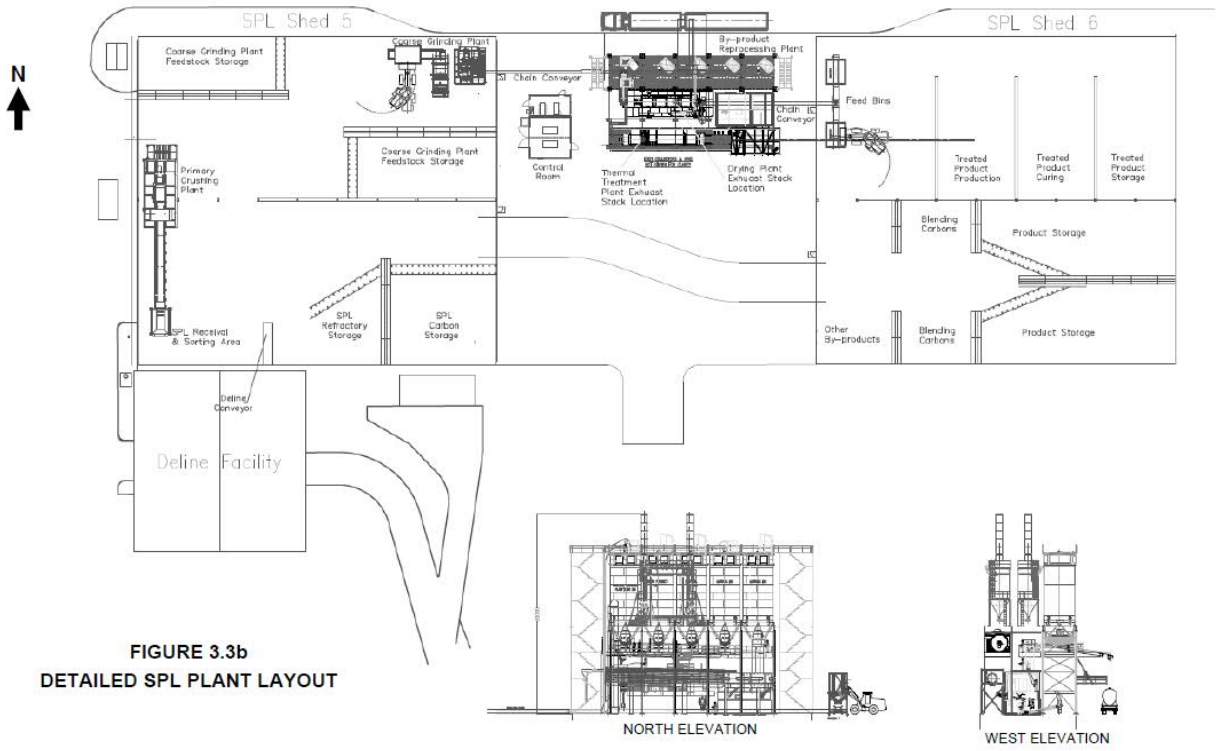

**Figure 8 Plant Layout as per 2007 PHA**

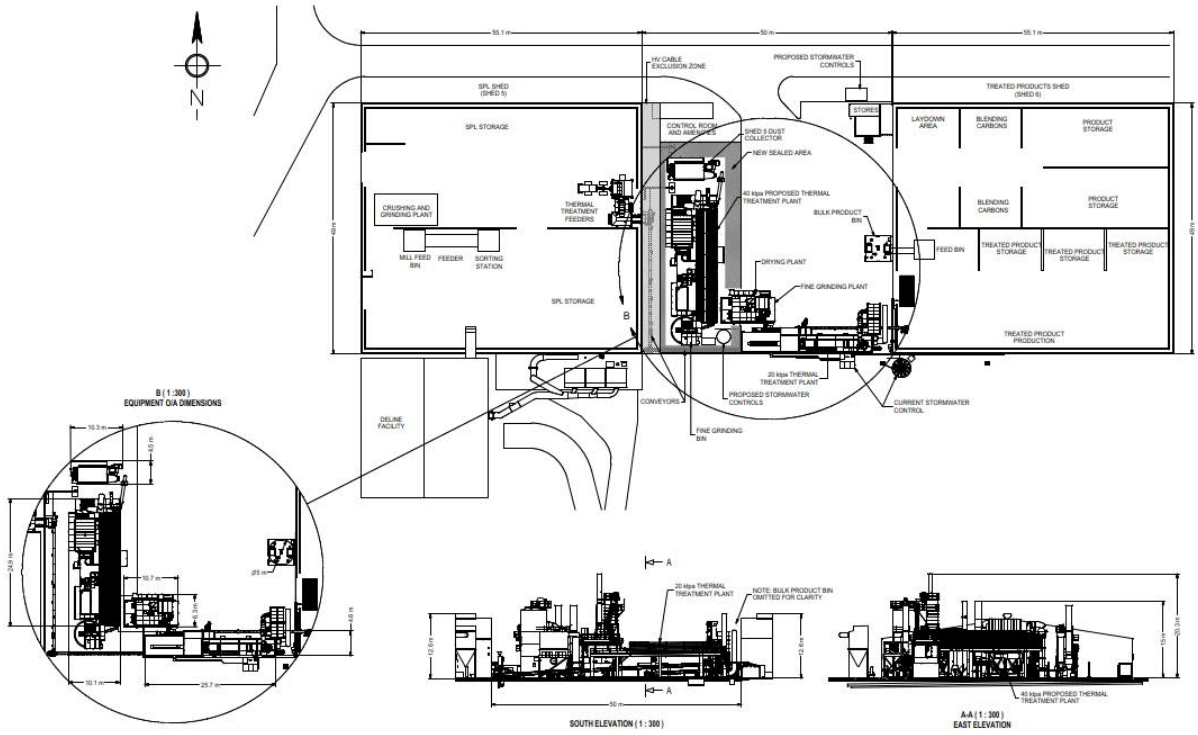

**Figure 9 Plant Layout of Proposed Modification, Including the existing Thermal Treatment Plant**

The PHA conducted in 2007 did not identify any location specific risks which would be significantly impacted by the change in position. Based on the properties of the process and materials involved, the relocation is not considered to introduce any new hazards to the surrounding area. In particular, relocating the conveyor to the south of the area increases clearance to the control building, reducing the potential for dust generation in the area of occupation by workers. The relocation has also increased the distance to the access road on the northern side, improving separation with regards to traffic. Lastly the relocation increases distances from the Tomago Aluminium switchyard located on the northern side of the access road to the Regain site.

The proposed new thermal processing plant (40ktpa) will be located adjacent to the existing thermal treatment plant (20ktpa). Due to the nature of the operations, the location of the proposed modification is not considered to significantly impact the assessment in the original PHA. The plant is located within the existing facility footprint and although the interior layout of the sheds has been modified (mirrored), the type of activity and associated hazards have not been changed.

**Comparison of Approved and Proposed Process and Activities**

The overall SPL treatment process for the proposed increase in capacity is the same as that used for the approved facility. The technology and process applied for the thermal treatment process is the same as the original, and the increase in capacity is achieved by the installation of a second rotary kiln and associated equipment with higher rated throughput. Additional dust control and filtration equipment will be provided for the new equipment to provide safeguards for occupational exposure.

While the thermal treatment technology is unchanged, some improvements to the supporting equipment have been incorporated based on experience with the existing thermal treatment system and application of lessons learned through the Regain Management System. The blending, drying and grinding circuit has been simplified to reduce process complexity, including elimination of the blending plant. In particular, improvements incorporated within the proposed modification include:

1. Progressive improvement of crushing technology for SPL preparation in Shed 5 has seen migration from traditional industrial crushing/grinding equipment to innovative equipment with automated electronic control that:
    a. Reduces operator exposure to SPL with operators in air-filtered equipment cabin operating the crushing and grinding through an automated interface on a mobile electronic device;
    b. Reduces the amount of crushing, grinding and materials handling equipment enabling a much more compact plant in Shed 5 with fewer points of potential dust emission.
2. Continuous improvement collaboration with cement industry customers has established that the cement industry can achieve the significant environmental and economic gains from the sodium fluoride compounds available from SPL with rationalised product sales concentrated on one or two of the products. This has eliminated the need for a Blending Plant and much reduced the volume of material flows through the process.
3. The process plant and truck loading should be located as far from the high voltage switchyard as is practical and the proposed plant is located towards the western and the southern sides of the Shed 5 / Shed 6 courtyard with truck loading in the courtyard.

A comparison of the process technology and operational activities between the existing approved process plant and proposed modification is outline in **Table 23**.

**Table 23 Process Plant Comparison**

| Process Plant Comparison | | | |
|---|---|---|---|
| **Component** | **Current Approved** | **Proposed Modification** | **Impact to Risk Profile** |
| SPL Preparation Plant | SPL Preparation Plant in Shed 5 | No change | None |
| Thermal Treatment Plant | 20,000 tonne per year Thermal Treatment Plant | Current 20,000 tonne per year facility with additional 40,000 tonne per year Thermal Treatment Plant | Process technology unchanged, no new hazards identified<br><br>Increased operational time increases exposure; continuous improvement processes have resulted in application of improved protection measures with increased dust control effectiveness (e.g. filtered operator cabins). Application of dust extraction mitigation measures considered to be effective at controlling dust hazards in line with existing PHA assessment. |
| Blending, drying and grinding equipment | Integrated Grinding and Blending Plant includes blending, drying, grinding, grinding feed bin and four large product bins | Reduced size and complexity of process plant:<br>• Blending plant removed<br>• Separate drying plant<br>• Separate fine grinding plant with feed bin<br>• Single product bin (rationalisation of product) | Reduction and simplification of dust generating processes reduces potential exposure |
| Stormwater Catchment | Single catchment system | Two additional catchment systems | Expansion of existing system functionality, no change |
| **Operational Activities Comparison** | | | |
| **Activity** | **Current Practice** | **Proposed Modification** | **Impact to Risk Profile** |
| Storage of SPL Feed | Storage within Shed 5 | No change | None |
| Feed preparation within Shed 5 | Preparation of feedstock and conveyance to rotary kiln with industrial grinding equipment | Improved grinding equipment and processes with reduced operator interaction | Reduction in exposure to operators and reduction in dust emission |
| Storage of Product | Storage in Shed 6 | No change | None |
| Product Blending | Integrated plant with product blending of commercial products | Separate plants for product preparation, single product with no blending | Reduction in amount of dust generated due to blending, and lower throughput of material |

| Process Plant Comparison | | | |
|---|---|---|---|
| **Component** | **Current Approved** | **Proposed Modification** | **Impact to Risk Profile** |
| Product delivery and dispatch | Delivery and dispatch by road trailer. Bulk loading for dispatch between Shed 5 and 6 and on access road to north | Delivery and dispatch by road trailer. Bulk loading for dispatch between Shed 5 and 6 only | Reduction in exposure risk due to removal of loading at north access road |

Based on the comparison of the existing facility and proposed modification, the activities and process operations to be undertaken do not result in a significant change to the facility risk profile. While the facility will operate more frequently and for longer durations, the hazards are not significantly changed compared to the existing 2009 PHA; the improvement in process technology and lessons learnt during operation of the approved facility are likely to reduce the potential for dust releases within the process. The control measures required are generally consistent with the existing facility, noting that the design of such controls has considered the increased facility throughput (e.g. larger dust collection system).

**Preliminary Risk Screening**

The proposed modification was assessed against the criteria for Potentially Offensive Developments and Potentially Hazardous Developments provided in *SEPP 33* and *Applying SEPP 33* (NSW DP&I, 2011) respectively. Classification as 'Potentially Offensive Development' or 'Potentially Hazardous Development' guides the requirements with regards to hazard management, and forms the basis of the hazard assessment completed as part of this EA.

**Potentially Offensive Development**

*SEPP 33* defines a "Potentially Offensive Development" as:

> *"a development for the purposes of an industry which, if the development were to operate without employing any measures (including, for example, isolation from existing or likely future development on other land) to reduce or minimise its impact in the locality or on the existing or likely future development on other land, would emit a polluting discharge (including for example, noise) in a manner which would have a significant adverse impact in the locality or on the existing or likely future development on other land, and includes an offensive industry and an offensive storage establishment."*

The SPL treatment plant is considered to be a Potentially Offensive Development based on the presence of crushing, grinding and separating works generally, and specifically with the production of cement additives, as per Schedule 3 of the *Environmental Planning and Assessment Regulation 2000*. The facility is considered to have possible impacts based on noise and air releases, and currently operates under EPL 13269.

Potential environmental impacts associated with the proposed modification to air quality, water quality and noise have been assessed in **Section 7.0** of this EA.

**Potentially Hazardous Development**

*SEPP 33* defines a "Potentially Hazardous Development" as:

> *"a development for the purposes of any industry which, if the development were to operate without employing any measures (including, for example, isolation from existing or likely future development on other land) to reduce or minimise its impact in the locality or on the existing or likely future development on other land, would pose a significant risk in relation to the locality:*
>
> *a. to human health, life or property, or*
>
> *b. to the biophysical environment,*
>
> *and includes a hazardous industry and a hazardous storage establishment."*

The facility is intended to process SPL, which is classified as dangerous good due its potential safety hazards. Whilst the proposed modification does not modify the nature of the dangerous goods stored and handled at the facility, an assessment against the criteria has been conducted due to the increase in processing capacity.

To determine the appropriate level of risk assessment for the development, a preliminary hazard screening was carried out in accordance with *Applying SEPP 33* (NSW DP&I, 2011). The assessment considered the storage and handling of hazardous chemicals at the facility as well as transport of SPL material to the facility and export of treated product from the facility.

### *Dangerous Goods Storage*

The SPL Processing Facility stores and handles SPL, which is classified as a Class 4.3 (PG III) dangerous good. Treated SPL and the various HiCAl products are not classified as dangerous goods and are not considered in the Potentially Hazardous screening assessment. Further, the treated SPL and blending carbon products stored and handled within Shed 6 are non-combustible. As such, there is no risk of dust explosions within Shed 6.

The assessment against the threshold limits provided in *Applying SEPP 33* (NSW DP&I, 2011) is provided in **Table 24**.

**Table 24 Dangerous Goods Storage Screening**

| Chemical | UN | DG Class and Packing Group | Threshold | Quantity on Site | Potentially Hazardous? |
|---|---|---|---|---|---|
| Spent Potliner | 3170 | 4.3 (III) | 1 tonne | > 1 tonne | Yes |

Based on the maximum quantity of SPL stored on site for the proposed modification, the SPL Processing Facility is considered to be a Potentially Hazardous Development. It is noted that the existing facility currently exceeds the threshold and is also considered to be Potentially Hazardous. The proposed modification does not change the Potentially Hazardous assessment.

The threshold quantities described in WHS Regulation Schedule 15 are used in the determination of a facility as a Major Hazard Facility (MHF). Schedule 15 does not include threshold quantities for Class 4.3 Packing Group III material. As such, the facility is not considered to be assessable for determination as an MHF.

### *Dangerous Goods Transport*

The proposed modification is expected to increase the number and frequency of truck deliveries of SPL. Total truck movements for the facility are conservatively estimated to increase to 120 truck movements per week based on an expected increase in production to 60,000 tpa. It is conservatively estimated that of these up to a total of 60 trucks would comprise dangerous goods vehicle movements (i.e. trucks transporting untreated SPL material to the site). The assessment against the threshold limits provided in *Applying SEPP 33* (NSW DP&I, 2011) is provided in **Table 25**.

**Table 25 Dangerous Goods Transport Screening**

| Chemical | DG Class and Packing Group | Threshold | | Site Movements | | Potentially Hazardous? |
|---|---|---|---|---|---|---|
| | | Movements / wk | Minimum Quantity per Load (tonne) | Movements / wk | Maximum Quantity per Load (tonne) | |
| Spent Potliner | 4.3 (III) | > 12 | 5 | 60 (total movements) | 45 | Yes |

Based on the Projected number of dangerous goods vehicle movements for the proposed modification, the SPL Processing Facility is considered to be a Potentially Hazardous Development for the transport of dangerous goods. It is noted that the existing facility currently exceeds the threshold and is also considered to be Potentially Hazardous with respect to transport; however the 2009 EA for the existing facility was conducted prior to the 2011 revision of *Applying SEPP 33* (NSW DP&I, 2011) and the requirement for route selection in accordance with *HIPAP No.11 – Route Selection* (NSW DP&I, 2011).

As the facility is Potentially Hazardous for transport, the existing traffic route has been reviewed with consideration of *HIPAP No.11 – Route Selection* (NSW DP&I, 2011) (refer **Section 7.4**). No change to the existing traffic routes are proposed as a result of the Project modification.

**Preliminary Hazard Analysis**

SPL is classified as a Dangerous Good (Class 4.3) and an Environmentally Hazardous Waste. It requires careful handling and disposal in accordance with regulatory requirements. SPL materials are currently stored within Shed 5 in a number of secure, dry storage areas prior to treatment.

The composition of the SPL material is highly variable. Contaminants that impregnate the SPL come from the dross materials, which can contain up to 10% aluminium and sodium nitrides and carbides. The contamination in the SPL is created through the diffusion of dross into the carbon lining and chemical reactions occurring in the pot.

As per testing and investigation performed for the existing PHA (SKM, 2007), the majority of the SPL consists of:

- Non-activated carbon (10 – 70%);
- Aluminium oxide (10 – 30%); and
- Aluminium (10 – 30%).

Despite being a dangerous good, the concentrations of contaminants are below toxic levels and the Safety Data Sheet (SDS) (attached at **Appendix G**), does not list toxic effects. SPL is considered to be relatively non-hazardous due to the low concentrations of the toxic constituents and manageable exposure risks using engineering and procedural controls, as described in the 2007 SKM PHA.

Given the relatively non-hazardous nature of SPL and the lack of nearby sensitive land uses, a qualitative assessment was considered appropriate based on a determination of the facility as a Potentially Hazardous Development and the criteria presented in *Applying SEPP 33* (NSW DP&I, 2011):

> *"A qualitative PHA may be sufficient in the following circumstances:*
>
> - *where the materials are relatively non-hazardous (for example, corrosive substances and some classes of flammables);*
> - *where there are no major worst-case consequences;*
> - *where the technical and management safeguards are self-evident and readily implemented; and*
> - *where the surrounding land uses are relatively non-sensitive."*

As the proposed modification is not introducing additional hazardous material types or processes, the proposed development has been assessed qualitatively through a gap analysis against the PHA (SKM, 2007) prepared for the existing facility. The PHA (SKM, 2007) was conducted in accordance with the 2007 revision of *HIPAP No. 6 – Guidelines for Hazard Analysis* and applied the methodology described in the 2007 revision of the Department of Planning (DoP) *Multi-Level Risk Assessment* for a level 2 analysis. The gap analysis considered potential impacts of the hazardous materials, hazardous incidents and a review of the existing consequence assessment against the revised guidelines.

The gap analysis is presented in **Table 26**.

**Table 26 Gap Analysis Against Existing PHA (SKM, 2007)**

| Element / Consideration (SKM PHA Reference) | Gap Analysis | Does the proposed modification impact the risk profile? |
|---|---|---|
| **Process technology** | | |
| Overall process hazards and operation | No significant change. An additional thermal processing plant and associated equipment will provide additional capacity, but apply the same processing technology as the existing thermal processing plant. Improvements in grinding and material handling processes have been implemented where possible to reduce the potential for dust generation and exposure to personnel.<br>Although the increase in throughput and materials handling will potentially increase dust generation, dust explosions are not considered to be credible as materials testing of the SPL products and blending carbon conducted by Simtars indicates the dusts are not explosible. | No |
| Operation of two kilns | Simultaneous operations (SIMOPS) issues are limited as facilities are located adjacent to each other but have separate supporting infrastructure (e.g. dust extraction and collection). No significant interdependence identified, operating personnel shared across facilities. | No |
| **Hazardous Properties of Materials** | | |
| Spent Potline Material (**Section 4.1 & 4.2**) | The proposed modification does not change the material properties or relative composition of the SPL feed material. While the increased treatment capacity may allow SPL to be obtained from additional sources, the facility currently treats both First Cut and Second Cut SPL. It is considered that the facility is suitable for the expected range of SPL feed materials. | No |
| Product Material (**Section 4.9**) | The proposed modification does not directly impact the quality or type of products produced at the facility. It is noted that treated SPL is no longer considered a dangerous good.<br>A detailed review of the product SDS following the 2007 SKM PHA identified that the constituents of the SPL may include carbon fines which may present a dust explosion hazard.<br><br>Materials testing completed by Simtars on the Shot/Butt Blast Carbon, Thermally Treated 'First Cut' and Thermally Treated 'Second Cut' samples has confirmed that the samples are not explosible over the range of 60 g/m3 to 2000 g/m3 and are not classified as a combustible dust (SIMTARS Final Report R206-0076-17/18). As such, the increased handling frequency and throughput do not increase the risk of dust explosions. | No |

| Element / Consideration (SKM PHA Reference) | Gap Analysis | Does the proposed modification impact the risk profile? |
|---|---|---|
| **Hazardous Incidents** | | |
| Handling SPL Inside Buildings (**Section 4.3**) | The proposed modification will increase the frequency and quantity of material handling operations. The material properties and relative composition of the SPL feed material will not change.<br>The mitigation measures implemented to control dust generation and exposure are considered to remain effective, for instance personnel being located within sealed loader cabins and dust extraction systems. | No |
| Rain and Water Leaks into Building (**Section 4.4**) | The proposed modification does not change the material properties or relative composition of the SPL feed material. The existing sheds were considered to be suitable to prevent volumes of water which may result in flammable or toxic atmospheres (hundreds of kilograms or tonnes). The structures of the existing storage sheds are not being modified. | No |
| Rain Water Carried by Trucks (**Section 4.5**) | The handling and storage areas are separated from truck movement operations, and sufficient quantities of water to result in flammable or toxic atmospheres will not be introduced by water on truck wheels or bodies. The SPL feed material will remain the same, and there are no significant changes to the handling operations with regards to rain water. | No |
| Dust Emissions from Operating Equipment (**Section 4.6**) | The proposed modification does not change the material properties or relative composition of the SPL feed material. Mitigation controls including dust extraction are currently installed at the existing facility, and will be maintained for all existing equipment.<br>A dust extraction system will be provided for proposed plant elements including the drying plant, fine grinding plant and thermal treatment plants. New emission stack with baghouse is being installed to cater for the additional thermal treatment plant. It is noted that the existing PHA considered dust releases from grinding and milling processes. The processes remain generally consistent. | No<br>(Stack emissions covered in Air Quality chapter, **Section 7.1**) |
| Gas Build Up in Rotary Kiln (**Section 4.7.1**) | No change is proposed to the operation of each rotary kiln. Average throughputs will increase but existing controls will remain in operation. | No |
| Rotary Kiln Temperature Deviations (**Section 4.7.2 & 4.7.3**) | No change is proposed to the operation of the rotary kiln. Average throughputs will increase, and the existing controls will remain in operation. | No |
| Thermal Treatment Plant Failure | No change is proposed in the operation of the Thermal Plant. Fan failure alarms and control | No |

| Element / Consideration (SKM PHA Reference) | Gap Analysis | Does the proposed modification impact the risk profile? |
|---|---|---|
| (**Section 4.8**) | systems would be employed during operation. | |
| **Consequence Assessment** | | |
| Gas Release from Water Mixing (Appendix B of PHA) | The proposed modification does not change the material properties or relative composition of the SPL feed material. While the increased treatment capacity may allow SPL to be obtained from additional sources, the facility currently treats both First Cut and Second Cut SPL. It is considered that the material reactivity and potential for gas release will not be changed by the proposed modification. | No |
| **Approach and Methodology** | | |
| *HIPAP* and *Multi-Level Risk Assessment* | As the proposed modification meets the criteria in *Applying SEPP 33* for a qualitative assessment, the Level 2 assessment conducted for the existing facility in accordance with *HIPAP No.6* and *Multi-Level Risk Assessment* is considered to be of an appropriate level for the proposed modification.<br><br>Considering the nature of the feed SPL material in combination with the existing and proposed safeguards, the proposed development is not considered to have any significant off-site impacts and the risks are adequately controlled. The proposed modification is considered to be acceptable based on the qualitative criteria in *HIPAP No.4*. | N/A |

Based on the analysis conducted in the PHA (SKM, 2007) and the Preliminary Screening Analysis prepared for the proposed modification in **Section 7.2.2**, the hazards associated with the proposed increase to processing capacity of SPL at the Regain facility do not result in a change to the existing risk profile as a result of the proposed modification.

Potentially offensive impacts from air, noise and water pollution are addressed in **Sections 7.1**, **7.5** and **7.8** respectively. A route selection study has been prepared and is discussed in **Section 7.4**.

### 7.2.3 Mitigation Measures

Regain commits to the ongoing implementation of environmental controls and safeguards identified in **Section 2.4** and summarised below during operation of the facility.

- Dust control – Storage and handling areas for SPL feed material would be provided with dust extraction systems to capture any dust generated during handling activities and deliver it to bag-houses. Material handling operations would not be permitted unless extraction systems are operational. Operations personnel would be located in sealed vehicle compartments during handling activities.
- Process Dust Control – Process equipment is enclosed and fitted with dust extraction systems to capture fugitive emissions. Process unit dust extraction systems are directed to bag-house units. The ball mill will be provided with dust extraction to a new emission stack. Product hoppers are fitted with hoods to minimise dust generation of non-dangerous goods products.
- Water ingress Control – The storage areas are fully sealed and process equipment is enclosed. Bunds are provided for all storage and process areas. Trucks generally do not enter the storage area unless unloading, and the amount of water entrained on loaders and equipment is not sufficient to generate significant amounts of flammable or toxic gases.

- Bag-houses – Bag-houses are fitted with continuous control and monitoring systems, with high and low differential pressure (blockage and breakage) and high temperature alarms to protect against bag failure.
- Furnace Operations – The furnace is provided with a burner management system in accordance with Australian Standard AS1853 to isolate fuel gas on flame-out and monitor process conditions. Blast panels are provided to limit potential damage in the unlikely event of an internal furnace explosion. Kiln is located away from site boundaries and there is additional separation to industrial areas from site buffer zone.
- Furnace Controls – The burner management system maintains the furnace temperature to prevent over- or under-temperature within the furnace. High and low temperature alarms and controls are provided to alert operations to temperature fluctuations and automatically shut down the plant when required.
- Thermal Treatment Plant Fan – Failure of gas supply shuts down all systems, reducing potential for creation of uncontrolled flammable atmosphere. The hydro mixer is relatively small, and once water supply is isolated the quantity of gas is significantly reduced. During a shutdown, the exhaust fan and dust collector continues for a period to ensure adequate ventilation.
- Treated products stored in Shed 6 and Bulk Product Bin would be maintained in a moist condition.

## 7.3 Human Health

A Human Health Risk Assessment (HHRA) was prepared to assess potential health risks to surrounding off-site human receptors resulting from exposure to air emissions associated with the Project. The HHRA considered both air emissions generated by the Project during typical operating conditions and the proposed maximum EPL limits (see **Table 21**).

The HHRA addressed the following assessment stages:

1. Issues Identification.
2. Hazard Identification.
3. Dose-Response Assessment.
4. Exposure Assessment.
5. Risk Characterisation.

**Chemicals of Potential Concern**

Chemicals of potential concern (CoPC) are those chemicals which are suspected to be emitted from the stacks at concentrations that may present a risk to human health. The prime objective of identifying CoPC is to focus the HHRA on assessing chemicals that have the potential to significantly contribute to risks to human health.

The CoPC considered part of this HHRA was sourced from the AQIA (AECOM 2018), which reported the results of air dispersion modelling for the following CoPCs:

- Antimony;
- Arsenic;
- Cadmium;
- Chromium;
- Lead;
- Manganese;
- Mercury;
- Nickel;

- Acetone;
- Benzene;
- Toluene;
- Cyanide;
- Dioxins and Furans; and
- Total PAHs as benzo(a)pyrene and naphthalene.

**Potential Off-Site Human Receptors**

The following human receptors were considered in the HHRA based on the surrounding land uses:

- Off-site residents, includes caravan parks;
- Off-site commercial workers; and
- Off-site recreational users.

**Exposure Pathways**

Pathways that have been considered to be complete for the Site and were assessed in the HHRA include:

- Inhalation of vapours and dust in indoor and outdoor air (inhalation pathway assessment);
- Ingestion of home-grown fruit and vegetables by residents (multiple exposure pathway assessment);
- Ingestion of home-grown beef (multiple exposure pathway assessment);
- Ingestion of eggs from home-grown chickens by residents (multiple exposure pathway assessment); and
- Ingestion of breastmilk by infants (multiple exposure pathway assessment).

A summary of the AQIA is provided below. The complete HHRA is provided at **Appendix F.**

### 7.3.1 Existing Environment

A Conceptual Site Model (CSM) is a site-specific qualitative description of the source(s) of contamination, the pathway(s) by which contaminants may migrate through the environmental media, and the populations (human or ecological) that may potentially be exposed. This relationship is commonly known as a Source-Pathway-Receptor (SPR) linkage. Where one or more elements of the SPR linkage are missing, the exposure pathway is considered to be incomplete and no further assessment is required.

The CSM for the Site has been prepared in accordance with Schedule B2, ASC NEPM (2013).

**Table 27 Potential Exposure Pathways**

| Exposure Pathway | Off-site Residents | Off-site Commercial Workers | Off-site Recreational User |
|---|---|---|---|
| **Vapour** | | | |
| Inhalation of stack-derived vapour in indoor air | ✓ | ✓ | ✓ |
| Inhalation of stack-derived vapour in outdoor air | ✓ | ✓ | ✓ |
| **Soil / Deposited Dust** | | | |
| Incidental Ingestion of surficial soils following dust deposition | ✓ | × (a) | × (c) |
| Dermal Contact with surficial soils following dust deposition | ✓ | × (a) | × (c) |

| Exposure Pathway | Off-site Residents | Off-site Commercial Workers | Off-site Recreational User |
|---|---|---|---|
| Ingestion of home-grown fruit and vegetables | ✓ | × (a) | × |
| Ingestion of eggs from home-grown chickens | ✓ | × (a) | × |
| Ingestion of home-grown beef | ✓ | × (a) | × |
| Ingestion of breastmilk | ✓ | × (b) | × (c) |

**Notes:** × – incomplete pathway
✓ – complete pathway

a. Based on the surrounding land use desktop inspection undertaken by AECOM, commercial properties were typically capped with hardstand and therefore soil is not exposed for direct contact. Additionally, these commercial properties were not used to grow home-grown produce.

b. The assessment of ingestion of breastmilk by a resident mother is considered to be protective of a commercial worker mother or a recreational user mother as the resident is exposed by more pathways and for longer periods of time.

c. The assessment of direct contact with soil for residential receptors is considered protective of recreational users and maintenance workers as the resident is exposed for longer periods of time.

### 7.3.2 Potential Impacts

**Scenario 1 (Normal Operational Conditions)**

Using maximum annual average exposure point concentrations (EPCs) and grid maximum EPCs, estimated conservative screening (upper-bound) Incremental Lifetime Cancer Risk (ILCR) estimates for off-site receptors considered in the inhalation and multiple pathway assessments were found to be below the adopted acceptable risk level of 1 x 10-5, and hazard indices were below the adopted acceptable hazard index of 1.0.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from vapour and particulates emitted from the Site were considered low and acceptable.

**Scenario 2 (Operational Conditions at Proposed Maximum EPL Limits)**

Using the maximum annual average EPCs estimated conservative screening (upper-bound) ILCR estimates for off-site receptors considered in the inhalation and multiple pathway assessments were found to be below the adopted acceptable risk level of 1 x 10-5, and hazard indices were below the adopted acceptable hazard index of 1.0.

Using the grid maximum EPCs estimated conservative screening (upper-bound) ILCR estimates for off-site residents considered in this multi-exposure parameter assessment for Scenario 2 were found to be below the adopted acceptable risk level of 1 x 10-5, and the hazard indices were marginally above the adopted acceptable hazard index of 1.0. However, this scenario is considered to be overly conservative (i.e. a resident exposed to the modelled maximum annual average concentration at the operational conditions for the proposed maximum EPL limits for all Chemicals of Potential Concern (CoPC), for 24 hours a day, 365 days a year for 30 years). Scenario 2 is representative of theoretical worst case impacts operating at licence limits and is unlikely to be realised. Additionally, the grid maximum location was identified approximately 80 metres (m) north-west of the Site, on land currently zoned as General Industrial and not as residential land.

Risk estimates were based on a number of conservative assumptions and were considered to overestimate actual risk to receptors, it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels. Overall the estimated health risks to off-site residents, recreational users and commercial workers from inhalation and residents from direct contact pathways under normal and proposed maximum licence limit operating conditions were considered low and acceptable.

### 7.3.3 Mitigation Measures

The environmental controls nominated in **Section 2.4** would be implemented during operation of the facility to minimise dust generated by the Project and capture and control fugitive emissions and are considered adequate to address potential risks to human health.

## 7.4 Traffic and Transport

### 7.4.1 Background

An EA was previously lodged in support of an increase in production capacity of the Tomago Aluminium smelter (DA 392/80 and DA 4908/90) (ENSR|AECOM, 2009) (2009 Tomago Aluminium EA). The 2009 Tomago Aluminium EA assessed the traffic and transport impacts associated with an increase in production capacity of the Tomago Aluminium smelter to a maximum of 575,000 tonnes per annum of aluminium.

The traffic impact assessment included as part of the 2009 Tomago Aluminium EA report indicated the existing raw material haulage route from Old Punt Road, via the Pacific Highway would continue to be used. However, an alternative route via Stockton Bridge and Williamtown was also identified to provide access to the Port of Newcastle and to be used in the event of extended delays or in case of accidents along the existing route.

The anticipated truck movements resulting from the proposed increase in production at the Tomago Aluminium smelter proposed as part of 2009 Tomago Aluminium EA are presented in **Table 28.**

**Table 28 Anticipated Daily Truck Movements at Tomago Aluminium Smelter by 2014**

| Tucking Type | Anticipated Total |
|---|---|
| Alumina truck | 213 |
| Coke truck | 39 |
| Aluminium truck | 202 |
| **Total** | **454** |

**Table 28** indicates that Tomago Aluminium smelter was expected to generate 454 truck movements per day as part of the proposed increase in production envisaged to be completed by 2014. It was concluded that the net increase in traffic resulting from increased production was not likely to impact upon the safety or operation of the existing road network. Furthermore, it was noted that the recent upgrade and signalisation of the Old Punt Road and Pacific Highway intersection would adequately accommodate any additional truck turning movements and improve road safety at the intersection. The earlier traffic impact assessment was reviewed in detail to understand the requirements of an additional traffic study for the Project.

### 7.4.2 Existing Environment

The current operation of the Regain facility requires trucks for the delivery of SPL materials to the site, and the transfer of the recycled product material to its various destinations at brick and cement industries. The current operation of the facility is associated with 30 truck movements per week. The existing operation also accepts internal, deliveries of SPL material from the Tomago smelter which does not involve truck movements on the public road network. Passenger vehicles access the facility via the smelter's main entry off Tomago Road and use the existing TAC car park located near the main entrance.

**Route Selection**

Route selection is particularly important in this case as the raw material for the facility is a dangerous good. This study has identified routes and included ranking for each based on the guidelines present in *Hazardous Industry Planning Advisory Paper No 11: Route Selection*. The general factors that are considered for evaluating potential routes include traffic and roads, environmental and land use safety and transport economics. Not that full consideration of other hazards associated with the operation of the Project are provide in **Section 7.2**.There are specific mandatory considerations such as physical processes that need to be assessed during route selection. These are summarised as follows:

- **Definition of the transport area:** It is required from a traffic perspective and should include the identification of the road network through which traffic generated by the Project may traverse. Section on *Traffic Volumes* provides the expected traffic volumes likely to be generated by the capacity augmentation of the facility. It indicates that the Project will only result in a minor

increase of traffic and therefore is not expected to cause a significant effect on the transport network.

- **Identification of hazardous materials, source and destination:** is required to allow specific risk calculations to be carried out. Volume of traffic for the various types of hazardous materials is also required. A source of SPL for the facility, apart from TAC, is expected to be Kurri Kurri Hydro Aluminium located in Loxford, NSW and the remaining is anticipated to come using containerised freight via rail through Pacific National Rail Terminal, Carrington, NSW and through the Port of Newcastle. It may be noted that the processed product in this case is not a dangerous good and therefore these considerations do not apply for the outgoing materials from the facility.
- **Identification of the preferred hazardous goods route:** This step involves identification of the preferred transport routes over alternatives. The existing transport routes to the Regain facility have been considered as the primary haulage route for the incoming raw materials and an alternative route from the Port of Newcastle has also been identified. In addition to this, potential routes for hauling raw materials from Pacific National Rail Terminal, Carrington and Rail terminal at Sandgate have also been reviewed.
- **Comparison and ranking of potential routes:** This involves a comparison of each potential route and rating relative strengths and weaknesses, against each of the main factors. The primary and alternative route is then ranked for comparison.
- **Selection of suitable routes:** Suitable routes need to be selected based on a balanced judgement taking into account both the qualitative and quantitative results of their comparison. Based on comparison and ranking, the most suitable route is identified.
- **Identification of risk management measures:** It includes opportunities for risk reduction where the evaluation shows undesirable levels of risk along the preferred routes. The potential routes under consideration have been identified to have acceptable levels of risk. Therefore, no risk management measures are required for the identified routes.

A source of SPL for the facility is expected to be Kurri Kurri Hydro Aluminium located in Loxford, NSW and the remaining is anticipated to come using containerised freight via the Sandgate NSW and Carrington, NSW rail terminals and through the Port of Newcastle. The potential routes for the delivery of raw materials from these key sources are presented in **Table 29.**

**Table 29 Potential Haul Routes from Primary Origin Sources**

| Source Location | Route ID | Potential Haulage Routes |
|---|---|---|
| Kurri Kurri Hydro Aluminium (Source A) | Route A1 | Hunter Expressway>John Renshaw Drive>New England Highway>Pacific Highway>Old Punt Road |
| | Route A2 | Hunter Expressway>Pacific Motorway>John Renshaw Drive>New England Highway>Pacific Highway>Old Punt Road |
| | Route A3 | Hunter Expressway>Main Road>Cessnock Road>Les Darcy Drive> New England Highway>Pacific Highway>Old Punt Road |
| Port of Newcastle (Source B) | Route B1 | Cormorant Road>Tourle Street>Industrial Drive>Maitland Road>Pacific Highway>Old Punt Road |
| | Route B2 | Nelson Bay Road>Cabbage Tree Road>Tomago Road>Old Punt Road |
| Rail Terminal, Carrington, NSW (Source C) | Route C1 | Selwyn Street>George Street>Industrial Drive>Maitland road>Pacific Highway>Old Punt Road |
| | Route C2 | Selwyn Street>Pacific Highway>Hubbard St>Chinchen St>Clyde St>Christo Rd>Griffiths Rd>Main Rd>Maitland Rd>Pacific Highway>Old Punt Road |
| Rail Terminal, Sandgate, NSW (Source D) | Route D1 | Old Maitland Rd>Maitland Road>Pacific Highway>Old Punt Road |

Based on the potential haul routes identified in **Table 29,** each route was ranked based on the parameters that need to be considered during route selection for transport of hazardous materials. In order to rank the routes, a five-point scale was adopted with 5 being the most preferred and 1 being the least preferred. To ensure proper weighted values for each parameter, weights of 5 and 10 were assigned to each as indicated in **Table 30.**

**Table 30 Ranking of Potential Haulage Routes**

| Route ID | Road Hierarchy (Wt.5) | Travel Speed (Wt.5) | Land Use (Wt.10) | Transport Costs (Wt.10) | Weighted Ranking |
|---|---|---|---|---|---|
| Route A1 | 4.5 | 4 | 4.5 | 5 | 137.5 |
| Route A2 | 5 | 4 | 5 | 3.5 | 130 |
| Route A3 | 3 | 3 | 3 | 4 | 100 |
| Route B1 | 4 | 3 | 3 | 5 | 115 |
| Route B2 | 3 | 2.5 | 4 | 4 | 107.5 |
| Route C1 | 4 | 3 | 4 | 4 | 115 |
| Route C2 | 2.5 | 2.5 | 2.5 | 2 | 70 |
| Route D1 | 4 | 3.5 | 4 | 4 | 117.5 |

The preferred routes from the key sources of origin are Route A1, Route B1, Route C1 and Route D1. Therefore, the facility is expected to use Route A1, B1, C1 and D1 for incoming raw materials. These routes form part of the existing haul routes to the existing Regain facility and Tomago smelter.

The primary haul route that will be used for delivery of raw materials and transport of product primarily includes the following public roads:

- Pacific Highway;
- New England Highway;
- Hunter Expressway;
- John Renshaw Drive.
- M1 Pacific Motorway;
- Maitland Road;
- Industrial Drive;
- Tourle Street Bridge and;
- Cormorant Road.

The Regain facility is accessed via Old Punt Road, off the Pacific Highway. A private road links the TAC smelter site with Old Punt Road. Internal access roads are used to access the Regain facility.

The Pacific Highway provides connectivity to the Port of Newcastle or the M1 (Pacific Motorway) which enables the import of SPL materials for treatment and distribution of Regain products to customers. It may be noted that the processed material is not a dangerous good and therefore guidelines related to transport of dangerous goods do not apply to the distribution of processed materials. Details of the type of processed products are available in the previous sections for reference. A description of each of the roads used in the existing haulage route is provided in **Table 31** below. The primary access route for raw materials is shown in **Figure 10** considering the key sources of raw materials.

**Table 31 Description of roads used in haulage route**

| Road | Description |
|---|---|
| Old Punt Road | Old Punt Road is a two-lane road which connects to the Pacific Highway from the east through an all movement intersection. Old Punt Road connects to a private road which links to the Tomago Aluminium smelter.<br>The intersection of Old Punt Road and the Pacific Highway was upgraded to improve traffic conditions. The upgrades included installing traffic control signals; providing an improved left-turn lane from Old Punt Road to the Pacific Highway; and lengthening the merge lane on the Pacific Highway from Old Punt Road. |
| Pacific Highway | The Pacific Highway is a major transport route which links Sydney and Brisbane along the eastern coast of Australia. The section of the Pacific Highway near the Tomago Aluminium smelter has 2 lanes in each direction. The Hexham Bridge carries the Pacific Highway over the Hunter River and has 2 lanes in the southbound direction and 3 lanes in the northbound direction. It is also an RMS designated B-double route. |
| Hunter Expressway | Hunter Expressway (M15) is an expressway with 2 lanes in each direction across a divided carriageway. The speed limit on this road is 110 km/hr. It connects Newcastle link road with New England Highway. It is also an RMS designated B-double route. |
| John Renshaw Drive | John Renshaw Drive (B86) connects New England Highway with Hunter Expressway and continues into Kurri Kurri area. It is a two-lane undivided road that is an RMS designated B-double route. John Renshaw Drive has a speed limit of 100km/hr in either direction and reduces to 60km/hr near exits and intersections. |
| New England Highway | The New England Highway forms part of the National Land Transport Network and is a major freight and commuter route between Newcastle and the Upper Hunter. The section of the New England Highway in the vicinity of the TAC smelter has 2 lanes in each direction. The New England Highway provides connectivity to the M1 Motorway via John Renshaw Drive. It is also an RMS designated B-double route. |
| Industrial Drive | Industrial Drive is met by Tourle Street at an all movement intersection. The road is approximately 5.5km in length and is a two-lane dual carriageway. It is also an RMS designated B-double route. |
| Tourle Street | Tourle Street is the continuation of Cormorant Road over the southern arm of the Hunter River to the southern mainland. Tourle Street provides a direct route between Newcastle, the industrial area and Newcastle Port facilities on Kooragang Island. The 1km sealed bridge consists of one lane in each direction. Tourle Street has a speed limit of 60km/hr in either direction. It is also an RMS designated B-double route. |
| Cormorant Road | Cormorant Road is located on Kooragang Island, which is the site of a deep-water port for the export of coal, and a major heavy industrial area in Newcastle. Cormorant Road is a sealed road that predominantly consists of one lane in each direction. The eastern section of the road widens into a duel carriageway in each direction. There is a speed limit of 60km/hr in the westbound direction and 80km/hr in the eastbound direction. It is also an RMS designated B-double route. |

The roads used in the haulage route are all designated B-double routes and therefore it is imperative that they have all been designed to ensure safe movement of large trucks. The primary egress routes for the processed material are shown in **Figure 11**. It may be noted that the processed material is not a dangerous good and therefore transport of the processed goods from the augmented facility does not require considerations related to transport of dangerous goods.

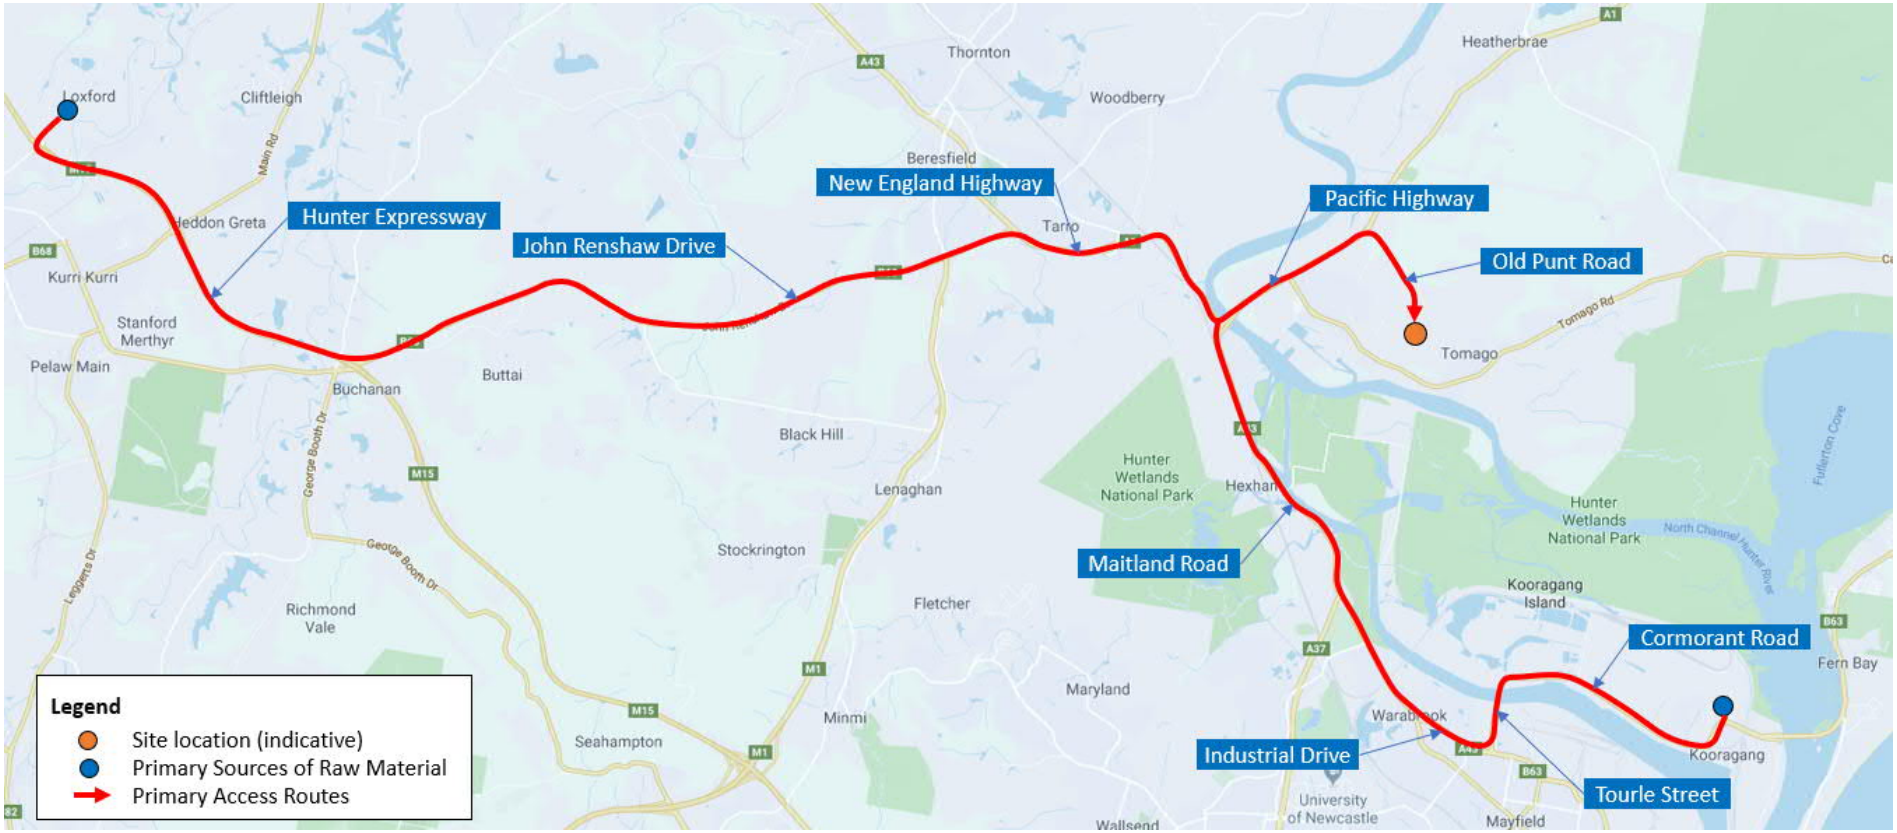

**Figure 10 Primary Access Route for Raw Materials**

**Figure 11 Primary Egress Route for Processed Products**

An alternative haulage route is also available from the Port of Newcastle, and a description of the proposed roads is provided in **Table 32.** This route is also an RMS designated B-double route. This alternative transport route would be used for the transfer of raw materials between the Port of Newcastle and the smelter. The alternative haulage route is proposed for use only in case of an unforeseen event, such as a road closure or accident on the existing approved route.

The alternative route through Stockton Bridge will be via the following roads:

- Cormorant Road;
- Teal Street;
- Stockton Bridge;
- Nelson Bay Road;
- Cabbage Tree Road; and
- Tomago Road.

The proposed alternative route is classified as a B-double route and is therefore suitable for use during an emergency. The primary route for the incoming raw materials and outgoing finished products will be through Pacific Highway and Old Punt Road.

**Table 32 Description of roads which might be used as an alternative route**

| Road | Description |
|---|---|
| Cormorant Road | Cormorant Road is located on Kooragang Island, which is the site of a deep-water port for the export of a variety of commodities, primarily coal, and a major heavy industrial area in Newcastle. Cormorant Road is a sealed road that predominantly consists of one lane in each direction. The eastern section of the road widens into a dual carriageway in each direction. There is a speed limit of 60km/hr in the westbound direction and 80km/hr in the eastbound direction. |
| Teal Street | Teal Street is located on the eastern side of Kooragang Island and is a dual carriageway for its length in each direction and is connected to Cormorant Road by a roundabout. Teal Street is a four-lane divided classified road (MR108) providing a connection to the north eastern suburbs such as Fern Bay. Teale Street is the main east-west connection in Kooragang Island. It provides access to the Stockton Bridge and there is a speed limit of 80km/hr in both directions. |
| Stockton Bridge | Stockton Bridge is the continuation of Teal Street and turns into Nelson Bay Road on the eastern side of the Hunter River. The road is a dual carriageway in both directions. |
| Nelson Bay Road | Nelson Bay Road is the continuation of Teal Street over the Stockton Bridge. It is a major north south route, providing access from Nelson Bay through to Newcastle CBD via Kooragang Island. It is a key strategic freight route providing road access to Newcastle Airport. From Teal Street to the Bayway Village, Nelson Bay Road is a four-lane divided classified road (MR108) signed at 80km/h in both directions. From Bayway Village to the north east of the Port of Newcastle, Nelson Bay Road is predominantly a two-lane undivided road signposted at 70km/h in both directions of travel. |
| Cabbage Tree Road | Cabbage Tree Road is a single lane carriageway in each direction with a speed limit that varies between 60km/hr to 90km/hr. It connects the Nelson Bay Road with Tomago Road. |
| Tomago Road | Tomago Road is a continuation of Cabbage Tree Road and is also a single lane carriageway in each direction. The road has a speed limit that varies between 80km/hr and 90km/hr. |

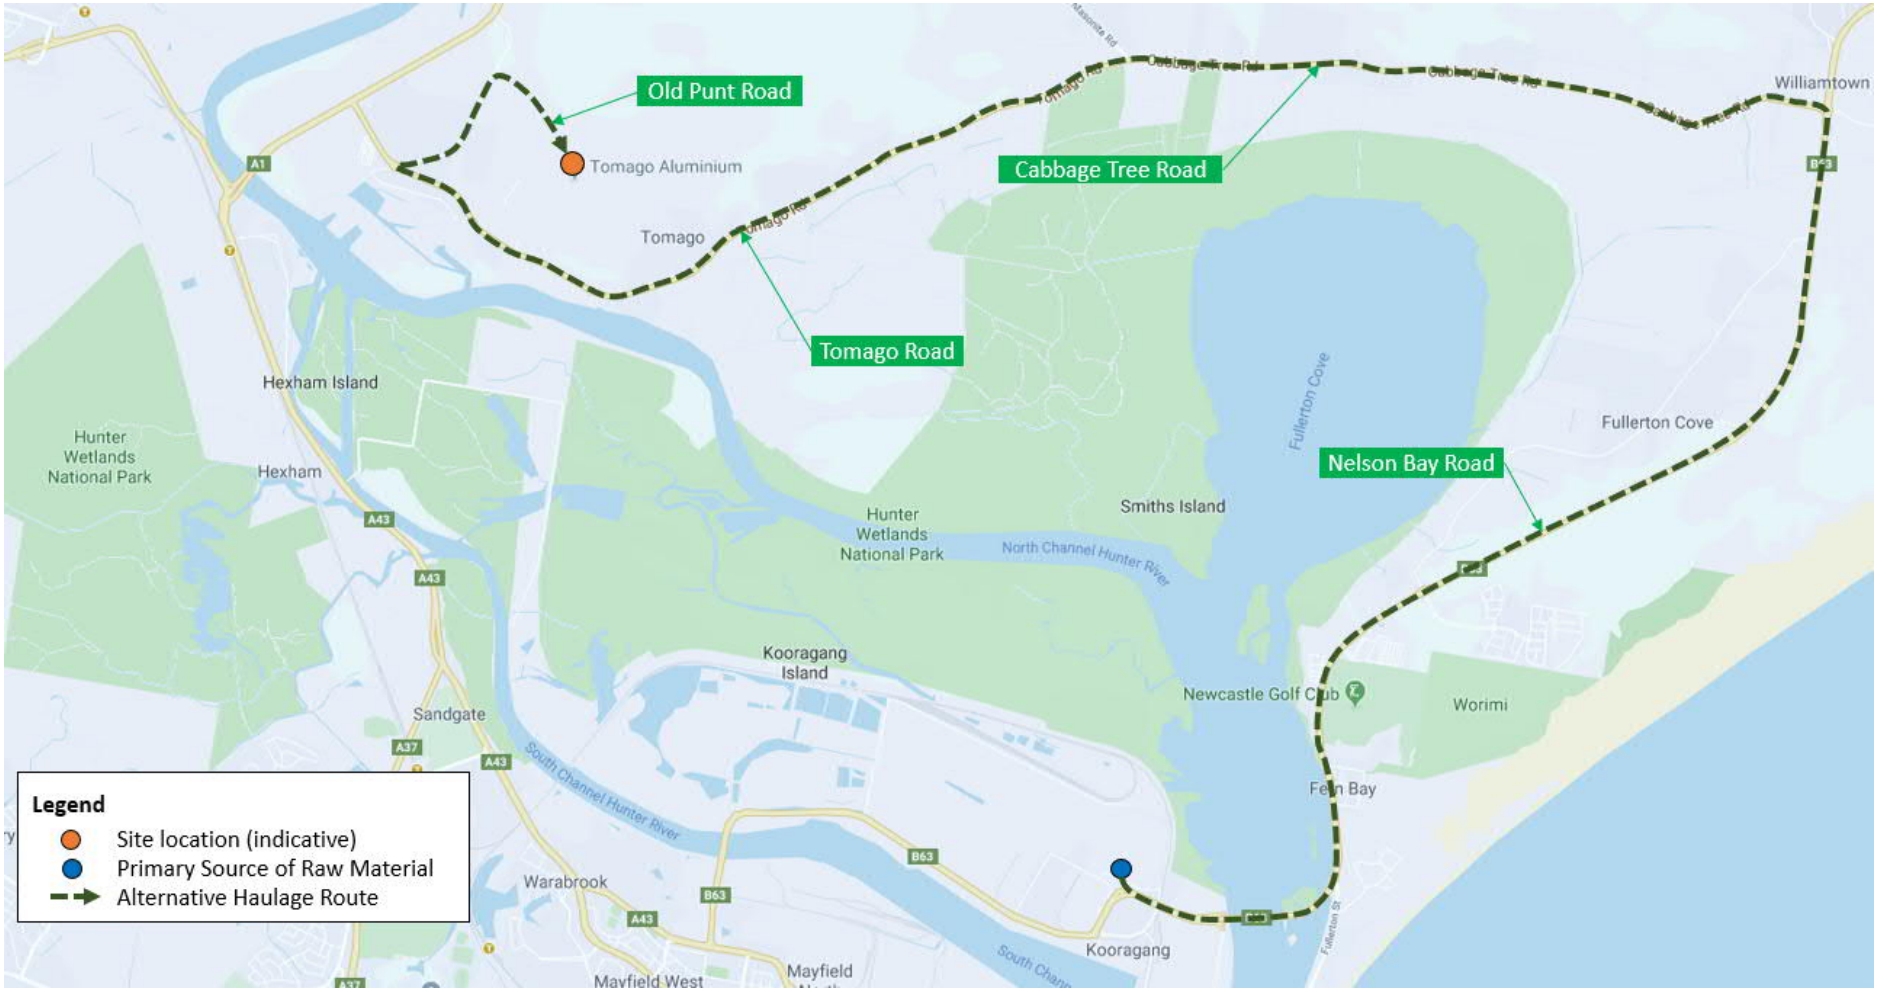

**Figure 12 Alternative Haulage Route**

### Traffic Volumes

Old Punt Road provides access to vehicles travelling to and from both the Regain facility and TAC aluminium smelter. Daily truck movements associated with operation of the TAC smelter were estimated at 418 truck movements per day in 2009 (ENSR|AECOM, 2009). Conservative estimates of 454 truck movements per day were identified within an Environmental Assessment lodged in support of an increase in production capacity of the TAC smelter (DA 392/80 and DA 4908/90) (ENSR|AECOM, 2009). However daily truck movements associated with operation of the TAC smelter were estimated at 134 based on truck movements to the TAC smelter in July 2016 (TAC, 2016).

Truck movements were estimated at 30 movements per week for the Regain facility in the 2009 EA (based on the Project configuration as proposed at the time). Truck movements associated with the TAC smelter were estimated at 1140 truck movements per week in the 2009 EA.

The daily total truck movements observed during the operations of Tomago Aluminium smelter in 2016 were significantly lower when compared to the truck movements predicted in the 2009 Tomago Aluminium EA. A comparison between the predicted and observed truck movements are presented in **Table 33.**

**Table 33 Comparison of estimated and predicted truck movements generated by Tomago Aluminium smelter**

| Source Data | Truck Movements (per day) |
|---|---|
| Overall truck movements from Tomago Aluminium smelter estimated as part of 2009 EA Report | 454 |
| Observed truck movements from Tomago Aluminium Smelter (Tomago Aluminium, 2016) | 134 |
| Difference | -70.5% |

Traffic count data is available from the NSW Roads and Maritime Services (RMS) database for the Pacific Highway and is collected by a permanent traffic counter installed approximately 380m west of Tomago Road. Traffic count data is also available on Tourle Street, 310m east of McIntosh Drive and is collected by permanent traffic counter. These locations are shown in **Figure 13** and the traffic data is summarised in **Table 34.**

**Table 34 Historical traffic counts (RMS, 2018)**

| Location | Direction | 2012 | 2013 | 2014 | 2015 | 2016 | Average % Growth per year |
|---|---|---|---|---|---|---|---|
| Pacific Highway | Northbound | 21,560 | 21,701 | 20,791 | 23,404 | 23,930 | + 2.6% |
| | Southbound | 21,249 | 21,291 | 21,834 | 23,938 | 23,475 | + 2.5% |
| | **Total** | **42,809** | **42,992** | **42,625** | **47,342** | **47,405** | **+ 2.6%** |
| Tourle Street | Northbound | 14,062 | 13,815 | 13,505 | 13,636 | - | - 1.0% |
| | Southbound | 14,005 | 13,835 | 13,575 | 13,774 | - | - 0.6% |
| | **Total** | **28,067** | **27,650** | **27,080** | **27,410** | - | - 0.8% |

Source: RMS Traffic Count Database

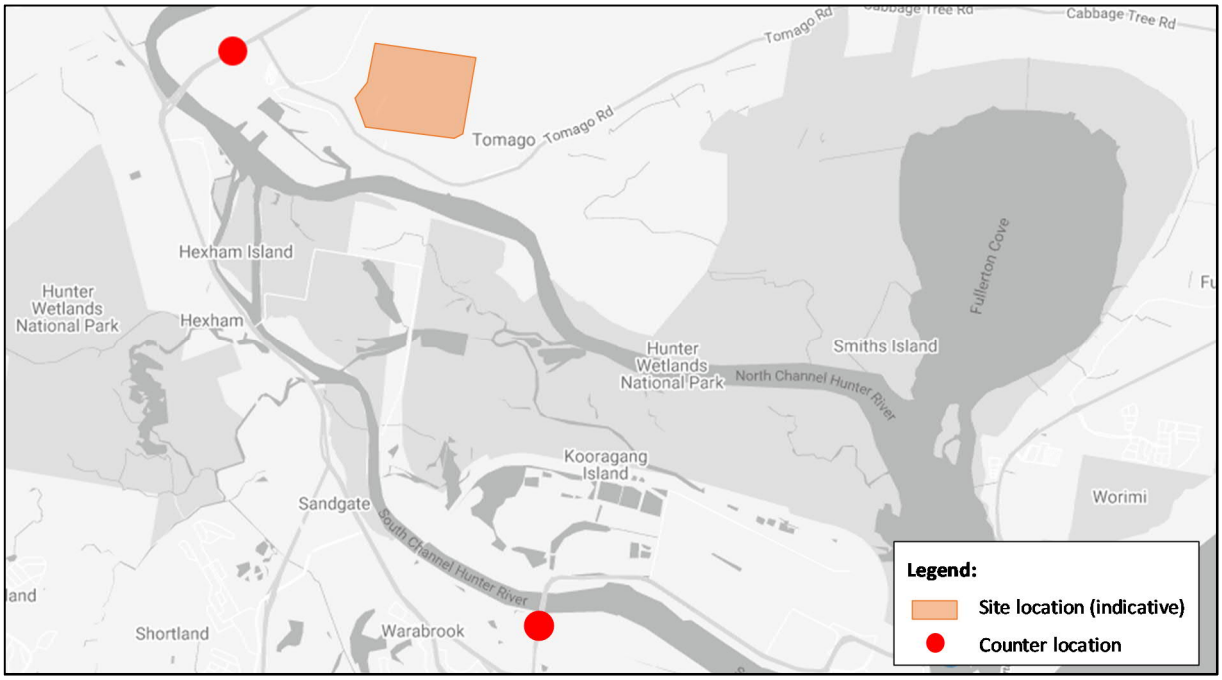

**Figure 13 Location of traffic count collectors**

Using the growth rates identified in **Table 34,** existing (2018) and future (2023) Average Annual Daily Traffic (AADT) data has been calculated for the roads and is shown in **Table 35.**

**Table 35 Existing and Future Traffic Volumes**

| Road | Location | Available Counts | % growth per year | 2018 | 2023 |
|---|---|---|---|---|---|
| Pacific Highway | 380m west of Tomago Road | 47,405 (2016) | +2.6% | 49,902 | 56,735 |
| Tourle Street | 310m east of McIntosh Drive | 27,410 (2015) | +1.0%* | 28,409 | 30,155 |

* Assumed to increase at 1% due to proposed infrastructure upgrades

RMS data available online for the peak hour volumes and directional distribution for the previous years was used to estimate the likely peak hour traffic volumes along these corridors.

The predicted peak hour traffic in year 2023 and the likely volume capacity ratio (V/C) is presented in **Table 36**. There is sufficient additional capacity to handle the estimated future increases in traffic along these corridors.

**Table 36 Future Mid-Block Assessment (2023)**

| Road | Location | Capacity veh/hr | Peak Hour Volume Factor | Average Critical Peak Hour Traffic (2023) | V/C |
|---|---|---|---|---|---|
| Pacific Highway | West of Tomago Road | 3,800 | 8.2% | 2,329 | 0.61 |
| Tourle Street | East of McIntosh Drive | 3,000 | 8.4% | 1,262 | 0.42 |

The performance of two key intersections along the Industrial Drive is presented in **Table 37**. The intersections currently operate at acceptable levels of service (LOS). The locations of these intersections are presented in **Table 14.**

**Table 37 Intersection LOS of Key Junctions along Industrial Drive (Source: AECOM, 2017)**

| Intersection | Year | Vehicles per Hour | V/C | Avg. Delay | LOS |
|---|---|---|---|---|---|
| Tourle Street / Industrial Drive* | 2016 | 5,460 | 1.02 | 44.10 | D |
| Werribi Street / Industrial Drive | 2016 | 4,116 | 0.852 | 19.10 | B |

*The performance assessment was based on previous junction configuration. Intersection performance is expected to improve significantly after the proposed *Duplication of Tourle Street / Cormorant Road* is complete.

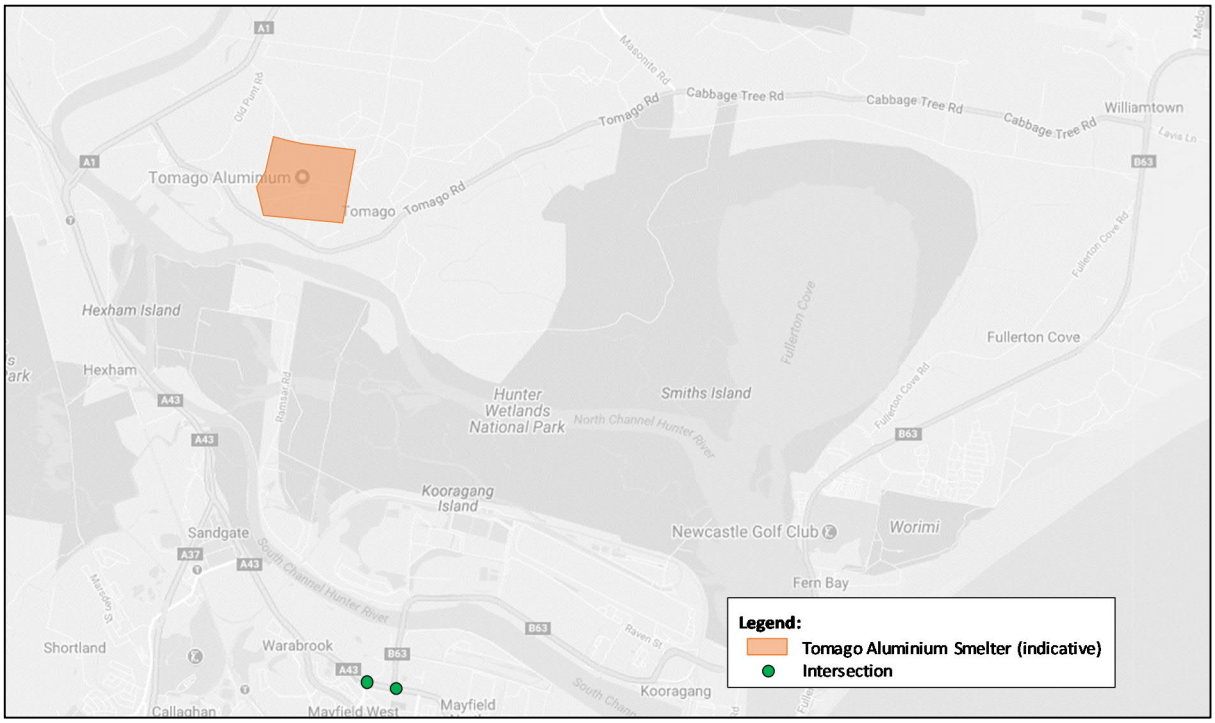

**Figure 14 Key Junctions along Industrial Drive**

### 7.4.3 Potential Impacts

#### Potential construction traffic impacts

During construction there would be a minor and temporary increase in heavy and light vehicles accessing the site via the Tomago Aluminium smelter site. Traffic generated during construction would be similar to that assessed in the 2009 EA, which included 12 over-dimension and 35 standard semi-trailer deliveries accessing the site throughout the eight to ten month construction period. There would be approximately 5 to 10 additional light vehicles accessing the facility during the construction period. This represents a minimal increase in traffic volumes and is expected to result in negligible impacts to the existing traffic network.

Standard safety protocols would be followed during the construction period to ensure that construction traffic would have minimal impact on the safety and capacity of the surrounding road network. To reduce the potential impacts of construction traffic, all construction contractors would be required to follow the existing Regain and Tomago site traffic management measures to ensure safety and minimise potential impacts to traffic flow on the surrounding road network.

Based on the number of construction traffic movements, past intersection upgrades carried out by the RMS, and the proposed traffic management measures outlined above, the construction of the Project is not anticipated to have a significant impact on the safety or capacity of the existing road network.

### Potential operational traffic impacts

*Increased traffic movements*

Estimated truck movements established based on a conservative approach is shown in **Table 38.** These estimates consider variability in truck size, loads and existing site practice of batching product deliveries. It is considered that these estimates likely overestimate truck movements generated by the Project during typical operation of the Regain facility and may therefore be considered a worst case estimate.

**Table 38 SPL Facility Anticipated Increase in Truck Movements**

| | Additional Movements Per Week (in/out) [1] | Additional Movements Per Day (in/out) | Additional Movements during Peak Hour (in/out) [2] |
|---|---|---|---|
| Total truck movements | 90 | 13[3] | 13[3] |
| Inbound | 45 | 6 | 6 |
| Outbound | 45 | 6 | 6 |

[1] An in:out split of 50:50 is assumed.
[2] It is assumed that the daily truck movements may occur during the peak hour.
[3] This is a rounded estimate.

The conservative estimates in **Table 38** indicate that the Project would potentially generate up to 13 two-way movements during the peak hour in the most conservative scenario. The total future truck traffic likely to be generated by the Project and the Tomago Aluminium smelter site is provided in **Table 39**. The additional truck traffic generated by the Project is expected to result in a 3% increase in the total traffic movements from the Tomago Aluminium smelter site.

**Table 39 Traffic movements**

| Scenario | Truck Movements Per Day |
|---|---|
| Existing Tomago Aluminium Facility as per 2009 Tomago Aluminium EA. | 454 |
| Additional traffic from the Project | 13 |
| Total Truck Traffic | 471 |
| % Increase | 3% |

*Assessment of potential impacts to the road network*

The Project is estimated to result in an additional 90 truck movements per week compared to the existing 30 truck movements per week. Therefore, it is estimated that the Project would generate a total of 120 truck movements per week.

**Table 40** shows the additional truck movements as a proportion of the existing AADT along the roads of the haulage route.

**Table 40 Additional Truck Movements as a proportion of existing AADT**

| Road | Existing AADT (2018) | Additional weekly movements | Additional daily movements | % of Existing Traffic |
|---|---|---|---|---|
| Pacific Highway | 49,902 | 90 | 13 | 0.03% |
| Tourle Street | 28,409 | 90 | 13 | 0.05% |

**Table 40** shows that the additional truck movements would comprise no more than 0.05% of the existing traffic on the key roads along the existing haulage route. There would be no additional passenger vehicle movements associated with operation of the modified facility, as the existing workforce is not expected to change.

The RMS Guide to Traffic Generating Developments includes a schedule of consultation and points of referral for any development. An industrial development that is of a scale less than those on Schedules 1 and 2 of the RMS Guide does not require RMS consultation. The 13 additional movements per day is less than is shown on Schedules 1 and 2 and is therefore considered to have negligible impact.

Considering the low traffic volumes generated by the Project (13 two-way movements per day), the Project is expected to have limited impact on the overall intersection performance and would not result in a change to intersection level of service performance or mid-block capacity performance.

Access and amenity of surrounding uses is unlikely to be impacted by increased traffic volumes. The facility would not require any change to car parking at the site as the existing car park complies with relevant guidelines and standards.

**Infrastructure Upgrades**

The 2009 Tomago Aluminium EA noted that improvement works had recently been completed by RMS at the intersections of Old Punt Road / Pacific Highway and Tomago Road / Pacific Highway. Traffic control signals and other traffic improvements were installed at both intersections to improve safety for road users. These intersections are considered to be suitable for use by heavy vehicles and include dedicated acceleration and deceleration lanes. The minor increase in traffic volumes generated by the Project would not change the level of service of these intersections or impact road safety during construction or operation. Current layouts of these two intersections have been presented in **Figure 15** and **Figure 16.**

Heavy vehicles for the Project would travel on public roads along the same haul route currently accessed by existing trucks travelling to and from the facility. Given the existing traffic volumes using the road network between the Tomago Aluminium facility, the Port of Newcastle, and other main delivery destinations, the increase in traffic load is considered to be minimal. The 2009 EA concluded that all intersections provide adequate geometric layouts to cater for heavy vehicles.

The intersection of Pacific Highway/ Old Punt Road is a 3-leg signalised intersection. A westbound slip lane is provided from Old Punt Road into Pacific Highway. Pacific Highway is generally two-lanes in each direction with a 215m deceleration lane and a 130m acceleration lane on the western leg and a 120m acceleration lane with an 85m deceleration lane on the eastern leg. The intersection layout highlighting the lengths of acceleration and deceleration lanes is presented in **Figure 15.**

**Figure 15 The intersection of Old Punt Road / Pacific Highway**

The intersection of Pacific Highway/ Tomago Road is a 3-leg signalised intersection permitting left turns only from Tomago Road into Pacific Highway. The Pacific Highway includes two lanes in each direction and two 215m deceleration lanes from the west and a 135m acceleration lane from the east. Tomago Road is generally one lane in each direction with 140m deceleration lane and a 120m acceleration lane. The intersection layout highlighting the lengths of acceleration and deceleration lanes is presented in **Figure 16** .

**Figure 16 The intersection of Tomago Road / Pacific Highway**

### Future Infrastructure Upgrades

There are also other infrastructure upgrades proposed along the haulage route as indicated in a study for the Port of Newcastle Port – Strategy Road Transport and Traffic Assessment (AECOM, 2017). Whilst the Project has been demonstrated to be able to operate with minimal impact upgrades identified in this study would alleviate congestion related to background traffic growth.

#### 1. M1 Pacific Motorway Extension to Raymond Terrace

RMS is currently investigating the extension of the motorway from the M1 Pacific Motorway at Black Hill to the A1 Pacific Highway at Raymond Terrace since 2004. The Project involves building about 15 kilometres of four-lane divided road that will bypass Beresfield, Tarro, Hexham, Tomago and Heatherbrae. The extension would connect the M1 directly to the A1 northbound, which is the strategic road corridor to Brisbane, and aims to alleviate congestion caused by vehicles leaving the M1 to join the A1 at the roundabout intersection with John Renshaw Drive. The new motorway would significantly reduce traffic congestion on existing connections (i.e. New England Highway and Pacific Highway).

These improvements would further reduce the number of vehicles reaching the intersections at Tomago Road and Old Punt Road, thereby resulting in significant improvements on the levels of service and safety. The proposed upgrade in the vicinity of the site is presented in **Figure 17.**

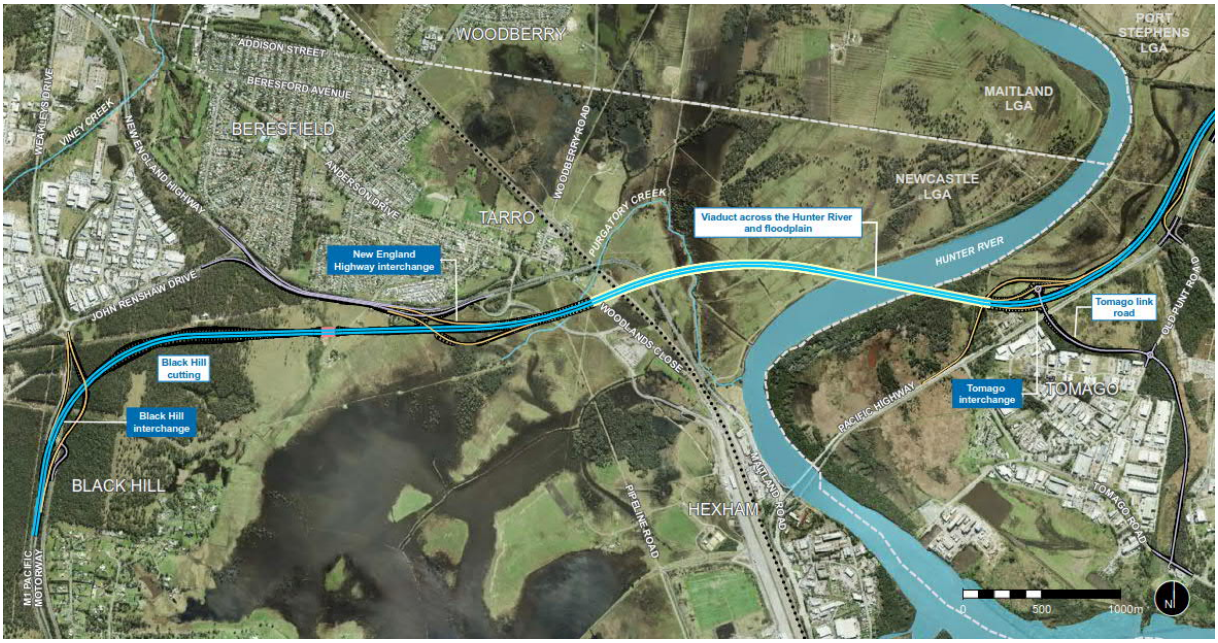

**Figure 17 Proposed M1 Pacific Motorway to Raymond Terrace Alignment**

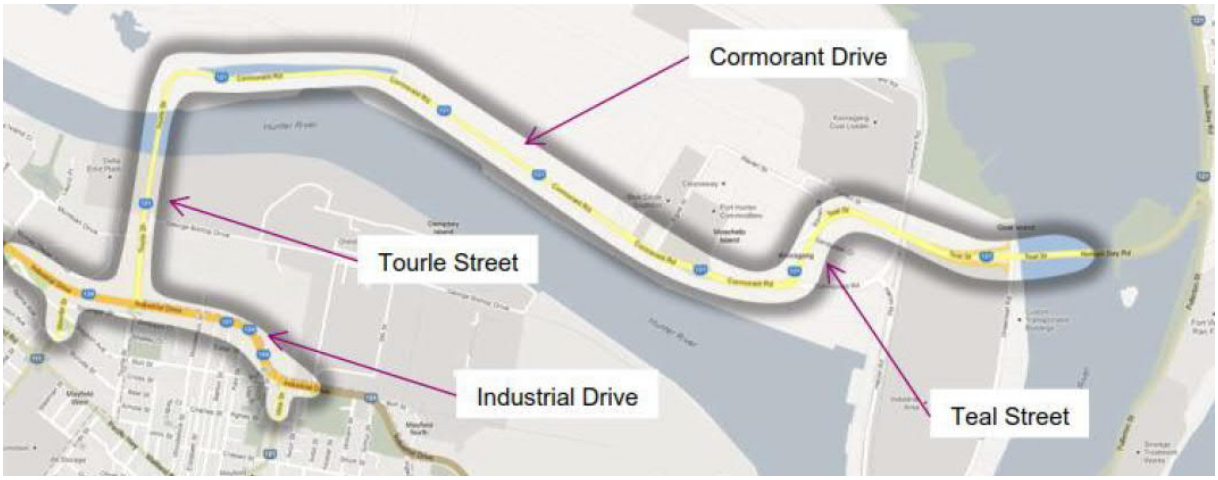
#### 2. Kooragang – Duplication of Tourle Street / Cormorant Road

Tourle Street and Cormorant Road, located on Kooragang Island, provide an important connection between Newcastle and Port Stephens that serves as a strategic commercial link for the various developments adjacent to these areas. To maintain this connection, RMS has investigated both short term and long-term improvements for the corridor that include the resurfacing and widening of the shoulders along the parts of Cormorant Road and extending the westbound merge sections on Cormorant Road, which was completed in July 2012. The long-term plan for the route is to duplicate the existing two lanes and develop a dual carriageway (four lanes in total) and thereby improve efficiency and safety along the corridor by removing the westbound merge.

The duplication of Tourle Street and Cormorant Road was completed in mid-2018. This additional link provides sufficient capacity for the 2040 future design year and helps to improve travel times. The augmentation of this section of the road improves operational performance of the corridor. The proposed upgrades are presented in **Figure 18.**



Source: AECOM, 2017

**Figure 18 Duplication of Tourle Street / Cormorant Road**

### Traffic Route Selection

A vehicle swept path analysis has been undertaken in accordance with the Austroads B-Double standard (25m) to confirm adequate space within the existing operation areas to accommodate truck loading and delivery activities (see **Figure 19**). The analysis is considered conservative as in reality trucks have been demonstrated to achieve tighter turn radii on site. The analysis confirms that no change in existing access arrangements are required as part of the modification.

5-Year crash data provided by the RMS for intersections surrounding the Tomago Aluminium site in the Port Stephens LGA were reviewed to inform this review. Crashes reviewed occurred in the 2013 to 2017 period inclusive. RMS data includes information such as the worst degree of crash injury, number of casualties, crash descriptions via the Road User Movement (RUM) codes, natural lighting conditions and location type.

Data was gathered for three intersections:

1. Pacific Highway | Old Punt Road (Intersection 1);
2. Pacific Highway | Tomago Road (Intersection 2); and
3. Tomago Road | Tomago Aluminium Access Road (Intersection 3).

Key observations for each intersection are provided below:

- Intersection 1 had 7 crashes, 6 of which were casualty crashes (1 fatal) and 1 was non-casualty tow-away;
- Intersection 2 had 17 crashes, 11 of which were casualty crashes (1 fatal) and 6 were non-casualty tow-away; and
- Intersection 3 had 1 serious injury crash.

The crash volumes at Intersections 1 and 2 are considered non-negligible, for reference 3 casualty crashes in 5 years is the minimum criteria for an intersection to be considered for treatment under the federal ‘Black Spot’ program.

Given Intersections 1 and 2 have been provided with substantial treatment, such as acceleration and deceleration lanes for all minor road movements and signalisation, the number of crashes is considered likely to relate to the substantial traffic volumes on the Pacific Highway rather than a specific site design flaw of these intersections.

A motorway extension from the M1 Pacific Motorway at Black Hill to the A1 Pacific Highway at Raymond Terrace is also currently under consideration by Roads and Maritime. These upgrades would significantly improve the operational traffic safety at these intersections if they are approved and constructed. Further details regarding this upgrade have been included above.

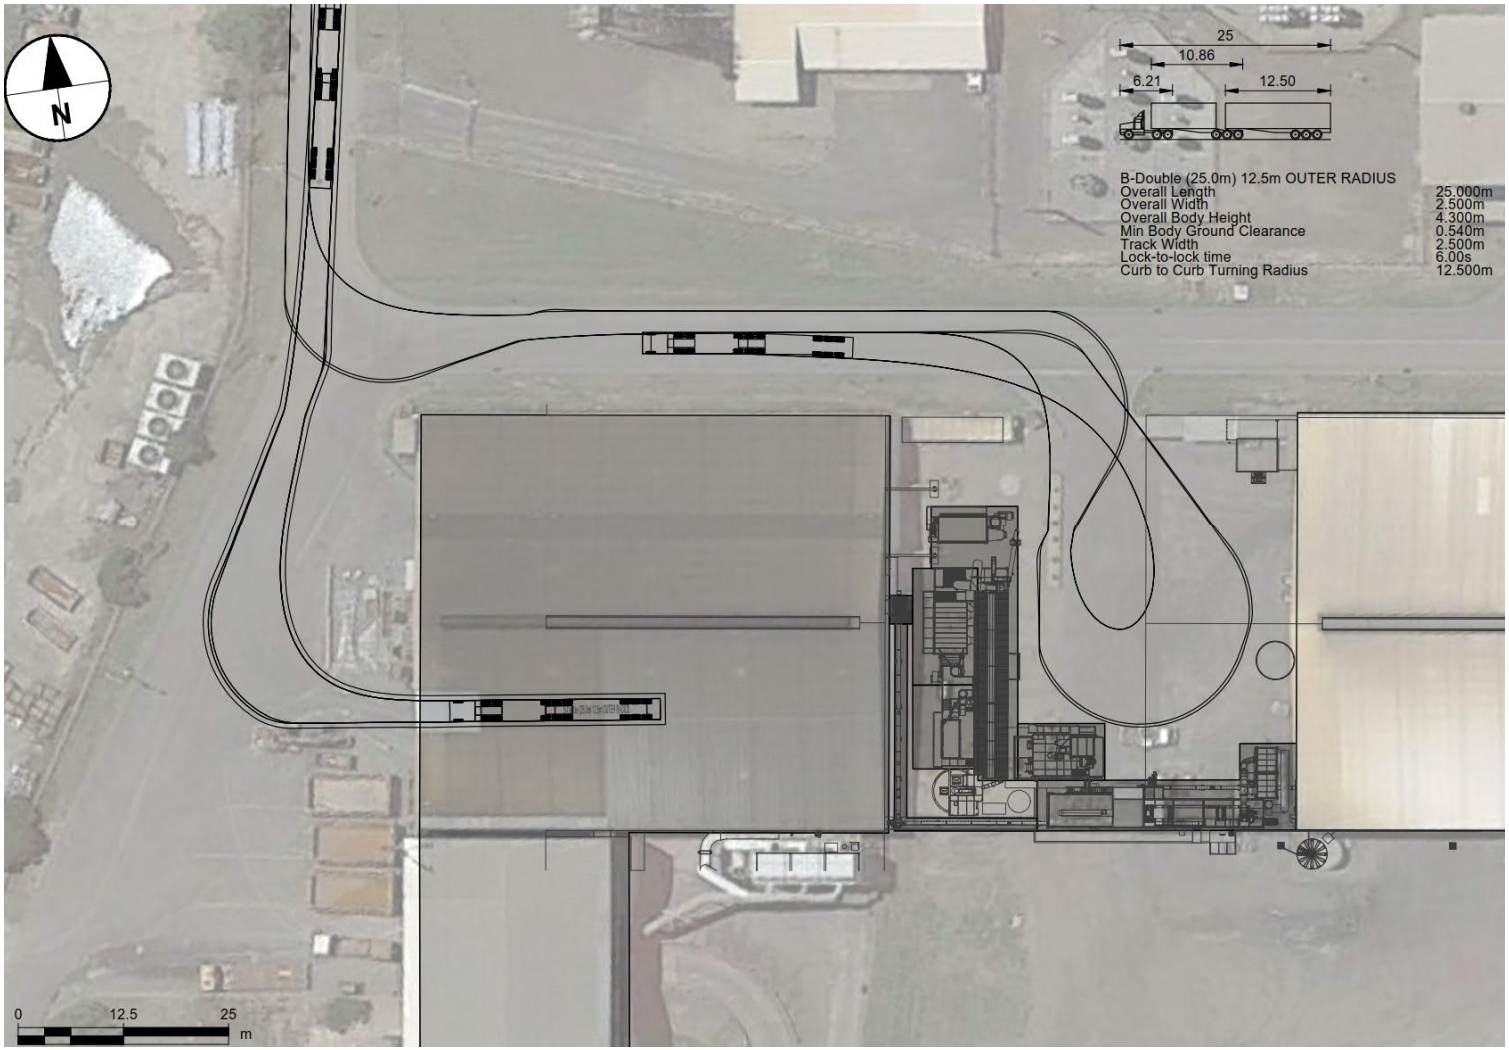


**Figure 19 Vehicle swept path analysis**

As the facility is identified as potentially hazardous for transport, the existing traffic route has been reviewed with consideration of *HIPAP No.11 – Route Selection* (NSW DP&I, 2011).

Route selection options from the facility are limited and it is considered that the current routes best address the principles and objectives of *HIPAP No.11 – Route Selection* (NSW DP&I, 2011). The current route is considered suitable for the heavy vehicle movements proposed as part of the Project because: Therefore, no change to the existing traffic routes is proposed as a result of the Project modification.

- Key intersections are signalised and provide adequate turning geometries for B-doubles;
- The proposed route forms and approved route for B-doubles under the RMS General Mass Limits (GML) and Concessional Mass Limits (CML) road network map; and
- An alternate route selection is considered unlikely to improve the safety or performance of the existing road network.

**Summary**

The information used to inform the traffic assessment prepared for the 2009 EA and Tomago Aluminium EA was reviewed for consistency against the Project (as modified). The assessment has determined the following:

- The Project is likely to generate approximately 90 truck movements a week in addition to the existing truck trips;
- There would be no additional passenger vehicle movements associated with operation of the modified facility, as the existing workforce is not expected to change;
- Overall truck movements from the Tomago Aluminium smelter were predicted to be 454 daily in the 2009 Tomago Aluminium EA however the actual observed truck movements every day is 134 trucks (Tomago Aluminium, 2016). This refers to a 70% reduction in the development traffic than predicted by the traffic assessment undertaken as part of 2009 EA. Therefore, it is expected that there is spare capacity available on the network for the anticipated additional traffic on the external roads;
- The additional traffic expected to be generated by the Project is expected to be 13 two-way truck movements per day. This relates to approximately 0.05% of the existing AADT along key external road corridors of haulage route. Therefore, the additional traffic is generally likely to have limited impact on the overall operation of the road network;
- Two key intersections along the Industrial Drive are expected to operate at satisfactory LOS even with the additional traffic likely to be generated by the facility. This is evident from the existing LOS of these intersections as extracted from past studies. It is considered that surrounding intersections are not likely to experience any substantial changes in levels of service as a result of the Project; and
- Further quantitative assessment would not substantially improve the understanding of potential traffic impacts or alter the outcomes of the previous assessment as the expected increase in traffic due to the proposed changes to the SPL facility is of the order of 0.05% of the existing traffic on the main roads.

In summary it is considered that the potential traffic impacts associated with the Project (as modified) are likely to remain substantially the same as the original approved development.

### 7.4.4 Mitigation Measures

To reduce the potential impacts of construction traffic, all construction contractors would be required to employ relevant traffic management measures to ensure safety and minimise potential impacts to traffic flow on the surrounding road network, including the following:

- Operate in accordance with the *Road Transport Act 2013*;
- Construction vehicles carrying loose materials to and from the site would be covered after loading (prior to traversing public roads) to prevent wind-blown dust emissions and spillages;

- In the event of a spillage of materials from construction vehicles onto a public road, the RMS & EPA would be notified and the spilled material would be removed;
- Construction traffic would traverse public roads as outlined in the EA, which are public roads that are suitable for heavy vehicles; and
- Additionally, adequate on-site parking would be provided for construction traffic so that no construction vehicles would be parked on the surrounding road network.

The following specific traffic mitigation measures would be applied to the Project during operation:

- Site access procedures including the proposed haulage route would be communicated to site personnel and heavy vehicle operators; and
- Trucks would ensure loads are appropriately covered and sealed to protect transported material from wind and rain.

## 7.5 Noise and Vibration

### 7.5.1 Background

A Noise Impact Assessment was prepared for the 2009 EA by Spectrum Acoustics. As part of the 2009 EA assessment, noise levels associated with the 20 ktpa thermal treatment plant were measured. Modelling for the assessment was undertaken with reference to local meteorological conditions which are still relevant today.

Atmospheric conditions most relevant to noise assessments are temperature inversions, gentle winds, and relative humidity. From long-term weather monitoring data, the atmospheric environment throughout the Hunter Valley region is well classified. Spectrum Acoustics noted the most significant points relevant to noise propagation as a result of local meteorological conditions are that:

- Extremes of relative humidity (RH) are rarely experienced. For modelling purposes, a value of 70% RH was adopted;
- Winds are predominantly south-easterly in summer and north-westerly in winter. The DECC default wind speed of 3m/s at 10m altitude was adopted for modelling purposes;
- Moderate (F class) temperature inversions are likely to be a prevailing site feature in winter. A value of +3° C/100m vertical temperature gradient was adopted for modelling purposes; and
- The topography of the area surrounding the site is essentially flat with receivers at approximately the same relative level as the ground level at the proposed plant. Drainage winds associated with temperature inversions are therefore not considered.

These base assumptions were reviewed against current metrological data and confirmed to be generally consistent with the existing environment.

To support the findings of the 2009 EA Noise Impact Assessment, a supplementary noise model was prepared by AECOM in October 2018 to consider the potential noise and vibration impacts associated with the proposed capacity increase to 60 ktpa. The supplementary noise model assessed the cumulative noise impacts of the entire site under a worst case operation scenario and the adopted method and findings are discussed in **Section 7.5.4**.

### 7.5.2 Existing Environment

The existing Tomago Aluminium smelter site contains a variety of noise producing plant and equipment. The smelter operates 24 hours per day and noise sources are relatively constant.

In reference to the facility the existing SPL NSW EPA licence imposes noise limits shown in the table below:

**Table 41 NSW EPA Licence Noise Limits (Source: EPL13269)**

| Location | Day & Evening LAeq (15 minute) dB(A) | Night LA1 (1 minute) dB(A) |
|---|---|---|
| Residences on Tomago Road | 35 | 45 |
| Industrial Receivers | 70 | 70 |

Note: For the purpose of the **Table 41**:

- Day is defined as the period from 7am to 6pm Monday to Saturday and 8am to 6pm Sunday and Public Holidays;
- Evening is defined as the period 6pm to 10pm; and
- Night is defined as the period from 10pm to 7am Monday to Saturday and 10pm to 8am Sunday and Public Holidays.

There is no known history of noise complaints for the facility to date.

Within the vicinity of the Project site the nearest sensitive receivers are the following:

- Tomago Bowling and Sporting Club approximately 600m to the south (note there are no residential or accommodation components of this sports club); and
- Tomago Village Van Park located approximately 1.6km to the west.

The Noise Policy for Industry 2017 (NPI) establishes amenity noise levels for sensitive receivers that include active recreation areas (in this case Tomago Bowling and Sporting Club). The criteria for when an active recreation area (when in use) is 55 LAeq dB(A).

The nearest industrial receivers (apart from the Tomago Aluminium Smelter) are 660m west of the Project site which are within the Tomago Industrial Area.

The site is screened by current operations of Tomago Aluminium, other industrial buildings and an extensive vegetation buffer surrounding the site at Old Punt Road (approximately 1km north-west from site), Pacific Highway (approximately 1.8km west from site) and Tomago Road (approximately 600 metres south from site).

The nearest sensitive receivers to the Project site are shown in **Figure 20.**

**Figure 20 Nearest noise sensitive receivers to the Project site**

### 7.5.3 Potential Construction Impacts

Construction activities would be similar in duration, scale and nature to those previously described in the 2009 EA (as discussed in **Section 2.11**). Construction is estimated to be undertaken during a period of eight to ten months during standard working hours in accordance with the Interim Construction Noise Guideline (ICNG) (DECC, 2009).

Indicative construction plant identified within the Noise Impact Assessment prepared for the 2009 EA by Spectrum Acoustics was reviewed for consistency against the proposed construction methods required for the Project (as modified) (see **Table 42**). The construction plant proposed for the Project remains generally consistent with that described in **Table 42**.

**Table 42 Typical Noise Levels – Indicative Construction Plant Lw (Spectrum Acoustics, 2007)**

| Plant Item | dB(A) L10 |
|---|---|
| Oxy Cutters | 100 |
| Concrete Pump | 109 |
| Compressor | 100 |
| Crane | 107 |
| Angle Grinder | 102 |

The construction noise assessment goals presented in the ICNG are referenced to Noise Management Levels (NMLs) for residential, sensitive land uses and commercial/industrial premises. The nearest sensitive receiver Tomago Bowling and Sporting Club is classified as an active recreational areas with a NML of 65 LAeq dB(A).

The 2009 EA assessment results identified that noise generated during construction would not add substantially to the overall noise emissions from the aluminium smelter site. Potential impacts relating to noise and vibration during construction are expected to remain substantially the same for the Project when compared against the 2009 EA.

Furthermore, given the distance to the nearest sensitive receiver (600m south of site), the location of the site within an existing operational industrial smelter site and substantial area of vegetated buffer lands, it is anticipated construction noise impacts would be minor. In summary, no adverse impacts are predicted as a result of construction of the proposed facility (as modified).

### 7.5.4 Potential Operational Impacts

The facility would continue to operate 24 hours per day, 7 days per week. No change to the existing operating hours or truck movement times is required for the Project.

The Project would result in the construction of an additional thermal treatment plant and an increase in SPL processing capacity from 20,000tpa to 60,000tpa. The 2009 EA used reference monitoring data obtained during a demonstration of critical plant elements and existing plant on the site and surrounds (thereby including Tomago Aluminium operations) including gas treatment centres, stacks, fans and the electrical switchyard (comprising 79 sources in total). No source of substantial vibration has been identified during operation of the Project. Critical plant elements as considered in the 2009 EA are identified in **Table 43**.

**Table 43 Power Level Spectra of Measured Noise Sources, dB (Spectrum Acoustics, 2007)**

| Noise Source | dB(A) |
|---|---|
| Thermal Treatment Plant | 106 |
| Sizing Plant (internal) | 83 |
| Dust Collection System | 106 |
| Vehicles (Leq (15min) as described below) | 90 |

The results of quantitative noise modelling undertaken to inform the 2009 EA are summarised in **Figure 21**. The assessment indicated that generally, there is no discernible change in noise levels at the identified sensitive receivers as a result of operation of the facility.

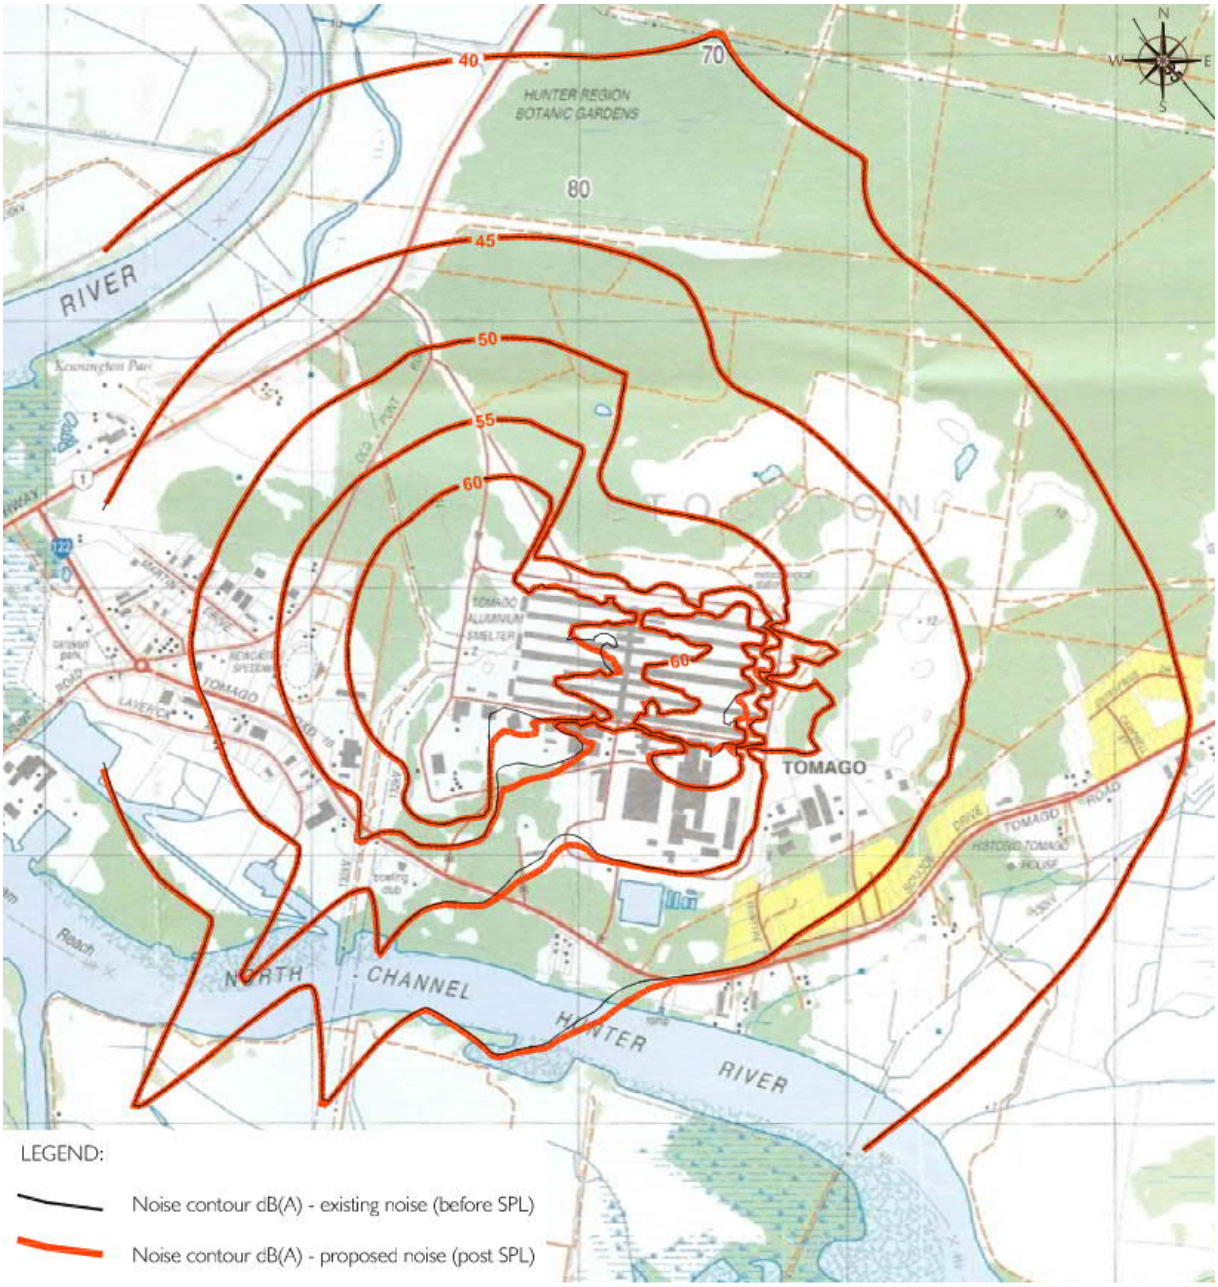

**Figure 21 Noise Contours – Pre and Post Operation of the Originally Approved SPL Facility (Spectrum Acoustics, 2007)**

The Project would introduce an additional noise emission source being the 40 ktpa thermal treatment plant. It is considered that the Project as modified has the potential to generate additional noise emissions when compared to the 2009 EA.

To support the findings of the 2009 EA Noise Impact Assessment, a supplementary noise assessment model was prepared in October 2018 to consider the potential noise and vibration impacts associated with the proposed capacity increase to 60 ktpa. The supplementary noise model assessed the cumulative noise impacts of the entire site under a worst case operation scenario.

Supplementary sound modelling was undertaken in accordance with the Noise Policy for Industry 2017 using SoundPlan (Version 7.3) to identify the predicted noise levels from the Project at nearby

receivers. The following features were included in the noise model; existing ground topography, ground absorption, buildings and the nearest noise sensitive receivers. Worst case weather conditions (F class temperature inversion with a 2 m/s wind source to receiver) have been modelled.

For the purposes of this assessment, the sound power level of the 40 ktpa thermal treatment plant has been assumed to be equivalent to the sound power level of the 20 ktpa thermal treatment plant plus a 3 dB factor to provide a conservative assessment.

The modelled noise contribution from the 60 ktpa Thermal Treatment Plant and the overall cumulative noise levels are presented in **Table 44.**

**Table 44 Predicted noise levels**

| Receiver | Predicted Noise Level, $L_{Aeq}$ dB(A) | | | |
|---|---|---|---|---|
| | Existing[1] | 60 ktpa Thermal Treatment Plant Contribution | Cumulative | Difference |
| 1940 Pacific Highway, Tomago | 48 | 37 | 48 | +0.3 |
| Tomago Village Van Park | 47 | 37 | 47 | +0.4 |
| Tomago Bowling & Sporting Club | 53 | 46 | 54 | +0.8 |
| Tomago Periodic Detention Centre | 57 | 42 | 57 | +0.1 |

*Notes:*

*Existing noise levels from the Regain facility include the entire aluminium smelter plant and the 20ktpa SPL facility*

With the addition of the 60 ktpa Thermal Treatment Plant the predicted noise levels increase by less than 1 dB over the existing plant noise levels, meaning there will be a negligible change in overall impacts as a result of the Project. The largest increase in modelled noise levels occur at the Tomago Bowling & Sporting Club, increasing by 0.8 dB. At this location the noise level increases from 53 dB(A) to 54 dB(A) (when rounded) which remains below the Noise Policy for Industry 2017 amenity criterion for active recreation areas of 55 dB(A).Therefore the acoustic amenity at nearby noise sensitive receivers is unlikely to be affected.

Whilst noise emissions may increase (to no greater than +0.8 dB(A)) during operation of the Project, this increase is of a size that is generally imperceptible to the human ear. Therefore environmental noise impacts resulting from potential noise emissions during operations are expected to be negligible. In summary the addition of a 40 ktpa thermal treatment plant would not increase the cumulative noise output of the entire site, under a worst case scenario, to a level which would significantly impact the amenity of sensitive receivers or substantially alter the previously predicted noise levels assessed in the 2007 Spectrum Acoustics Noise Assessment.

### 7.5.5 Potential Operational Traffic Noise Impacts

Existing site access for employees would be maintained. As the facility would maintain the same level of employees (approximately 8) no substantial change in light vehicle traffic movements is predicted to occur. Noise generated by employee traffic during operation of the facility is considered unlikely to impact on sensitive receivers.

The Project is conservatively estimated to generate up to an additional 120 truck movements per week to transport SPL waste materials to and treated product from the facility. Heavy vehicles would use the north-west access road within the Tomago Aluminium site towards Old Punt Road (see **Figure 6**).

Other industrial buildings and an extensive vegetation buffer surround the site screening Old Punt Road (approximately 1km north-west from site), Pacific Highway (approximately 1.8km west from site) and Tomago Road (approximately 600 metres south from site). To the north an electrical substation is the only building located along Old Punt Road (approximately 750 north-west).

A residential property (number 1940) is located on the Pacific Highway approximately 580m from the Old Punt Road and Pacific Highway intersection. Traffic traveling along Old Punt Road would be screened by approximately 8ha of contiguous remnant bushland which would attenuate noise generated by heavy vehicles. The façade of the residential property is located approximately 60m from the Pacific Highway. The Pacific Highway at this location provides a regional connection between Sydney, Newcastle and the North Coast and handles significant traffic volumes. The 2009 EA estimated that the Pacific Highway and Tomago Road intersection handled approximately 40,000 traffic movements per day. Assuming there has been no background traffic growth since 2009 and that the modification combined with the existing Regain operation would result in a total of 120 truck movement per week, or approximately 18 per day, this equates to an increase of 0.0005%. Therefore it is considered unlikely that traffic generated by the Project would substantially impact on this residential property or any other identified receivers.

The additional truck movements within the broader road network would occur along public roads currently accessed by existing trucks travelling to and from the site. While the proposed Project would result in a small increase the amount of heavy vehicle traffic, given the substantial volume of traffic using the road network between the smelter, the Port of Newcastle, and other main delivery destinations (for example Sydney industrial areas), any increase in traffic noise generated by the Project would be marginal.

The 2009 EA predicted that traffic noise levels were unlikely to exceed night time criterion at the façade of any receivers greater than 10m from the centre of the road and there were no residences in this zone. Due to the negligible increase in traffic that would result from the modification, it is expected that the operational traffic route would continue to operation in accordance with the DECCW 2011 NSW Road Noise Policy. Therefore it is anticipated that any potential traffic noise impacts generated by the Project would be minor.

**Assessment of Potential Noise and Vibration Impacts - Summary**

The information used to inform the Noise Impact Assessment prepared for the 2009 EA was reviewed for consistency against the Project (as modified). It is considered that further quantitative assessment would not substantially improve the understanding of potential noise and vibration impacts or alter the outcomes of this assessment.

In summary it is considered that the potential noise and vibration impacts associated with the Project (as modified) are likely to remain substantially the same as the original approved development.

### 7.5.6 Mitigation Measures

- Unless otherwise agreed with DP&E, construction activity likely to impact on sensitive receivers would only occur during the following periods:
  - 7.00am to 6.00pm Monday to Friday;
  - 8.00am to 1.00pm Saturday; and
  - No work Sundays or public holidays.
- Operational noise levels would be maintained in accordance with EPL13269 and Licence Noise Limits identified in **Table 41**;
- Construction traffic would use the heavy vehicle route proposed in **Figure 6**;
- During operations heavy vehicles would use the heavy vehicle route proposed in **Figure 6**; and
- During operations light vehicles would use the passenger vehicle route proposed in **Figure 6**.

## 7.6 Soil and Water Quality

### 7.6.1 Existing Environment

The nearest waterway to the facility is the northern channel of the Hunter River, which is located around 850 metres to the south. A stormwater collection pond which is a component of the Tomago Aluminium stormwater management system is located around 900 metres to the south east of the facility.

The nearest coastal wetland mapped under the Coastal Management SEPP is located around 1 kilometre to the south of the facility, adjacent to the northern channel of the Hunter River. The nearest wetland mapped under LEP 2013 are located around 600 metres to the south of the facility, on the southern side of Tomago Road. Wetlands mapped under LEP 2013 are also located around 650 metres to the south east of the facility around and including the Tomago Aluminium stormwater collection pond. Soils around the facility consist primarily of sandy soils with poor drainage. The facility is located on land identified as Category 4 acid sulfate soils on the Port Stephens LGA Acid Sulfate soil map.

Tomago Aluminium monitors the fluoride concentration of surface water and groundwater in the vicinity of the site in accordance with EPL 6163. The average fluoride concentration of surface waters is generally below 1mg/L (Tomago Aluminium Company, 2017).

The Tomago Sandbeds are located to the north of the Tomago Aluminium smelter site and are an important local underground potable water resource. The Tomago Sandbeds are a Hunter Water Special Area gazetted under the *Hunter Water Act 1991* and the extent of this area is shown in **Figure 22** along with the groundwater draw zone for the sandbeds.

AECOM

Capacity Increase at the Regain Spent Potliner Facility

0 100 200 400 Metres

**28/09/2018**

60512726

Fig. **22**

The hydraulic gradient beneath the facility slopes south towards the Hunter River, away from the Tomago Sandbeds. The groundwater table is within 2.5 to 5 metres of the surface in this location. Operations and activities undertaken at the Tomago Aluminium smelter are managed to control emissions and ensure minimal impact to the environment, including the Tomago Sandbeds.

Groundwater monitoring is also undertaken on a regular basis in proximity to the facility. Available groundwater monitoring data includes sites monitored by the Hunter Water Corporation and Tomago Aluminium. The groundwater in the area generally has a low pH level (less than 6.5) and generally low salinity (< 200mg/L).

Groundwater monitoring data sampled by Hunter Water within the Tomago Sandbeds indicate that fluoride concentrations remain at background levels (Tomago Aluminium, 2017). The average fluoride level in the monitoring bores bordering smelter operations is 1.8mg/L, slightly above the NHMRC / NHMRC 2004 Drinking Water Guideline of 1.5 mg/L. However, these concentrations dissipate with distance from the smelter as demonstrated in offsite groundwater monitoring bores located to the south of the smelter which are located in the direction of local groundwater flow.

**Existing Stormwater Management**

The handling of SPL and treated product (including the loading and unloading of trucks) is carried out within hardstand and bunded areas to prevent potential SPL or product spills being released to nearby drains and stormwater run-off channels. This water is captured, managed and reused as part of the existing SPL treatment process. Stormwater is reused in site processes in three ways:

- As part of a chemical reaction during the SPL treatment process;
- Emitted as water vapour; or
- Contained within the products of the SPL Recycling Facility.

Water discharges from the existing facility are therefore typically limited to stormwater discharges outside of these bunded areas. Drains and stormwater channels at the facility (outside of the bunded areas described above) direct stormwater to the existing Tomago Aluminium stormwater management system which directs stormwater runoff to a stormwater collection pond. Stormwater discharges at the facility are managed in accordance with the conditions of EPL 6163.

The stormwater collection pond accepts the 'first flush' during a storm event, which is defined as the total runoff resulting from the Tomago Aluminium site in a 1 in 10 year storm event. The Tomago Aluminium stormwater collection pond has a capacity of 16,000 $m^3$. Water is discharged from the stormwater collection pond directly into the Hunter River (EPL 6163 licenced discharge point 16) at a controlled rate to ensure that fluoride levels are managed within specified limits as required by EPL 6163.

In the event of a rainfall greater than a 1 in 10 year event, excess stormwater runoff is assumed to contain a lower fluoride content given dilution from initial flows. These excess flows are discharged directly into the Hunter River (EPL 6163 licenced discharge point).

There are no existing capacity issues for the stormwater management system.

**Existing Site Water Balance**

The facility is contained within sealed sheds on concrete foundations. Therefore, losses to the soil and groundwater are negligible. As described above, rainfall events at the existing facility are managed within the Tomago Aluminium stormwater management system and are therefore not an input for the site water balance.

Water is supplied to the Regain facility via an existing Tomago Aluminium Company connection which is in turn supplied by the Hunter Water Corporation potable water network. Water usage for the Tomago Aluminium site connection was recorded as approximately 556,100kl for 2017. It was estimated that the Regain facility would consume around 20,000 kilolitres of process water from the Tomago Aluminium smelter per year in the 2009 EA. A review of historic water usage has found that water usage has declined in recent years based on process optimisations consuming less water during hydrolysis of SPL and changes in site cleaning and wash-down practices. Water used in the thermal treatment process is lost to the atmosphere as steam within controlled stack emissions.

Amenities at the facility generate around 100 kilolitres of wastewater per year which is pumped into the Tomago Aluminium on-site treatment system, which is sized for 1000 EP (equivalent population). There are no existing capacity issues for the existing treatment system.

**Contamination**

SPL is classified as a Dangerous Good, is an Environmentally Hazardous Waste, and requires careful handling and disposal in accordance with regulatory requirements. SPL can no longer be disposed of in landfills. The composition of the SPL material is highly variable. Constituent contaminants within SPL can contain up to 10% aluminium and sodium nitrides and carbides.

The potential for contamination during SPL processing primarily relates to the handling of SPL, including during truck loading/unloading. All handling of SPL is carried out within, hardstand bunded areas. Shed 5 is fitted with rumble grids which minimise the potential for SPL material to be tracked from site and the shed has been purpose-built for SPL handling. SPL material is conveyed to the thermal treatment plants by enclosed conveyor. These measures are implemented to prevent soil and water contamination. The existing Tomago Aluminium surface water and groundwater monitoring network monitors contaminant levels at the facility.

### 7.6.2 Potential Impacts

**Stormwater Management**

The stormwater controls for the Project are described in **Section 2.2.7**. The Project would not result in any substantial alteration to existing hardstand areas or impervious surfaces.

The hardstand SPL process plant and truck loading areas (in the southern section of the area between Shed 5 and Shed 6, see **Figure 3**) would be bunded to prevent potential spills of SPL or treated product being released to nearby drains and stormwater run-off channels. Some areas of existing gravel hardstand would be reformed and sealed to reduce the potential for water infiltration (which is considered to be negligible). Stormwater captured from these areas would be reused in site processes consistent with existing operations. There would be no process water discharged from the site as a result of the Project.

A first flush capture system would collect potentially contaminated water from the north and south side of the hardstand, bunded area between Shed 5 and Shed 6 (see **Figure 3**). The catchment of this area is around 2,500m$^2$. The stormwater design for this area has considered this catchment area and potential rain volumes during storm events in accordance with Port Stephens Council Stormwater Drainage Handbook. The design allows for runoff to be captured during a 1 in 1 year storm event.

Each sump would incorporate screens to capture debris and settling chambers to allow for periodic recovery of any sediment. Sump pumps would be activated by float switch as water levels rise, allowing for water recovery during a rainfall event. Storage tanks would include high-level switches to prevent any overflow. Each storage tank would include a fine aperture mesh screen to collect any finer materials. Mesh screening would also act to prevent ingress of mosquitos and breeding.

Water captured in the storage tanks would be reused in site processes consistent with existing operations. Recovered water is used in the Thermal Treatment Plant Reactor or sprayed on to stockpiles as part of dust control. The measures outlined in **Section 7.6.3** would be implemented to provide for the efficient ongoing operation of stormwater infrastructure.

In the event that the storage tank(s) reach capacity during a rainfalls event, additional stormwater is considered to have a low potential for contaminants as contaminants would be primarily mobilised in the first flush stormwater flows and heavily diluted during a heavy rainfall event. Therefore during sustained heavy rainfall events (e.g. greater than 1:1 year event) excess stormwater would flow from the first flush systems to the existing Tomago Aluminium stormwater management system. This process would represent a reduction in total stormwater discharged from site due to increased available stormwater storage capacity and no change in existing catchments.

The measures outlined in **Section 7.6.3** would be implemented to provide for the efficient ongoing operation of stormwater infrastructure.

Stormwater from the northern side of the hard stand area between Shed 5 and Shed 6 (see **Figure 3**) would drain to the existing Tomago Aluminium stormwater management system, consistent with existing operations.

Shed 5 and Shed 6 would utilise internal collection drainage systems to capture any leachate. Shed 5 is maintained in a generally dry condition as no water is used during the SPL treatment process (based on material handling requirements of SPL). Shed 6 water usage is generally limited to periodic wetting down of the treated product to maintain moisture content in the range of 5%.

Given that the Project would not result in any substantial alteration to existing practices, processes, hardstand areas or impervious surfaces; stormwater volumes discharged to the Tomago Aluminium stormwater management system would remain substantially the same or reduce. Therefore the capacity of the Tomago Aluminium stormwater system would not be compromised. There would be no substantial change to the existing contribution of the facility to stormwater volumes discharged at EPL 6163 licenced discharged points.

The facility for the Project has been designed to efficiently direct stormwater flows to appropriate drains and channels for reuse or discharge. It is unlikely that there would be areas of stagnate or pooled water at the facility (with the exception of a blockage in the drainage system, which would be repaired as soon as practicable) and therefore the potential for mosquito populations that would warrant specific mosquito management measures is considered unlikely. Stormwater tanks would employ appropriate mesh to prevent ingress of mosquitos for breeding.

**Contamination**

As described in the stormwater section above, potential stormwater contamination would be appropriately managed for the Project through the implementation of stormwater management controls. SPL handling would be undertaken within hardstand and/or bunded areas which would minimise the potential for soil contamination. Shed 5 and Shed 6 would utilise internal collection drainage systems and storage tanks for the containment and management of any leachate.

**Potential Impacts to Soil, Surface Water and Groundwater Quality**

Given that the Project would reuse potentially contaminated stormwater onsite and that there would be no change to existing stormwater flows to the Tomago Aluminium stormwater management system, it is considered that the risk of potential impacts to nearby soil and surface water quality and wetlands would not change for the Project.

The risk of potential contamination impacts to the Tomago Sandbeds from the mobilisation of contaminants through stormwater would therefore also not change for the Project. The existing risk is minor given that the hydraulic gradient beneath the facility slopes south towards the Hunter River, away from the Tomago Sandbeds.

The Human Health Risk Assessment (HHRA) prepared for the Project (refer to **Section 7.3**) considered contamination impacts from air emissions such as leaching from soil to groundwater and surface water, transport of leached contamination within groundwater, volatilisation and vapour migration from subsurface media. It was determined that these potential impacts are not significant.

The HHRA identified that the contaminant mass that may leach from soil is likely to be minimal given the high molecular weight and physio chemical properties of the contaminants which may be subject to deposition. Organic contaminants are less mobile and are less likely to bind to the soil. Inorganic contaminants (i.e. metals) are unlikely to bind to water. Therefore, the Tomago Sandbeds and other subsurface media are unlikely to be impacted by the Project via leaching from soil.

Changes in surface water or groundwater quality parameters would be identified by the existing Tomago Aluminium surface water and groundwater monitoring network.

### Project Site Water Balance

The Project would not result in a change to the site water balance described in **Section 7.6.1**. A review of historic water usage has found that water usage has declined in recent years based on process optimisations consuming less water during hydrolysis of SPL and changes in site cleaning and washdown practices. Combined with additional stormwater controls these process water efficiencies would mean that it would not be required to increase water consumption above the original estimate of 20,000 kilolitres of process water described in the 2009 EA. Existing water usage patterns are not expected to change substantially as a result of the modified Project.

Revised estimated annual water consumption for the SPL Processing Facility if operated at 60,000 tpa capacity are summarised in **Table 45.**

**Table 45 Estimated Water Consumption (kilolitres)**

| Application | Annual Volume | Maximum Demand | |
|---|---|---|---|
| | | Daily | Weekly |
| Process Water | 18,000 | 55kl | 370kl |
| Operator amenities | 500 | | |
| Captured Stormwater | -400 | n.a | n.a |

The estimated annual water consumption for the Project is considered minor in comparison to existing water usage for the broader Tomago Aluminium site, which is a shared connection. Water usage is correlated to the aluminium production process and estimated to range between 0.90kl and 0.95kl per tonne of aluminium produced. The aluminium smelter is approved to produce up to 600,000tpa. On this basis the estimated total water usage associated with the Regain facility would range between 3 to 4 percent of total water usage for the Tomago Aluminium site. Given the scale of existing activities and variability in aluminium production rates it is considered unlikely that the Project would contribute to a noticeable change in overall water usage patterns for the site.

There would be no change to piping infrastructure for the Project and therefore all process, potable and stormwater would be separated and managed according to existing piping arrangements.

## 7.6.3 Mitigation Measures

Potential impacts to soil and water quality have primarily been mitigated through the design of the Project. The stormwater controls outlined in **Section 7.6.2** would be implemented for the Project for the effective management of stormwater, including stormwater that is potentially contaminated. The implementation of the following measures would provide for the efficient ongoing operation of stormwater infrastructure:

- Where feasible given recent periods of rainfall, water levels would be held so that there is 18 kilolitres of storage capacity;
- Where feasible given recent periods of rainfall, water levels would be held so that there is at least 12 kilolitres of storage capacity within two calendar days of predicted rainfall events; and
- The stormwater system would be subject to regular housekeeping, preventative maintenance and testing.

## 7.7 Waste

The facility operates in accordance with Environment Protection Licence (EPL) 13269 and Environmentally Hazardous Chemicals Licence #88. Existing scheduled activities defined under EPL 13269 are identified in **Table 46**.

**Table 46 Existing Scheduled Activities nominated for the Regain Facility**

| Fee Based Activity |
|---|
| Recovery of hazardous and other waste |
| Waste storage – hazardous, restricted solid, liquid, clinical and related waste and asbestos waste |

A variation to EPL 13269 would be required to ensure consistency of wording between the proposed modification and the EPL.

The Project would not alter the current waste streams accepted by the site (being SPL). A summary of estimated waste material received by the facility as part of the Project is provided in **Table 47**.

**Table 47 Estimated SPL Waste Material Received by the Facility**

| Source | Weekly Estimates (tonne) | Annual Estimates (tonne) |
|---|---|---|
| Tomago Aluminium Smelter | 2,400 | 15,000 |
| Other Aluminium Smelters | | 45,000 |
| Total | 2,400 | 60,000 |

Weekly estimates are considered a conservative maximum and it is considered that under typical operation the quantities of SPL material received would be less. Actual quantities received would be driven by market supply, economic considerations and environmental licencing requirements. A maximum of 60,000 tonnes of SPL material would be accepted by the facility per annum.

### 7.7.1 Existing Environment

**Basel Convention**

The Basel Convention is a United Nations Treaty (to which Australia is a signatory) which aims to control transboundary movements of hazardous wastes and their disposal. The overarching objective of the Convention is to protect human health and the environment against the adverse effects of hazardous wastes.

The provisions of the Convention centres around the following principal aims:

- The reduction of hazardous waste generation and the promotion of environmentally sound management of hazardous wastes, wherever the place of disposal;
- The restriction of transboundary movements of hazardous wastes except where it is perceived to be in accordance with the principles of environmentally sound management; and
- A regulatory system applying to cases where transboundary movements are permissible.

Historically, SPL was either stockpiled locally or sent overseas for processing due to the lack of treatment facilities in Australia. The Regain facility at Tomago offers a domestic solution for the processing of SPL, which will eliminate the need for transport of this hazardous waste offshore.

**Processed Waste Materials and Products for Current Operations**

The waste materials processed at the facility are limited to aluminium smelter wastes containing leachable fluoride and/or leachable cyanide. Most of the waste material is SPL. In addition to the SPL a relatively small quantity of waste anode carbon are processed.

There is no blending or mixing with other products at any stage during the processing of SPL. Blending during the processing of SPL is limited to the blending of different batches of processed material for quality control purposes as described in the section below.

The Facility's operational processes do not generate raw SPL material or by-product wastes. The products manufactured at the facility are designed for use in cement manufacture. The existing facility sources SPL waste directly from the Tomago Aluminium smelter and from other suppliers via trucks. An administrative modification of Project Approval 06_0050 (Mod 1) was granted on 16 November 2016 to remove restrictions on the source of suppliers of SPL waste.

**Spent Pot-Lining (SPL)**

SPL consists of the carbon and refractory cathode lining of the smelting pots, produced when the pots are periodically rebuilt. These carbon and associated refractory wastes are impregnated with low concentrations of various contaminants including fluoride and cyanide salts. Pot lining has a life cycle of six to seven years after which the deteriorated pot lining (SPL) is replaced as part of the periodic individual rebuilding of the pots.

The range of chemical composition of waste materials that are processed at the facility is provided in **Table 48**.

**Table 48 Range of waste material chemical composition**

| Element | Note | Unit | Anode carbon material | Carbon cell lining | Refractory cell lining |
|---|---|---|---|---|---|
| Carbon | | Percentage | 45-80 | 30-50 | 2-7 |
| Silicon | As $SiO_2$ | Percentage | 0-5 | 2-15 | 10-40 |
| Iron | As $Fe_2O_3$ | Percentage | 2-10 | 2-4 | 1-6 |
| Aluminium | As $Al_2O_3$ | Percentage | 10-25 | 10-30 | 15-30 |
| Titanium | As $TiO_2$ | Percentage | 0-2 | 0-2 | 0-2 |
| Calcium | As CaO | Percentage | 0-2 | 1-5 | 1-5 |
| Magnesium | As MgO | Percentage | 0-1 | 0-2 | 0.5-2.5 |
| Sodium | As $Na_2O$ | Percentage | 5-15 | 3-25 | 5-30 |
| Potassium | As $K_2O$ | Percentage | 0-1 | 0.2-1 | 0.5-1.5 |
| Fluorine | Total | Percentage | 5-15 | 5-15 | 5-15 |
| Cyanide | | mg/kg | - | 100-4000 | 100-1500 |
| Fluoride | Leachable | mg/L | - | 500-3600 | 300-3000 |
| Cyanide | Leachable | mg/L | 0-1 | 0.1-20 | 0.05-10 |

SPL is classified as a Dangerous Good and an Environmentally Hazardous Waste. It requires careful handling and disposal in accordance with regulatory requirements. SPL materials are currently stored at the TAC smelter in a number of secure, dry storage sheds prior to disposal. SPL material has historically been stored on site at the smelter prior to being shipped overseas for treatment and/or reprocessing for beneficial reuse.

A condition of consent (DA 4908/90) for the smelter requires that a system be adopted at the plant to enable the treatment of SPL into non-hazardous waste or a useable product.

SPL reprocessing not only fully recycles a waste product, but also generates end-products that reduce the consumption of fuel and raw materials in the brick and cement industries.

**Waste Handling**

Waste handling activities are undertaken in accordance with the site Environmental Management Plan which identifies specific material handling and processing procedures and controls to mitigate hazards and risks associated with handling an Environmentally Hazardous Waste. Specific controls include:

- Maintaining a Hazardous Substances Register;
- Regain Chain of Custody Standard;

- Product Control Standard;
- Training to ensure staff are appropriately trained to operate equipment and respond to spills or incidents;
- Risk Control Register including specific Material Handling Risk Controls;
- Site & Traffic Risk Controls;
- Toolbox Meetings; and
- Inspection and Service Check-sheets.

Further information on Hazard and Risk Management Standards is provided in **Appendix F.**

SPL material is stored undercover in Shed 5. Shed 5 incorporates a SPL material is handled and processed in an enclosed environment either in Shed 5 or by enclosed plant elements maintained under slight negative pressure (to control the potential for fugitive dust emissions). Material is thermally treated pre the description provided in **Section 2.3** and in general accordance with the 2009 EA. Treated materials are stockpiled in Shed 6. Shed 6 employs a series of sprays to maintain the product in a moist condition, preventing dust generation.

The facility incorporates rumble grids and capture drains at the doorways of main process buildings (Shed 5 & 6). Regular housekeeping checks and sweeping of site roads and paved areas is undertaken as required to maintain a tidy workplace.

Visual inspections of trucks and trailers are undertaken following unloading of SPL materials.

Handling of SPL is undertaken in accordance with appropriate site specific health and safety management practices considering the hierarchy of hazard controls. Relevant environmental controls include dust extraction for Shed 5, purpose built machinery incorporating an air-filtered cabin further reducing potential exposure to SPL materials and appropriate task specific personal protective equipment and safety showers.

The health of each Regain operator is monitored with regular health assessments considering lung function and fluoride levels in urine. This program has been underway since 2004 and has involved 44 people working at Regain facilities at Tomago, Kurri Kurri and at Point Henry in Victoria. Each person typically had at least one fluoride and one lung function test per year. The results of this testing has shown no long term change or deterioration in the health of the people working at Regain SPL processing facilities.

**Chain of Custody**

The supply chain of products including all stages from receipt of by-products from aluminium smelting operations, processing by Regain, production of new products, storage and transport of products up until the release of the products to Customer for consumption is referred to as the chain of custody.

Regain ensures that materials under its control are stored and transported in accordance with all appropriate regulations.

**Material Safety Data Sheets -** Material Safety Data Sheets are available for each of the materials (including products) that are under Regain control.

**Product Specification -** Each consignment contains products that meet a specification recorded in the commercial agreement between Regain and the Customer who takes delivery of products for consumption.

**Traceability -** The source(s) of material for each batch are known. Each consignment of product is made up from one or more identified batches of product that meet the required product specification.

**Storage and Transport -** Raw materials and products are stored and handled in accordance with appropriate regulations and in accordance with commercial agreements with other parties.

**Review -**The adequacy and effectiveness of the Regain Material Control Standard are reviewed by Regain Management periodically on a three year cycle and/or earlier in a given cycle if circumstances indicate an earlier review is appropriate.

The existing Material Control Standard and Chain of Custody Standard to which the site adheres are provided in **Appendix K**.

**Quality Assurance and Quality Control**

Site operations are governed by the Regain Management System which provides confidence that quality requirements are fulfilled. This integrated management system provides is the basis for quality assurance for the SPL Processing. The Regain Management System is based on International Standards Organisation (ISO) quality principles. Key reference standards are:

- The International health and safety system standard OHSAS 18001;
- AS/NZ 4801 Occupational Health & Safety Management Systems;
- ISO 14001 Environmental Standards; and
- ISO 9000 Quality Standards.

Items subject to quality control such as product batches, processes, controlled documents, equipment and instruments are identified and controlled along with records of evidence of compliance in the Regain Management System.

Quality control at key processing stages and in final products is achieved by batch control. This involves:

- Allocating material to batches;
- Sampling, testing and analysing the material in each batch; and
- Carefully controlling each batch.

Batches of processed SPL are tested for cyanide levels to verify destruction of cyanide above a threshold level of 60 parts per million. In the unlikely event that a batch of treated SPL had cyanide levels that did not meet specification then the batch would be rejected and reprocessed through the Thermal Treatment Plant. Products are made to a target chemical composition by blending batches of processed material of known chemical composition. Batches of product are tested and analysed to verify cyanide destruction and to ensure that the chemical composition meets the required specification. If a product batch (being a batch having undergone the cyanide destruction process) did not meet the required specification then the batch would be rejected and used as an input batch for another product batch blend. Batch samples are put into storage and retained for a period of no less than two years after the products made using the batch materials have been delivered from Regain custody to customers.

During typical operations batch sizes do not exceed 500 tonnes and the time of production of a batch from start of production to sending samples for testing does not exceed 2 weeks.

Laboratory testing and analysis is performed by independent third-party testing laboratories.

**Final Products**

A number of different final products are produced as part of the processing of SPL. A Safety Data Sheet (SDS) outlining chemical compositions for final products is provided in **Appendix G**. The quality assurance and quality control process outlined in the section above ensures that final products are consistent with desired specifications.

Final products are designed for a number of applications included uses as fluxes (a substance that lowers the temperature at which solid materials enter a liquid phase) and mineralisers (a substance that accelerates reactions rates) in cement manufacture. These products reduce energy requirements and greenhouse gas emissions associated with cement production.

The final products are high in fluoride, sodium, carbon and alumina which are associated with the following benefits:

- Fluoride accelerates the rate of alite formation (the major mineral phase in Portland cement formation) and causes more alite to form at a lower temperature;
- Sodium adds to the quality and strength of cement where raw materials are deficient in sodium;

- Carbon provides heat energy; and
- Alumina allows for the reduced consumption of other alumina corrective materials in the cement production process.

**Handling and Storage of HiCAl Products**

HiCAl products are not classified as dangerous goods for transport. HiCAl products do contain sodium fluoride which, along with other fluoride compounds, is recovered from SPL and contributes to cement clinker mineralisation. Sodium fluoride is leachable in water. Because HiCAl contains soluble sodium fluoride, any water must be contained with the HiCAl material. The following storage and handling practices are required:

- Avoid saturation with water
- Store under cover
- Contain any water that comes into contact with the product

Handling and storage recommendations are included in the SDS for each product (see **Appendix G**). Regain engages directly with logistics service providers and end-user cement plants to ensure that the awareness of the leachability hazard. An example of communication and training material for handling and storing HiCAl products is Regain document “Information Document - Product Handling HiCAl 30 Mineralising Carbon prepared for SCG Logistics” (Regain document code 198_082).

**Fluoride in Cement Products**

The fluorides present in SPL are retained in the HiCAl products to realise the beneficial effects of the fluorides in the cement manufacturing process. The principle raw material for cement clinker is limestone. Fluorine has a high chemical affinity with calcium and combines readily with the finely ground calcium carbonate in the clinkering process. In this way, the fluorides become permanently bound in the molecular structure of the cement.

Leachability testing of cement clinker and cement manufactured using HiCAl products indicates leachable fluoride levels of 1 mg/L in clinker and 0.5 mg/L in cement.

**Overall Reduction of SPL Waste Stream**

Randell Environmental Consulting conducted a feasibility assessment of using an agreement between industry and governments to clear the stockpiles of spent pot liner (SPL) present in Queensland, New South Wales, Victoria and Tasmania, over a ten year or similar period (REC, 2016). The feasibility assessment was undertaken for the Department of the Environment and Energy (DoEE) and is attached as **Appendix H**.

The assessment aimed to determine the feasibility of a joint agreement approach, and if feasible, what might be required to address the circumstances of the different SPL stockpiles across the jurisdictions.

Analysis confirmed that Australia has a significant stockpile of SPL with a total of around 700,000 tonnes of SPL in storages around Australia. The report identified the Tomago Aluminium smelter as one of four current operational smelters within Australia and that Regain has contributed to a substantial reduction in stored SPL at the TAC smelter.

### 7.7.2 Potential Impacts

Potential waste impacts for the Project relate primarily to the quantity of waste that would be processed at the facility. The type of waste and the management of waste streams at the facility would be generally consistent with the existing operations described in **Section 7.7.1**.

The Project would change the quantity of SPL waste processed at the facility. The process plant for the Project is designed to operate with 80% uptime (facility operating time) at a maximum throughput rate of 9 tonnes per hour. Maximum daily throughput would be 216 tonnes of SPL based on 100% uptime through the day. Maximum weekly throughput would be 1,500 tonnes of SPL based on 100% uptime for the week. Maximum annual throughput of waste material would be 60,000 tonnes of SPL. There are no solid or liquid residues from the process. 500 tonnes of aluminium metal and steel would be recovered from the 60,000 tonnes of waste material. The metals would be traded through the

secondary metals industry consistent with existing operations. The balance of 59,500 tonnes per year is transformed into products for the cement industry.

The chemical composition of processed SPL would not change for the Project. A SDS for SPL material is provided in **Appendix G**. Further information regarding the source of materials that the facility recovers from the aluminium smelting industry including the processing of by-product materials and hazard elimination is also included in **Appendix G.**

Regain has existing material handling and storage strategies to ensure appropriate handling of the material throughout all production steps. These strategies would continue to be implemented for the Project in general accordance with the 2009 EA.

The risk of untreated or partially treated SPL material entering the product stream is considered to be unlikely. However the environmental safeguards for the Project include automatic safety shut down procedures and alarms which are triggered by any deviation from the temperature ranges required to ensure effective thermal treatment. The risk of untreated or partially treated SPL material entering the product stream is therefore considered to be negligible.

However should this occur, the affected material would be identified by quality assurance and control processes and returned to Shed 5 for reprocessing. Quality assurance is achieved by sampling materials on a batch order basis. This ensures that each product batch is assigned a batch quality status prior to it being despatched from the facility.

Production to date has demonstrated that the proposed SPL treatment process is successful in reducing cyanide content to negligible levels, and the flammable gas hazard is eliminated. SDS for end products is provided in **Appendix G**.

The Facility's operational processes do not generate raw SPL material or by-product wastes. SPL material is converted into a saleable product in accordance with Environmentally Hazardous Chemicals Licence #88. All raw materials would be processed at the Facility. SPL materials are currently stored on site within the existing building (Shed 5). SPL would continue to be stored in Shed 5 and treated product would be stored in Shed 6.

### Ancillary Wastes

Ancillary wastes generated by the Project may include minor quantities of oils, metals and packaging. These wastes are incorporated into the Tomago Aluminium smelter waste streams and managed in accordance with the EPA 2014 Waste Classification Guidelines and Waste Management Plan for the Tomago Aluminium smelter site. Following classification, waste is removed by a licenced contractor and transported to licenced waste facility.

Up to 500 tonnes of aluminium metal and steel would be recovered from the 60,000 tonnes of waste material. The metals are traded through the secondary metals industry.

Indicative waste volumes for the Project are outlined in **Table 49** and would be generally consistent with existing operations.

**Table 49 Indicative wastes volumes for the Project**

| Waste classification[1] | Wastes | Indicative volumes (per annum) |
|---|---|---|
| Hazardous waste | SPL Material | 0 tonnes (Up to 60,000tonnes of material processed into saleable product) |
| Restricted solid waste | None | - |
| General solid waste (putrescible) | Food waste, general waste from bins in amenities buildings | Less than 5 tonnes |
| General solid waste (non-putrescible) | Scrap metals | Less than 500 tonnes |
| General solid waste (non-putrescible) | Oils and packaging materials | Less than 5 tonnes |

Note
1: According to EPA 2014 Waste Classification Guidelines

**Waste Avoidance and Resource Recovery Strategy 2010-2021**

The primary goal of the Waste Avoidance and Resource Recovery Strategy 2010-2021 (WARR Strategy) is to enable all of the NSW community to improve environment and community well-being by reducing the environmental impact of waste and using resources more efficiently.

The strategy is a key component of the NSW Government's Waste Less, Recycle More initiative and sets out the following key result areas:

1. Avoid and reduce waste generation.
2. Increase recycling.
3. Divert more waste from landfill.
4. Manage problem wastes better.
5. Reduce litter.
6. Reduce illegal dumping.

The Project would endeavour to meet the abovementioned key result areas given the SPL process would result in material that is detoxified and can be reused in the cement industry. The recycling process would result in the following waste resource recovery benefits:

- Spent Pot Lining is transformed to a product resource;
- There are no residual waste materials associated with the thermal treatment process;
- The Project would contribute to the progressive elimination of SPL accumulated in storage;
- The need to land fill SPL would be avoided; and
- SPL is treated on site at a single facility.

The Project is consistent with objectives of the WARR Strategy to divert more waste from landfill and manage problem wastes better.

### 7.7.3 Mitigation Measures

Waste would continue to be processed and managed in accordance with the measures outlined in **Section 2.3** and **Section 7.7.1**. This would include sampling, testing and analysing the material in each batch in accordance with quality control processes.

The following specific waste management measures would be applied to the Project during operation:

- All construction waste would be classified in accordance with the Waste Classification Guidelines (EPA, 2014) prior to disposal and transported to an appropriately licensed waste disposal facility.
- The site EMP would be reviewed and updated following approval of the Project as modified, if necessary;
- A variation to EPL 13269 would be sought to provide for the revised site layout and emission points following approval of the Project;
- The EHC Licence (#88) would be reviewed following approval of the Project and if required a variation sought to maintain consistency;
- SPL material would be maintained under cover within Shed 5 prior to processing; and
- Exposed treated product would be maintained in a moist condition (but not saturated) or covered with tarpaulins to prevent dust rising. Treated product would be stockpiled within Shed 6.

## 7.8 Other Environmental Issues

Other environmental aspects that were identified in **Section 6.0** as having very low or no anticipated impacts include:

- Visual;
- Heritage;
- Ecology;
- Social and Economic; and
- Cumulative impact.

Consideration of these matters is provided in **Table 50**.

**Table 50 Other environmental issues**

| Issue | Consideration |
|---|---|
| Visual | The Project site would be constructed within the existing facility site boundary, which is located within the industrial smelter complex. Other industrial buildings and an extensive vegetation buffer surround the site screening views from Old Punt Road (approximately 1km north-west from site), Pacific Highway (approximately 1.8km west from site) and Tomago Road (approximately 600 metres south from site). To the north an electrical substation screens views along Old Punt Road (approximately 750 north-west).<br><br>The original 2009 EA considered that the proposed plant elements would be approximately 30m above ground level (at maximum stack height).<br><br>The proposal would adjoin two existing buildings (Shed 5 SPL Preparation building and Shed 6 Product manufacturing building). The Project would involve the installation of an additional thermal treatment plant. The RL of the existing two sheds is approximately 12.5 metres in height and RL height of the additional thermal treatment plant is proposed to be approximately 15 metres (including stack height). The fine grinding plant would be approximately 21m in height.<br><br>Based on the modified plant inventory it is considered that the Project would retain the same physical size and scale of the originally approved Project.<br><br>The Project includes a revised site layout but remains generally consistent with the 2009 EA which identified that thermal treatment and product plant elements would be located between Shed 5 and Shed 6. The change in layout is not considered to negatively impact on the visual amenity of the surrounding landscape.<br><br>Given the proposal is located within an existing industrial area which is obstructed by other industrial buildings, an electrical substation and significant amounts of vegetation, it is expected that the 1.5 metre difference between the RL height of the two existing sheds and the new SPL plant is minimal and as such there would be no visual impacts to surrounding areas. |
| Heritage | The Project would be constructed within the existing SPL Facility site boundary. Given its location within the industrial smelter complex, the site is a highly disturbed site and ground disturbance for the Project would be limited to the area between the two existing sheds. No items of heritage or cultural value would be affected by the Project. |
| Ecology | The Project would be constructed within the existing SPL Facility site, which is located within the existing smelter complex with substantial buffer lands. The Project would not involve the clearing of native vegetation and would not displace or disturb terrestrial or aquatic fauna or create a barrier to fauna |

| Issue | Consideration |
|---|---|
| | movement.<br><br>A buffer zone was designated during the approval process for the third potline at Tomago Aluminium to accommodate an annual emission equivalent to 298 tonnes of total fluoride per year. The load limit is identified as a condition to EPL 6163. A review of NPI reporting years from 2012 to 2017 identified that annual fluoride load ranged between 240 to 280 T/yr with substantial reduction in recent years (towards 240T/yr). The maximum potential Regain contribution to the annual fluoride load on the buffer zone is modelled (based on conservative assumptions) as less than 3 T/yr.<br><br>It should be noted that this is a theoretical worse case value based on Regain operating at their maximum proposed stack EPL concentration limits. It is considered that the small potential increase associated with the proposed Regain operations are unlikely to adversely affect the condition of vegetation in the Botanic Gardens and surrounding areas within the buffer zone.<br><br>An ecosystem monitoring program is conducted around the environs of Tomago Aluminium smelter. The program is designed to trace the pathway of fluoride from its initial release point at the smelter through the various layers of dry sclerophyll forest surrounding the smelter. Results from the 2017 ecosystem monitoring program continue to confirm that fluoride emissions from the smelter yield very localised effects in vegetation with foliar fluoride concentrations decreasing rapidly with distance. It is considered unlikely that the comparatively small potential contribution to annual fluoride loads in the buffer zone (of less than 3T/yr) generated by the Project would significantly affect plant growth, propagation or recovery.<br><br>A small mammal capture program is maintained by Tomago Aluminium Company to consider potential effects that the smelter operation may have on the population dynamics of local small mammals. A review of the program was undertaken in 2015 and determined that, considering 32 years of trapping data, bone fluoride accumulation had not impacted on the abundance or distribution of small mammal species (SMEC, 2015). The review also found that fluoride accumulation at sites located beyond 1.5km did not increase following operation of the smelter.<br><br>These results combined with the comparatively small contributions in annual fluoride loads indicate that it is unlikely that emissions generated by the Project would significantly impact on flora or fauna or their habitats within the buffer lands. No significant impacts to koala feed trees, state or commonwealth listed threatened species or ecological communities are anticipated as a result of the proposed Project (as modified). The proposed Project would not have a significant impact on matters of NES. |
| Social and Economic | The Project is not expected to adversely impact the community or local economy. There would be no change to existing workforce for the operation of the Project and would not increase the requirement for external resources and community services or facilities.<br><br>The Project would have beneficial outcomes for the wider community and economy through the processing of SPL wastes currently stockpiled around Australia and converting these wastes into usable end-products. The reuse options for processed SPL would provide energy savings and reduce the consumption of primary fuel in the brick and cement industries. |
| Cumulative impacts | As the site operates within an existing aluminium smelter cumulative impacts to air quality, human health, traffic and noise have been considered within the |

| Issue | Consideration |
|---|---|
| | relevant sections of this EA (Section 7.1-7.6). No other substantial cumulative impacts are predicted to occur as a result of construction or operation of the Project. |

# 8.0 Statement of Commitments

In accordance with the requirements under the Part 3A (repealed) provisions of the EP&A Act, the following draft Statement of Commitments is provided. Regain commits to the implementation of the environmental management measures detailed in **Table 51** during construction and operation of the proposed modification.

**Table 51 Draft Statement of Commitments**

| Issue | Safeguard |
|---|---|
| General | 1. The Proponent would implement all practicable measures to prevent or minimise harm to the environment that may result from the construction or operation of the Project.<br>2. The Proponent would implement all practicable measures to prevent or minimise harm to the environment that may result from the construction or operation of the Project.<br>3. The Proponent would prepare and implement a Construction Environmental Management Plan (CEMP) to provide environmental management practices and procedures to be followed during the construction phase, particularly in relation to the management of soils, surface waters, air quality, and noise management.<br>4. The Proponent would update a current EMP prepared for the existing site activities.<br>5. The Proponent would operate the facility in accordance with existing EPA pollution control approvals for existing operations at the Tomago smelter.<br>6. The Proponent would operate the facility in accordance with existing EPA Environmental Protection Licences (EPLs) issued for existing operations of the smelter.<br>7. The Proponent would ensure regular inspection, monitoring and auditing is undertaken to maintain effective environmental management and to highlight non-compliance of standards, conditions or licence requirements.<br>8. The Proponent would ensure routine monitoring of air quality, groundwater and surface water is undertaken. Groundwater and surface water monitoring is undertaken in conjunction with the TAC smelter existing monitoring program where appropriate. |
| Air Quality | 1. The Proponent would implement dust mitigation strategies throughout the facility including:<br>- Enclosure of external plant;<br>- Construction of sealed processing and product storage facilities;<br>- Installation of dust extraction systems throughout the processing plant and connected to dust generating activities; and<br>- Installation of visual and audible alarm systems to minimise potential for dust generation in the event of plant / system breakdown or failure.<br>2. The Proponent would ensure residual emissions would be directed to the atmosphere via stacks, as indicated by the proposal.<br>3. The Proponent would implement dust mitigation strategies as part of the CEMP which will include:<br>- Stabilisation of disturbed surfaces during construction;<br>- Removal of excessive soil on construction vehicle tyres; and<br>- Spraying of stockpiled earths / fine construction material during high winds to reduce potential for dust.<br>4. The Proponent would maintain processing plant and Shed 5 under negative pressure, treated products would be maintained in a moist condition, to mitigate fugitive emissions.<br>5. The Proponent would control SPL processing stages to destroy cyanide and hazardous gases. |

| Issue | Safeguard |
|---|---|
| | 6. The Proponent would control the thermal treatment process (i.e. maintain the temperature below 850$^{o}$C) to minimise liberation of gaseous fluoride.<br>7. The Proponent would operate baghouse dust collectors to minimise emissions of particulate matter and particulate-bound contaminants.<br>8. The Proponent would apply appropriate housekeeping practices to minimise dust generation from concrete apron areas. |
| Hazard and Risk | 1. The Proponent would prepare and implement a Safety Management System (SMS) for the SPL plant to include elements of the operations, maintenance and management of the facility. The SMS would be developed in accordance with the guidelines issued by the Department of Planning in Hazardous Industry Planning Advisory Paper No.9, "Guidelines for Safety Management Systems".<br>2. The Proponent would install the following systems within the SMS:<br>- A kiln temperature monitoring and calibration procedure to ensure the temperature control system of the kiln is operated using correct data and information;<br>- A burner management system designed in accordance with AS1853 ("Automatic Oil and Gas Burners: Mechanical Draught", Standards Association of Australia, Sydney, 1983);<br>- A pressure management and monitoring / alarm system for dust extraction equipment; and<br>- A temperature management and alarm system in the baghouse.<br>3. The Proponent would construct the SPL facility so that it incorporates:<br>- Bunding of truck loading areas to prevent potential contamination of nearby drains and stormwater run-off channels;<br>- The rotary kiln would be fitted with blast panels to minimise the potential for explosion damage to the kiln shell; and<br>- An interlock would be fitted to the water supply system and induction fan. |
| Human Health | 1. The environmental controls as listed in **Section 2.4** of this EA would be implemented. |
| Traffic and Transport | 1. Operate in accordance with the Road Transport Act 2013.<br>2. Construction vehicles carrying loose materials to and from the site would be covered after loading (prior to traversing public roads) to prevent wind-blown dust emissions and spillages.<br>3. In the event of a spillage of materials from construction vehicles onto a public road, the RMS & EPA would be notified and the spilled material would be removed.<br>4. Construction traffic would only traverse those public roads as outlined in the EA, which are public roads that are suitable for heavy vehicles.<br>5. Additionally, adequate on-site parking would be provided for construction traffic so that no construction vehicles would be parked on the surrounding road network.<br>The following specific traffic mitigation measures would be applied to the Project during operation:<br>• Site access procedures including the proposed haulage route would be communicated to site personnel and heavy vehicle operators.<br>• Trucks would ensure loads are appropriately covered and sealed to protect transported material from wind and rain. |
| Noise and Vibration | 1. The Proponent would implement noise mitigation strategies to achieve the following:<br>- Operational noise levels are maintained at 10 dB(A) below the existing Leq noise level of the smelter; and<br>- The L1 (1 min) level of any specific noise source would not exceed the background noise level (L90) by more than 15 dB(A) when |

| Issue | Safeguard |
|---|---|
| | measured outside the bedroom window of the nearest residential receiver (in accordance with DECC's Environmental Noise Control Manual).<br>2. The Proponent would implement noise mitigation strategies in the CEMP, including but not limited to the following:<br>- Unless otherwise agreed by DECC, construction activity, likely to impact on sensitive receivers, would only occur during the period:<br>▪ 7.00am to 6.00pm Monday to Friday;<br>▪ 8.00am to 1.00pm Saturday; and<br>▪ No work on Sundays or public holidays.<br>3. Construction noise shall not exceed 5 dB above background levels (as prescribed by EPA Environmental Noise Control Manual criteria). |
| Waste | 1. All construction waste would be classified in accordance with the Waste Classification Guidelines (EPA, 2014) prior to disposal and transported to an appropriately licensed waste disposal facility.<br>2. The site EMP would be reviewed and updated following approval of the Project as modified, if necessary.<br>3. A variation to EPL 13269 would be sought to provide for the revised site layout and emission points following approval of the Project.<br>4. The EHC Licence (#88) would be reviewed following approval of the Project and if required a variation sought to maintain consistency.<br>5. SPL material would be maintained under cover within Shed 5 prior to processing.<br>6. Exposed treated product would be maintained in a moist condition to prevent dust rising. Treated product would be stockpiled within Shed 6. |
| Water and Soil | 1. The Stormwater Management Plan would be reviewed and updated to accompany the modified Project<br>2. The Proponent shall implement all practicable measures to minimise the discharge of sediments, contaminants and pollutants to surface and ground water as a result of the operation of the facility.<br>3. The Proponent shall ensure that all drains and stormwater channels outside the SPL bunded area are directed to the existing site first flush pond.<br>4. The Proponent shall ensure there is no outside truck loading in the SPL facility during rain periods.<br>5. The Proponent shall implement ground water and surface water quality management strategies in the CEMP. |

This page has been left blank intentionally.

# 9.0 Conclusion

This EA presents details of the proposed modification, assesses the potential impacts on the environment and local community, and identifies management measures to minimise or avoid the identified impacts.

The Project is for the modification of the existing Part 3A Approval (06_0050) for the Tomago SPL Processing Facility (the Facility). Modification of the existing approval is proposed to provide for:

- **Plant modifications:** Opportunities have been identified to enhance the operational efficiency of the existing facility by altering the originally proposed site layout and key plant components; and
- **Facility production increase:** To ensure operational efficiencies and for Regain to meet market demand, modification is sought to increase current production from 20,000tpa to 60,000tpa.

The Project is to modify the existing SPL processing facility on site at Tomago Aluminium smelter which reduces the hazardous nature of a waste material through thermal treatment thereby recycling a waste material into a useable end-product.

The end-product HiCAl provides substantial reductions in Scope 3 Greenhouse Gas Emissions within the cement industry by providing a three times greater reduction in $CO_{2\text{-}e}$ emissions of approximately 138,300 $CO_{2\text{-}e}$ (tonnes) based on current lifecycle analysis.

To reach the target throughput capacity of 60,000tpa it is proposed to operate an optimised configuration utilising the thermal treatment process elements of both the existing approved Project and an additional thermal treatment plant. Air quality, hazard and risk investigations, along with the assessment of other environmental factors undertaken as part of this EA predicted that the potential impacts of the Project would not be significant and would be generally minor. With the implementation of the mitigation measures proposed, it is expected that impacts would be eliminated or minimised and the Project would be able to operate with acceptable environmental outcomes.

It is considered that the environmental effects and the risk profile of the total Project (the existing approved Project as modified) would not be significantly changed from the existing approved Project.

This page has been left blank intentionally.

Email: Susan.Fox@planning.nsw.gov.au

Our ref: MP06_0050 (MOD 2)

Mr Kevin Cooper
NSW Regional Manager
Regain Services Pty Ltd
PO BOX 1280
NEWCASTLE NSW 2300

Dear Mr Cooper

**Spent Potlining Recycling Facility, Tomago (MP 06-0050) (MOD 2)**
**Section 75W Modification - Environmental Assessment Requirements**

I refer to the correspondence received by the Department of Planning and Environment (the Department) dated 18 August 2017 from AECOM on behalf of Regain Services Pty Ltd (Regain). I also refer to the additional information on hazards and risks received by the Department on 28 November 2017. The correspondence was in relation to a variation to the proposed project at the Spent Potlining Recycling Facility, Tomago. The correspondence also sought clarification from the Department regarding the approval pathway for the proposed modification approval MP 06-0050 (Mod 2)

The Department has reviewed the correspondence and advises that a modification of the proposed project approval MP 06_0050 (Mod 1) for the Tomago Spent Potlining Facility can be requested under section 75W of the *Environmental Planning and Assessment Act 1979* (the Act).

Based on the information provided to date, the Department has issued new Environmental Assessment Requirements (EARs) to reflect the proposed changes to the project (see **Attachment 1** and **Attachment 2**).

Your modification request must be accompanied by an Environmental Assessment (EA). The Department strongly recommends that you consult with all relevant public authorities prior to submitting your modification request and EA including but not limited to Port Stephens Council, NSW Health, Roads and Maritime Services, Fire and Rescue NSW, SafeWork NSW, Office of Environment and Heritage and the Environment Protection Authority. The purpose of consultation is to ensure that all environmental impacts of the modification are assessed and to minimise delays at the assessment stage.

It is requested that prior to lodging the modification request, a draft EA is emailed to the Department for review.

Following the lodgement of the EA, the Department will advise you of the applicable fee (under Division 1A, Part 15 of the *Environmental Planning and Assessment Regulation, 2000*) and consultation requirements.

If you have any further questions in relation to this matter please contact Susan Fox on 9274 6466 or susan.fox@planning.nsw.gov.au.

Yours sincerely

Chris Ritchie 20/12/17.

**Industry Assessments**

**Encl.:** **Attachment 1:** Environmental Assessment Requirements
**Attachment 2:** Technical and Policy Guidelines

| ATTACHMENT 1<br>**Environmental Assessment Requirements** | |
|---|---|
| **Application Number** | MP 06_0050 (Mod 2) |
| **Development** | Increase the throughput capacity of Spent Potliner (SPL) from 20,000 tpa to 60,000 tpa and modification to the site layout including an additional emission point |
| **Location** | Tomago Road, Tomago Lots 15 and 16 in DP 258020 |
| **Applicant** | Regain Services Pty Ltd |
| **Date of Issue** | November 2017 |
| **General Requirements** | The EA must include a:<br>• detailed description of the development, including:<br>– existing operations carried out on the site and how the site operates lawfully under the *Environmental Planning and Assessment Act 1979* (EP&A Act) including any reliance on existing use rights and/or planning approvals and how these will be consolidated<br>– accurate history of the site, including development consents<br>– need for the proposed development<br>– justification for the proposed development<br>– likely staging of the development - including demolition, construction, and operational stage/s<br>– likely interactions between the development and existing, approved and proposed operations in the vicinity of the site<br>– plans of any proposed building works<br>– contributions required to offset the proposal<br>– Identification of conditions to be modified.<br>• consideration of all relevant environmental planning instruments, including identification and justification of any inconsistencies with these instruments<br>• risk assessment of the potential environmental impacts of the development, identifying the key issues for further assessment<br>• detailed assessment of the key issues specified below, and any other significant issues identified in this risk assessment, which includes:<br>• a description of the existing environment, using sufficient baseline data<br>• an assessment of the potential impacts of all stages of the development, including any cumulative impacts, taking into consideration relevant guidelines, policies, plans and statutes<br>• a description of the measures that would be implemented to avoid, minimise and if necessary, offset the potential impacts of the development, including proposals for adaptive management and/or contingency plans to manage any significant risks to the environment<br>• a consolidated summary of all the proposed environmental management and monitoring measures, highlighting commitments included in the EA. |
| **Key issues** | The EA must address the following specific matters:<br>• **Waste Management** – including:<br>• a description of the waste streams that would be accepted at the site including the maximum daily, weekly and annual throughputs<br>• details of the source of the waste streams to justify the need for the proposed processing capacity<br>• a description of waste processing operations, including a description of the technology to be installed, resource outputs, and the quality control measures that would be implemented<br>• details of where SPL will be sourced from<br>• details of how waste would be stored and handled on site, and transported to and from the site including details of how the receipt of non-conforming waste would be dealt with<br>• the measures that would be implemented to ensure that the development is consistent with the aims, objectives and guidance in the *NSW Waste Avoidance and Resource Recovery Strategy 2014-2021*.<br>• **Soil and Water** – including:<br>• an assessment of potential impacts to soil and water resources, topography, hydrology, drainage lines, watercourses and riparian lands on or nearby to the site<br>• a detailed site water balance |

| | |
|---|---|
| | • any works with the potential to intercept the groundwater table<br>• details of stormwater/wastewater/leachate management systems including the capacity of onsite detention systems, and measures to treat, reuse or dispose of water<br>• characterisation of the nature and extent of any contamination on the site and a description of proposed management measures.<br>• **Air Quality and Odour** – including:<br>• a quantitative assessment of the potential air quality, dust and odour impacts of the development in accordance with relevant Environment Protection Authority guidelines<br>• the details of buildings and air handling systems and strong justification for any material handling, processing or stockpiling external to a building<br>• an justification for the substantial difference the 2009 and 2017 air dispersion modelling results<br>• a greenhouse gas assessment<br>• details of proposed mitigation, management and monitoring measures.<br>• **Noise and Vibration – including:**<br>• a quantitative assessment of potential demolition, construction, operational and transport noise and vibration impacts in accordance with relevant Environment Protection Authority guidelines<br>• an assessment of the predicted transport noise and vibration impacts and justification of proposed transport routes and times<br>• details and justification of the proposed noise mitigation and monitoring measures.<br>• **Traffic and Transport – including:**<br>• details of all traffic types and volumes likely to be generated during construction and operation, including a description of haul routes<br>• an assessment of the predicted impacts of this traffic on road safety and the capacity of the road network, including consideration of cumulative traffic impacts at key intersections using SIDRA or similar traffic model<br>• detailed plans of the proposed layout of the internal road network and parking on site in accordance with the relevant Australian Standards<br>• plans of any proposed road upgrades, infrastructure works or new roads required for the development<br>• turning path diagrams depicting vehicles entering, exiting and manoeuvring throughout the site.<br>• **Human Health Risk** – including:<br>• an assessment of the potential human health risks (on site and off site) associated with the processing of SPL and<br>• details of mitigation and management measures to minimise human health risks and ensure the safety of workers during the development<br>• **Hazards and Risks** – The environmental assessment must include a Preliminary Hazard Analysis (PHA) for the modification, prepared in accordance with *Hazardous Industry Planning Advisory Paper No. 6 'Hazard Analysis'* (Department of Planning, 2011) and *Multi-Level Risk Assessment* (Department of Planning, 2011). The PHA must:<br>○ identify the hazards and safeguards for the modification<br>○ include a cumulative risk assessment, covering the simultaneous operation of the existing 20,000 tonnes per annum demonstration plant and the proposed 40,000 tonnes per annum combination drying and thermal treatment plant.<br>• **Sensitive Receivers** – including consideration of potential impacts, particularly noise and air quality.<br>• **Visual** – including an assessment of the potential visual impacts of the project on the amenity of the surrounding area. |
| **Consultation** | During the preparation of the EA, you must consult with the relevant local, State or Commonwealth Government authorities, service providers, community groups and potentially affected landowners. In particular you must consult with:<br>• Port Stephens Council<br>• Environment Protection Authority<br>• Office and Environment and Heritage<br>• Sydney Water<br>• SafeWork NSW<br>• Hunter New England Local Health District<br>• Roads and Maritime Services<br>• Fire and Rescue NSW<br>• nearby land owners and occupiers that may be affected by the proposal.<br>The EA must describe the consultation process and the issues raised, and identify |

| | |
|---|---|
| | where the design of the development has been amended in response to these issues. Where amendments have not been made to address an issue, a short explanation should be provided. |
| **References** | The assessment of the key issues listed above must take into account relevant guidelines, policies, and plans as identified. While not exhaustive, the following attachment contains a list of some of the guidelines, policies, and plans that may be relevant to the environmental assessment of this development. |

**ATTACHMENT 2**
**Technical and Policy Guidelines**

The following guidelines may assist in the preparation of the Environmental Impact Statement. This list is not exhaustive and not all of these guidelines may be relevant to your proposal.

# Policies, Guidelines & Plans

## Plans and Documents

The EA must include all relevant plans, architectural drawings, diagrams and relevant documentation required under Schedule 1 of the Environmental Planning and Assessment Regulation 2000. Provide these as part of the EA rather than as separate documents.

In addition, the EA must include the following:

1. An existing site survey plan drawn at an appropriate scale illustrating:
- the location of the land, boundary measurements, area (sq. m) and north point
- the existing levels of the land in relation to buildings and roads
- location and height of existing structures on the site
- location and height of adjacent buildings and private open space
- all levels to be to Australian Height Datum (AHD).

2. A locality/context plan drawn at an appropriate scale should be submitted indicating:
- watercourses including nearby rivers and creeks, and dams
- significant local features such as heritage items
- the location and uses of nearby buildings, shopping and employment areas, hospitals and schools and
- traffic and road patterns, pedestrian routes and public transport nodes.

3. An indication of the location of the site with respect to the relevant Land Zoning Map within the *Port Stephens Local Environment Plan 2013*

4. Drawings at an appropriate scale illustrating:
- detailed plans, sections and elevations of the existing building, which clearly show all proposed internal and external alterations and additions.

### Documents to be submitted

Documents to submit include:
- 1 electronic copy of all the documents and plans for review prior to exhibition and
- other copies as determined by the Department once the development application is lodged.

## Technical and Policy Guidelines

The following guidelines may assist in the preparation of the Environmental Impact Statement. This list is not exhaustive and not all of these guidelines may be relevant to your proposal.

Many of these documents can be found on the following websites:

## Project Approval

# Appendix B Project Approval

# Project Approval

## Section 75J of the *Environmental Planning and Assessment Act 1979*

Under the Minister for Planning's delegation of 4 March 2009, I approve the project referred to in Schedule 1, subject to the conditions in Schedules 1 to 4.

These conditions are required to:

- prevent, minimise, and/or offset adverse environmental impacts;
- set standards and performance measures for acceptable environmental performance;
- require regular monitoring and reporting; and
- provide for the ongoing environmental management of the project.

S Haddad

Sam Haddad
**Director-General**
**as delegate of the Minister for Planning**

Sydney 7th August 2009

---

**SCHEDULE 1**

| | |
|---|---|
| **Application Number:** | 06_0050 |
| **Proponent:** | Regain Services Pty Ltd |
| **Approval Authority:** | Minister for Planning |
| **Land:** | Lots 15 and 16 in DP 258020, Tomago Road, Tomago |
| **Project:** | Spent Potlining Recycling Facility |

## TABLE OF CONTENTS

## DEFINITIONS

| | |
|---|---|
| BCA | Building Code of Australia |
| Council | Port Stephens Council |
| DECC | Department of Environment and Climate Change |
| Department | Department of Planning |
| Director-General | Director-General of Department of Planning, or delegate |
| EA | Environmental Assessment titled *"Construction and Operation of a Spent Potliner Processing Facility, Tomago", dated 1 May 2009 and prepared by ENSR Australia Pty Ltd* |
| EP&A Act | *Environmental Planning and Assessment Act 1979* |
| EP&A Regulation | *Environmental Planning and Assessment Regulation 2000* |
| EPL | Environment Protection Licence |
| Hydro Aluminium Smelter | Hydro Aluminium Kurri Kurri Pty Ltd, Hart Road, Loxford, NSW |
| Minister | Minister for Planning, or delegate |
| Project | The development as described in the EA |
| Proponent | Regain Services Pty Ltd |
| Reasonable and Feasible | Reasonable relates to the application of judgement in arriving at a decision, taking into account: mitigation benefits, cost of mitigation versus benefits provided, community views and the nature and extent of potential improvements. Feasible relates to engineering considerations and what is practical to build. |
| Recycling Facility | The SPL Recycling Facility at the Tomago Aluminium Smelter |
| Site | The land referred to in Schedule 1 |
| SPL | Spent Potlining |
| Statement of Commitments | The Proponent's commitments contained within in the EA |
| TAC | Tomago Aluminium Company Pty Ltd |
| Thermal Treatment Plant | The thermal process plant whereby cyanide and flammable gas would be neutralised. Valuable materials such as carbon and fluorides would be retained. The Thermal Treatment Plant is not within a covered building. |

## SCHEDULE 2
## ADMINISTRATIVE CONDITIONS

### Obligation to Minimise Harm to the Environment

1. The Proponent shall implement all reasonable and feasible measures to prevent and/or minimise any harm to the environment that may result from the construction and/or operation of the project.

### Terms of Approval

2. The Proponent shall carry out the project generally in accordance with the:
   a) EA;
   b) site plan in Appendix A;
   c) statement of commitments; and
   d) conditions of this approval.

3. If there is any inconsistency between the above, the conditions of this approval shall prevail to the extent of any inconsistency.

4. The Proponent shall comply with any reasonable requirement/s of the Director-General arising from the Department's assessment of:
   - any reports, plans, strategies, programs or correspondence that are submitted in accordance with this approval; and
   - the implementation of any actions or measures contained in these reports, plans, strategies, programs or correspondence.

### Limits on Approval

5. The Proponent shall not process more than a total of 20,000 tonnes per annum (tpa) of SPL waste classified as hazardous or restricted solid waste from the Tomago Aluminium Smelter and the Hydro Aluminium Smelter collectively.

6. The SPL Recycling Facility shall recycle SPL into non-hazardous waste or a useable product.

### Management Plans

7. With the approval of the Director-General, the Proponent may submit any management plan required by this approval on a progressive basis.

### Structural Adequacy

8. The Proponent shall ensure that all new buildings and structures on the site are constructed in accordance with the relevant requirements of the BCA.

   *Notes:*
   - *Under Part 4A of the EP&A Act, the Proponent is required to obtain construction and occupation certificates for the proposed building works.*
   - *Part 8 of the EP&A Regulation sets out the requirements for the certification of the project.*

9. Prior to the construction of any utility works, the Proponent shall obtain the relevant approvals from service providers, including Hunter Water.

### Operation of Plant and Equipment

10. The Proponent shall ensure that all plant and equipment used on the site is:
    - maintained in a proper and efficient condition; and
    - operated in a proper and efficient manner.

## SCHEDULE 3
## SPECIFIC ENVIRONMENTAL CONDITIONS

### SOIL AND WATER

#### Discharges

11. The Proponent shall comply with Section 120 of the *Protection of the Environment Operations Act 1997*.

12. All SPL waste must be stored and processed under cover or within the thermal treatment plant.

#### Bunding

13. All chemicals, fuels and oils shall be stored in appropriately bunded areas, with impervious flooring and sufficient capacity to contain 110% of the largest container stored within the bund. The bund(s) shall be designed and installed in accordance with:
    - the requirements of all relevant Australian Standards; and
    - the DECC's *Storing and Handling Liquids: Environmental Protection, Participants Manual.*

#### Erosion and Sediment Control

14. Erosion and sediment control at the site during construction shall be consistent with the requirements of *Landcom's (2004) Managing Urban Stormwater: Soils and Construction* manual.

#### Stormwater Management Plan

15. The Proponent shall prepare and implement a Stormwater Management Plan for the project to the satisfaction of the Director-General. This plan must:
    (a) be submitted to the Director-General for approval prior to construction;
    (b) be prepared by a suitably qualified and experienced person in consultation with Council; and:
        - include details of erosion and sediment control during construction;
        - include detailed plans of the stormwater management system for the project;
        - ensure the SPL facility is constructed so that the truck loading areas are bunded to prevent potential contamination of nearby stormwater drains;
        - describe the storage areas for SPL including details of how SPL will be kept dry and secure (to ensure protection of the groundwater); and
        - describe the procedures for the installation, inspection and maintenance of the stormwater system;
        - describe the monitoring that occurs at the site which would detect any discharges that may affect water quality.

### HAZARDS

16. Prior to commissioning of the new SPL facility, the Proponent shall develop and implement a comprehensive Safety Management System (SMS) for the project to the satisfaction of the Director-General. The SMS shall incorporate the recommendations in section 10.4 of the EA. The SMS shall be consistent with the Department of Planning's *Hazardous Industry Planning Advisory Paper No. 9, 'Safety Management'*.

### AIR

#### Air Quality Monitoring and Criteria

17. The Proponent shall carry out all reasonable and feasible measures to minimise dust generated by the project.

18. The Applicant shall undertake air emission monitoring as required by the EPL, and shall ensure that the project meets the air quality impact assessment criteria outlined in the EPL.

19. Within nine months of the commencement of operations, the Proponent shall prepare and submit an Air Quality Verification Report to the satisfaction of the Director-General and the DECC. The Air Quality Verification Report shall include:
    i) monitoring data required by the EPL;
    ii) copies of all analytical test reports for all substances sampled and tested;
    iii) comparison of monitoring results with the predictions outlined in the EA and with any limits or conditions in the EPL; and

iv) if necessary, additional measures that would be implemented to comply with the requirements of the EPL.

## NOISE

### *Construction*

20. The Proponent shall comply with the restrictions in Table 1, unless otherwise agreed by the Director-General.

*Table 1: Construction and Operation Hours for the Project*

| Activity | Day | Time |
|---|---|---|
| Construction | Monday – Friday | 7:00am to 6:00pm |
| | Saturday | 8:00am to 1:00pm |
| | Sunday and Public Holidays | Nil |
| Operation | All days | Any time |

*Note: Construction activities may be conducted outside the hours in Table 1 provided that the activities are not audible at any residence beyond the boundary of the site.*

### *Noise Limits*

21. The Proponent shall ensure that the noise from the operation of the project does not exceed the noise limits presented in Table 2.

*Table 2: Project Noise Limits (dB(A))*

| Location | Day/Evening/Night | Night |
|---|---|---|
| | | dBA $L_{A1\ (1\ minute)}$ |
| Residences on Tomago Road | 35<br>dBA $L_{Aeq\ (15\ minute)}$ | 45 |
| Industrial receivers | 70<br>dBA $L_{Aeq}$ | 70 |

*Notes:*

*a) The noise emission limits identified in the above table apply under meteorological conditions of:*
- *wind speeds of up to 3 m/s at 10 metres above ground level; and*
- *temperature inversion conditions of up to 3°C/100m, and wind speeds of up to 2 m/s at 10 metres above ground level.*

## TRANSPORT

22. At all times the Proponent shall ensure that:
- all trucks entering or leaving the site with loads have their loads covered;
- trucks associated with the project do not track dirt onto the public road network; and
- the public roads used by these trucks are kept clean of any Regain products or materials.

23. The Proponent shall ensure that:
- all parking generated by the project is accommodated on site, and that no vehicles associated with the project shall park on the public road system at any stage;
- that the project does not result in any vehicles queuing on the public road network;
- vehicles associated with the project are operated at low speed or power within the TAC site and are turned off when not being used; and
- vehicles are not to be left idling for prolonged periods.

## WASTE

24. The Proponent shall ensure that waste would be reused, recycled, and if necessary, appropriately treated and disposed of in accordance with the DECC's *Waste Classification Guidelines.*

## VISUAL

### Lighting

25. The Proponent shall ensure that the lighting associated with the project:
    a) complies with the latest version of Australian Standard *AS 4282(INT)-Control of Obtrusive Effects of Outdoor Lighting*; and
    b) is mounted, screened and directed in such a manner that it does not create a nuisance to surrounding properties or the public road network.

## SCHEDULE 4
## ENVIRONMENTAL MANAGEMENT REPORTING AND AUDITING

### ENVIRONMENTAL MANAGEMENT STRATEGY

26. The Proponent shall prepare and implement an Environmental Management Strategy for the project to the satisfaction of the Director-General. This strategy must be submitted to the Director-General prior to carrying out any development on site, and:
    a) provide the strategic context for environmental management of the project;
    b) identify the statutory requirements that apply to the project;
    c) describe in general how the environmental performance of the project would be monitored and managed;
    d) describe the procedures that would be implemented to:
        - keep the local community and relevant agencies informed about the operation and environmental performance of the project;
        - receive, handle, respond to, and record complaints;
        - resolve any disputes that may arise during the course of the project;
        - respond to any non-compliance;
        - manage cumulative impacts; and
        - respond to emergencies; and
    e) describe the role, responsibility, authority, and accountability of all the key personnel involved in environmental management of the project.

### ENVIRONMENTAL REPORTING

#### Incidents

27. Within 24 hours of detecting an exceedance of the limits/performance criteria in this approval or the occurrence of an incident that causes (or may cause) harm to the environment, the Proponent shall notify the Department and other relevant agencies of the exceedance/incident.

28. Within 6 days of notifying the Department and other relevant agencies of an exceedance/incident, the Proponent shall provide the Department and these agencies with a written report that:
    - describes the date, time, and nature of the exceedance/incident;
    - identifies the cause (or likely cause ) of the exceedance/incident;
    - describes what action has been taken to date; and
    - describes the proposed measures to address the exceedance/incident.

#### Independent Environmental Audit

29. Within 2 years of this approval, and every 3 years thereafter, unless the Director-General directs otherwise, the Proponent shall commission and pay the full cost of an Independent Environmental Audit of the project. This audit must:
    (a) be conducted by a suitably qualified, experienced, and independent team of experts whose appointment has been endorsed by the Director-General;
    (b) assess the environmental performance of the project, and its effects on the surrounding environment;
    (c) assess whether the project is complying with the relevant standards, performance measures, and statutory requirements;
    (d) review the adequacy of any strategy/plan/program required under this approval; and, if necessary,
    (e) recommend measures or actions to improve the environmental performance of the project, and/or any strategy/plan/program required under this approval.

30. Within 3 months of submitting the audit report to the Director-General, the Proponent shall review and if necessary revise the strategies/plans/programs required under this approval, to the satisfaction of the Director-General.

# Notice of Modification

## Section 75W of the *Environmental Planning & Assessment Act 1979*

As delegate of the Minister for Planning under delegation dated 16 February 2015, I modify the Project Approval referred to in Schedule 1, subject to the conditions in Schedule 2.

Chris Ritchie
**Director**
**Industry Assessments**

Sydney 16 NOVEMBER 2016

**SCHEDULE 1**

| | |
|---|---|
| **Development Approval:** | **MP 06_0050** (granted by the then Minister for Planning on 7 August 2009) |
| **For the following:** | Spent Potlining Recycling Facility at Tomago Road, Tomago |
| **Proponent:** | Regain Services Pty Ltd |
| **Approval Authority:** | Minister for Planning |
| **Land:** | Lots 15 and 16 in DP 258020 |
| **Modification:** | **MP 06_0050 MOD 1**: remove the restrictions on the source supplier of spent potliner (SPL) waste. |

**SCHEDULE 2**

The above approval is modified as follows:

(a) Delete Condition 2 of Schedule 2 and replace with:

2. The Proponent shall carry out the project in accordance with the
   a) EA;
   b) site plan in Appendix A;
   c) statement of commitments;
   d) modification proposal MP 06_0050 Mod 1; and

(b) Delete Condition 5 of Schedule 2 and replace with:

5. The Proponent shall not process more than a total of 20,000 tonnes per annum (tpa) of SPL waste classified as hazardous or restricted solid waste.

**End of Modification**

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

| | |
|---|---|
| World Heritage Properties: | None |
| National Heritage Places: | None |
| Wetlands of International Importance: | 1 |
| Great Barrier Reef Marine Park: | None |
| Commonwealth Marine Area: | None |
| Listed Threatened Ecological Communities: | 4 |
| Listed Threatened Species: | 68 |
| Listed Migratory Species: | 62 |

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at http://www.environment.gov.au/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

# Details

## Matters of National Environmental Significance

### Wetlands of International Importance (Ramsar) [ Resource Information ]

| Name | Proximity |
|---|---|
| Hunter estuary wetlands | Within Ramsar site |

### Listed Threatened Ecological Communities [ Resource Information ]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

| Name | Status | Type of Presence |
|---|---|---|
| Central Hunter Valley eucalypt forest and woodland | Critically Endangered | Community may occur within area |
| Coastal Swamp Oak (Casuarina glauca) Forest of New South Wales and South East Queensland ecological community | Endangered | Community likely to occur within area |
| Lowland Rainforest of Subtropical Australia | Critically Endangered | Community may occur within area |
| Subtropical and Temperate Coastal Saltmarsh | Vulnerable | Community likely to occur within area |

### Listed Threatened Species [ Resource Information ]

| Name | Status | Type of Presence |
|---|---|---|
| Birds | | |
| Anthochaera phrygia<br>Regent Honeyeater [82338] | Critically Endangered | Foraging, feeding or related behaviour likely to occur within area |
| Botaurus poiciloptilus<br>Australasian Bittern [1001] | Endangered | Species or species habitat known to occur within area |
| Calidris canutus<br>Red Knot, Knot [855] | Endangered | Species or species habitat known to occur within area |
| Calidris ferruginea<br>Curlew Sandpiper [856] | Critically Endangered | Species or species habitat known to occur within area |
| Calidris tenuirostris<br>Great Knot [862] | Critically Endangered | Roosting known to occur within area |
| Charadrius leschenaultii<br>Greater Sand Plover, Large Sand Plover [877] | Vulnerable | Roosting known to occur within area |
| Charadrius mongolus<br>Lesser Sand Plover, Mongolian Plover [879] | Endangered | Roosting known to occur within area |
| Dasyornis brachypterus<br>Eastern Bristlebird [533] | Endangered | Species or species habitat likely to occur within area |
| Diomedea antipodensis<br>Antipodean Albatross [64458] | Vulnerable | Foraging, feeding or related behaviour likely to occur within area |

| Name | Status | Type of Presence |
|---|---|---|
| Diomedea antipodensis  gibsoni<br>Gibson's Albatross [82270] | Vulnerable | Foraging, feeding or related behaviour likely to occur within area |

## Other Matters Protected by the EPBC Act

### Commonwealth Land [ Resource Information ]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

## Invasive Species

[ Resource Information ]

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resouces Audit, 2001.

| Name | Status | Type of Presence |

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods.  Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc).  In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

# 1.0 Introduction

## 1.1 Project Overview

AECOM Australia Pty Ltd (AECOM) was commissioned by Regain Services Pty Ltd (Regain) to undertake an Air Quality Impact Assessment (AQIA) for the proposed capacity increase at their Tomago facility located within the Tomago Aluminium site.

The AQIA supports the Environmental Assessment prepared by AECOM as part of an application to modify Project Approval 06_0050 under the *Environmental Planning and Assessment Act 1979* (EP&A Act). The project includes consideration and assessment of the proposed increase in Spent Pot Lining (SPL) processing capacity from 20,000 tonnes to 60,000 tonnes per annum at the Regain Tomago SPL recycling facility (herein referred to as 'the Project'). The proposed modification includes:

- Retaining the existing 20,000 tpa plant and installation of the previously approved 40,000 tpa rotary drum kiln;
- Installation of the previously approved SPL Processing Shed 5 dust collector and associated emission point;
- Installation of the previously approved Drying plant dust collector and associated emission point;
- Installation of a new fine grinding plant and associated emission points; and
- Revising the previously approved site layout to accommodate the revised plant configuration.

## 1.2 Scope of Work

The assessment was undertaken in accordance with the NSW Environment Protection Authority (EPA) *Approved Methods for the Modelling and Assessment of Air Pollutants in NSW* (Approved Methods) (EPA, 2017). The assessment considered the following pertinent information:

- The Newcastle air shed background pollutant concentrations; and
- The proposed operational parameters and emissions for the Regain Tomago facility whilst operating at the proposed maximum pollutant concentration limits (based on those currently listed in Environment Protection Licence (EPL) No. 13269).

Predicted emission rates associated with increased processing capacity of 60,000 tpa at the Regain Tomago facility were estimated based on historical stack emissions testing parameters obtained from Regain facilities operated at Tomago, Kurri Kurri and Point Henry. Air emissions were modelled using the CALPUFF dispersion model in accordance with the Approved Methods (EPA, 2017).

## 1.3 Secretary's Environmental Assessment Requirements

In preparing this AQIA, consideration has been given to the NSW Department of Planning and Environment (DP&E) Secretary's Environmental Assessment Requirements (SEARs) issued for the proposed modification (06_0050 MOD 2) on 7 November 2017. Key matters raised by the Secretary, and where this report addresses them, are outlined in **Table 1**.

**Table 1 Secretary's Environmental Assessment Requirements (as relevant to this AQIA)**

| Secretary's Environmental Assessment Requirements | Section Addressed |
|---|---|
| A quantitative assessment of the potential air quality, dust and odour impacts of the development in accordance with relevant Environment Protection Authority guidelines. | **Section 4.0** and **Section 7.0** |
| The details of buildings and air handling systems and strong justification for any material handling, processing or stockpiling external to a building. | **Section 2.0** |
| Justification for the substantial difference between the 2009 & 2017 air dispersion modelling results. | **Section 4.1** and **Section 7.2** |
| Details of proposed mitigation, management and monitoring measures. | **Section 9.0** |
| A greenhouse gas assessment. | **Section 10.0** |

## 1.4 Structure of Report

This AQIA has been completed to provide the DP&E and EPA with sufficient data to support the Project and has been structured as indicated in **Table 2**.

**Table 2 Structure of Report**

| Section | Brief |
|---|---|
| Section 1 | Assessment overview. |
| Section 2 | Provides a description of the Project and the potential air quality impact sources. |
| Section 3 | Provides the regulatory context for which this project has been assessed against. |
| Section 4 | Describes the existing environment including background air quality details, local meteorology, terrain and land use information. |
| Section 5 | Provides a detailed description of the air quality assessment methodology. |
| Section 6 | Provides a detailed description of the CALPUFF model inputs adopted for the assessment. |
| Section 7 | Provides an assessment of the potential air quality impacts of the Project on the local air shed and provides assessment of relevant criteria against identified sensitive receptors. |
| Section 8 | Describes the mitigation measures that are currently used at the facility which will also be implemented for new plant installed as part of the modification. |
| Section 9 | Greenhouse gas assessment (Scope 1 & 2) and potential impacts as a result of the Project. |
| Section 10 | Provides the study conclusions. |

# 2.0 Project Description

It is understood from discussions between Regain and AECOM that Regain want to assess the ground level concentration impacts associated with increasing the production capacity of the Regain Tomago facility, located within the Tomago Aluminium site. Regain currently hold approval to process 20,000 tpa of Spent Pot Lining (SPL) from the Tomago Aluminium smelter and are seeking planning approval from DP&E to increase their processing capacity to 60,000 tpa.

## 2.1 Project Location

The SPL processing facility is located within the existing Tomago Aluminium smelter site – a 500 hectare site located on the NSW east coast around 13 km northwest of the central business district of Newcastle. The site is within the Port Stephens local government area (LGA), on Tomago Road, Tomago NSW. The local area is predominantly industrial, with the nearest residence approximately 1.3km west of the Tomago Aluminium boundary. The regional context of the Tomago Aluminium site (blue point) and the Regain facility (green point) is shown in **Figure 1**. The Regain facility layout within the Tomago Aluminium site, include the stack locations are presented in **Figure 2**.

## 2.2 Spent Potliner (SPL)

Tomago Aluminium has a number of potlines, each containing enough pots to meet current industry demands, used for the smelting of Aluminium. Potlining has a life cycle of six to seven years, over which time it becomes contaminated with materials such as alumina, aluminium, calcium, fluoride compounds and sodium. Cyanide compounds and aluminium carbide can also be created in the reducing atmosphere of the pots and infiltrate the potlining. The deteriorated potlining, known as spent potlining (SPL), is regularly replaced as part of the periodic individual rebuilding of the pots. Potlining is typically removed in two stages. First-cut SPL is the removed carbon cathode lining, whilst second-cut SPL is the removed refractory lining. SPL is removed from the pots at the smelter's Deline facility.

The composition of the SPL material is variable. Up to 10% of the SPL is typically aluminium and sodium nitrides and carbides, which are created through the diffusion of air into the carbon lining and chemical reactions occurring in the pot. When water is introduced, these materials can react to form ammonia, hydrogen, methane and acetylene. Fluoride compounds, which are potentially hazardous materials, can also be present in the SPL at concentrations of up to 10%. The majority of the SPL consists of non-activated carbon (10 – 70%), aluminium oxide (10 – 30%), and aluminium (10 – 30%).

The fluxing properties and calorific value of the SPL are inherently useful to the cement manufacturing sector. The reprocessing of the SPL, therefore, creates valuable products as well as reducing the waste disposal issues for the aluminium smelter.

This page has been left blank intentionally.

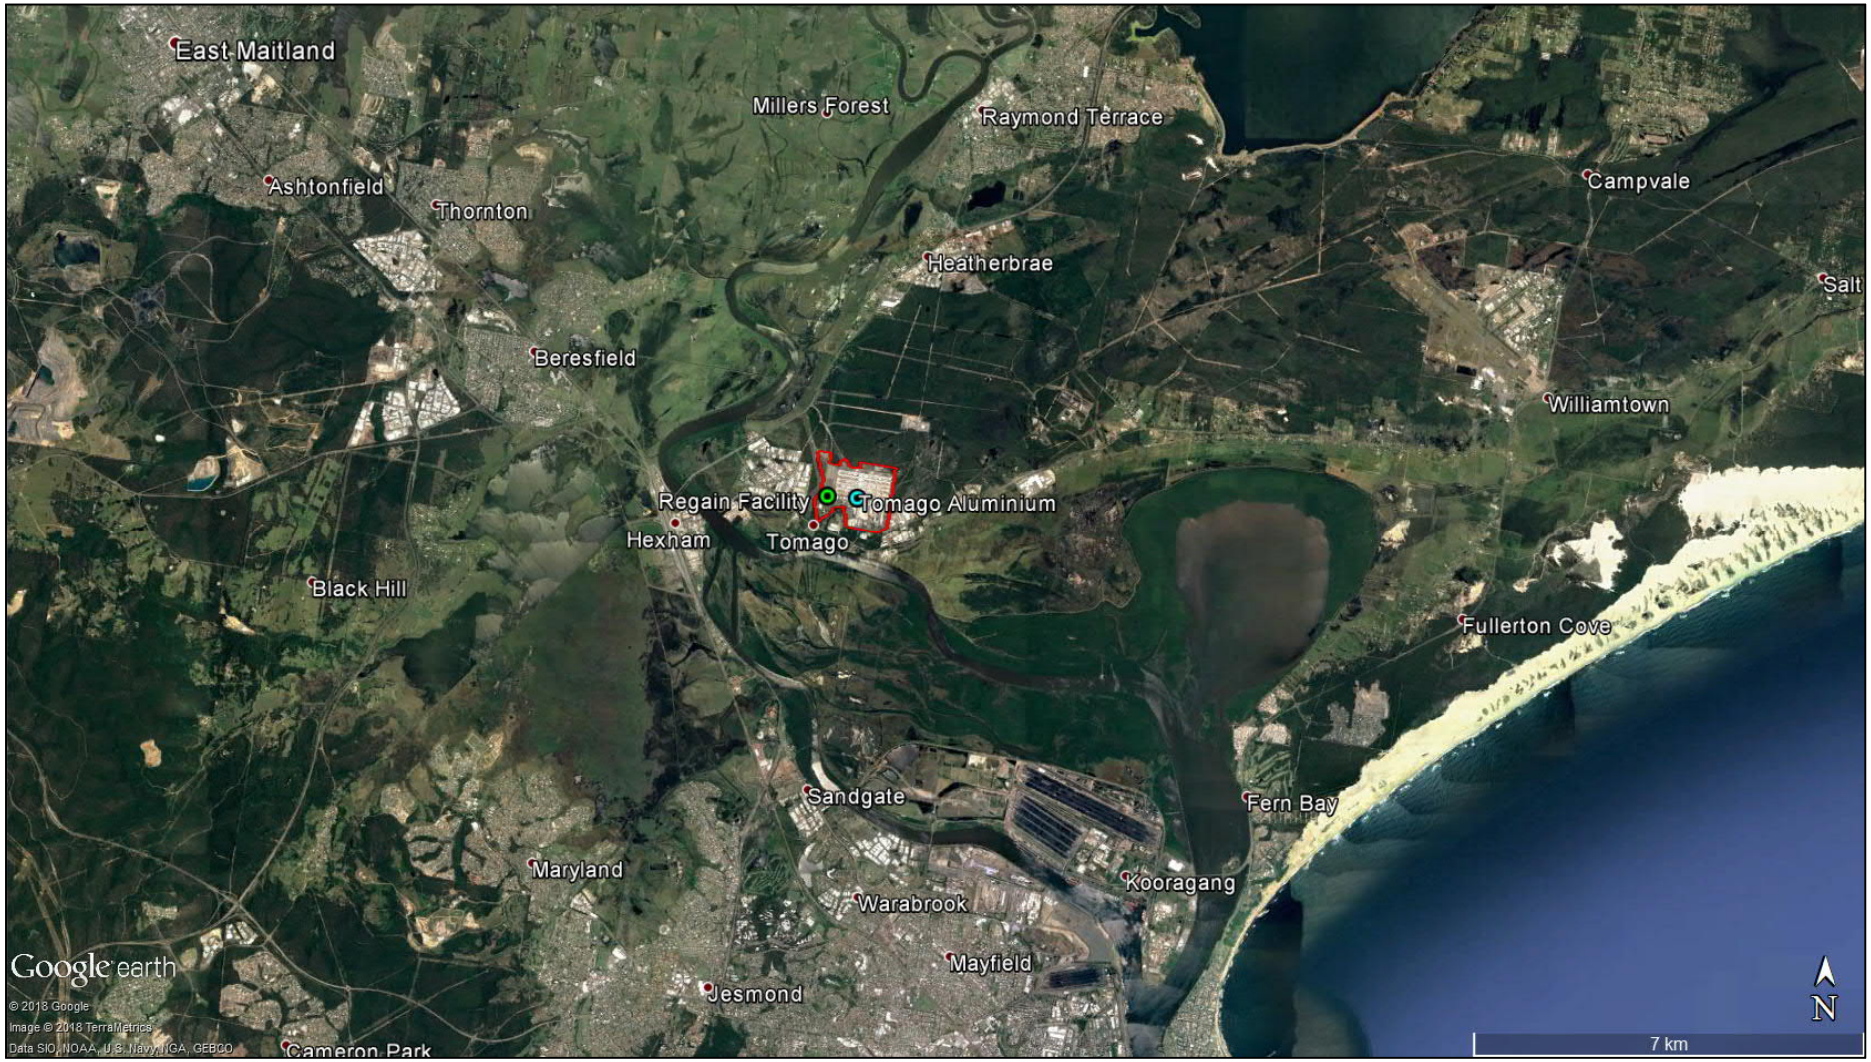

**Figure 1 Regional Site Context**

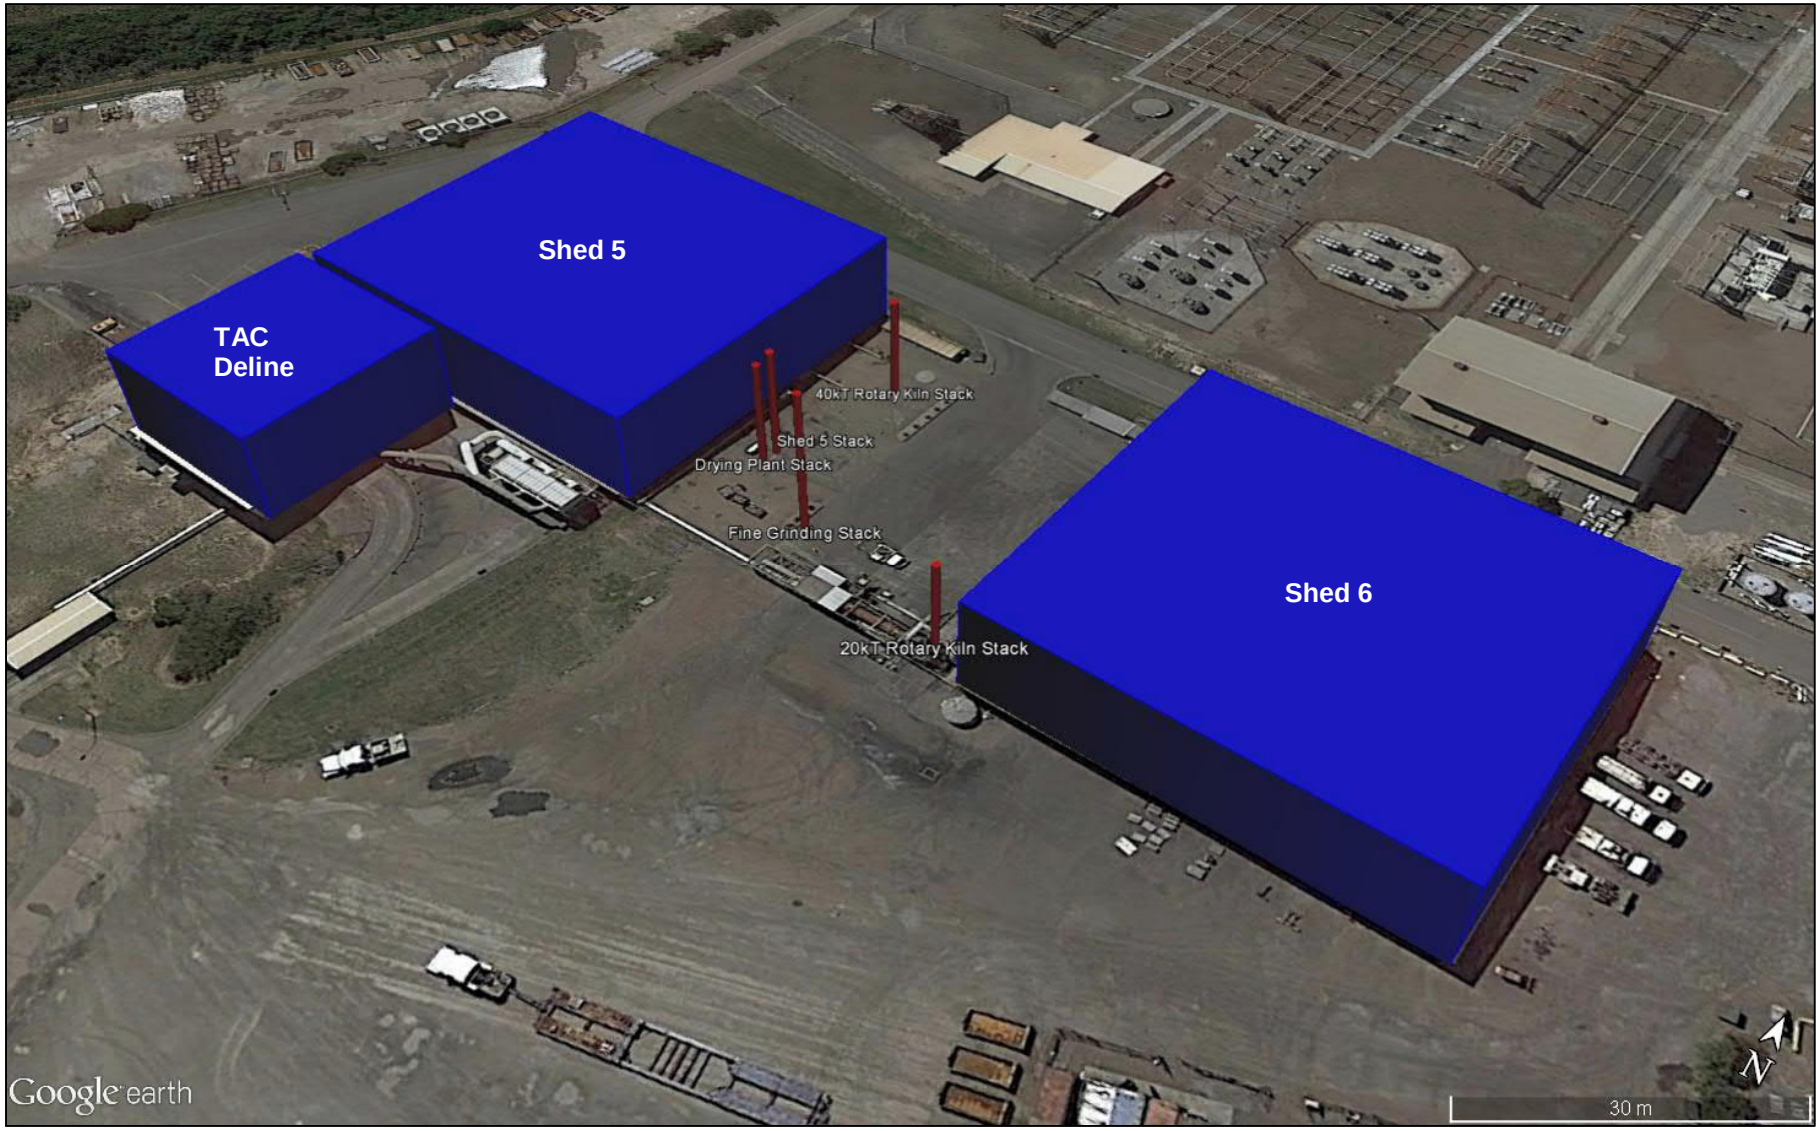

**Figure 2 Regain Facility Layout (Including nearby Tomago Aluminium Deline Shed D**

## 2.3 Approved Operations & Process Description

The current SPL processing plant and amenities are located in two adjacent existing buildings on the Tomago Aluminium site, known as SPL Sheds 5 and 6. SPL Shed 5 is adjacent to the Tomago Aluminium Deline facility, where the SPL is removed from the pots. Each building is 55 m long x 50 m wide (floor area of 2,750 $m^2$) with a height of 12m. The building sides (north and south) are fitted with louvre type ventilation panels. The steel retaining walls are sealed to the floor excluding the two doorways per building.

The current approval associated with the 2009 EA includes the plant items as follows:

- Materials preparation – including SPL crushing, sizing, grinding and storage facilities.
- SPL Thermal treatment – including a rotary kiln and water reaction mixer.
- Product plant – including blending, drying and final product crushing and storage facilities.

The existing plant constructed to date is in general accordance with the project description provided in the 2009 EA which stated that:

- The heat treatment plant (which would include a rotary kiln and water reaction mixer) and product plant (where grinding and blending, drying, final product crushing and storage would be undertaken) would be located between Shed 5 and Shed 6; and
- Plant associated with the existing 20,000 tpa plant, including conveyors, crushing, grinding and sizing equipment, raw material and product bins, etc., may be retained and utilised in the proposed project.

### 2.3.1 Discharge Points

The current Approval for the Regain facility has all externally-located plant enclosed, and all emissions from the project occur via three independent dust extraction and collection points:

- Thermal treatment plant dust collector stack.
- Drying and blending plant dust collector stack.
- SPL Shed 5 and Deline facility air filter (SPL preparation facilities) stack.

The SPL processing and product storage facilities are fully sealed, including covered conveyors and sealed atmospheric storage bins. Ductwork is installed throughout the process plant system and connected to dust generating areas such as mills, crushers, conveyors, storage bins and the kiln/dryer. The dust extraction systems will maintain a negative pressure within the process system and buildings, preventing the escape of fugitive dust.

Dust will be collected via the baghouse dust collectors, which will be fitted with alarm systems to immediately shut down plant operations in the event of baghouse failure. Visual and audible alarms will sound within the plant buildings, with the alarm displaying on the plant control system monitoring display. Collected particulate matter will be fed back through the production cycle.

The dust extraction systems will draw air from within each building at the roof ridgeline, and pass it through dust filter/baghouse facilities. The air discharge from each baghouse will be directed to atmosphere via stacks. The solid discharge from each baghouse will be collected and fed to the products blending hopper.

### 2.3.2 Control Measures

Regain has developed an extensive control system for their facilities to manage air emissions from their plant. Control measures are focused around the operation of suitable baghouse dust collectors and process operational controls e.g. control of process materials, housekeeping etc.

The approved SPL processing facility is operated and maintained to ensure the following:

- Mitigation of fugitive emissions by maintaining the processing plant and buildings under negative pressure.
- Destruction of cyanide and hazardous gases by control of the processing stages.

- Minimal formation of incomplete combustion products and liberation of gaseous fluoride by control of the thermal treatment process (i.e. maintaining the temperature below 850$^{o}$C).
- Minimal emissions of particulate matter and particulate-bound contaminants such as fluoride by the appropriate operation of baghouse dust collectors.
- Minimal dust generation from concrete apron areas by the application of appropriate housekeeping practices.

## 2.4 Proposed Site Modifications & Operations

The project is to modify the existing SPL processing facility on site at the Tomago Aluminium smelter which reduces the hazardous nature of a waste material through thermal treatment thereby recycling a waste material into a useable end-product.

The project (as modified) would generally comprise:

- Materials preparation: This would involve SPL crushing and sizing, and would be located in Shed 5. Quantities of SPL would continue to be stockpiled in Shed 5. No modification to existing material preparation processes is proposed as a result of this modification;
- Thermal treatment: This would involve a heat treatment process which would destroy the cyanide and neutralise the flammable gas hazard associated with SPL while retaining valuable materials such as carbon, fluorides, and other inorganic compounds. Thermal treatment would occur between Shed 5 and Shed 6;
- Product preparation: The product plant would involve drying and grinding treated SPL to suit product specification. Product plant elements would be located between the two existing buildings;
- Storage of materials: Quantities of SPL would continue to be stored in Shed 5. Treated product would be stored in Shed 6; and
- Daily truck movement to and from site for unloading SPL material for treatment and loading for delivery and distribution of treated products via road trucks.

To reach the target capacity of 60,000tpa and other product specifications, it is proposed to operate an optimised configuration utilising the thermal treatment process elements of both the originally proposed project and an additional thermal treatment plant and fine grinding mill. An overview of the revised project configuration which pertains to this air quality impact assessment is provided in **Table 3**.

**Table 3 Overview of Revised Project Configuration**

| Project Configuration (2009 EA) | Revised Project Configuration |
|---|---|
| Stack 1 - Thermal treatment plant dust collector (EPL Point 1) | Stack 1 – Thermal treatment plant dust collector (EPL Point 1) |
| | Stack 2 - Additional thermal treatment plant dust collector (New EPL Point) |
| Stack 2 Drying and blending plant dust collector (EPL Point 2) | Stack 3 – Drying plant (EPL Point 2) |
| | Stack 4 – Fine Grinding Stack (New EPL Point) |
| Stack 3 - Shed 5 and Deline facility air filter (EPL Point 3) | Stack 5 - Shed 5 and Deline facility air filter (EPL Point 3) |

# 3.0 Regulatory Context and Criteria

In assessing any project with potential emissions to air, it is necessary to compare the impacts of the project with relevant air quality goals. Air quality standards or goals are used to assess the potential for ambient air quality to give rise to adverse health or nuisance effects. The following sections detail relevant legislation and guidelines.

## 3.1 Air Quality Legislative Framework

In *NSW the Protection of the Environment Operations Act 1997 (NSW) (POEO Act)* provides the statutory framework for managing air emissions. Under the *POEO* Act the *Protection of the Environment Operations (Clean Air) Regulation 2010 (NSW)* (Clean Air Regulation) provides regulatory measures to control air emissions.

Part 5 of the Clean Air Regulation refers to the *Approved Methods for the Modelling and Assessment of Air Pollutants in NSW* (EPA 2017) (Approved Methods), that lists the statutory methods for the modelling and assessment of air emissions from stationary sources in NSW.

## 3.2 NSW EPA Approved Methods

The *Approved Methods* provide the assessment criteria against which emissions from a site or activity are to be assessed. The primary air pollutants of concern for assessment of the Project are presented in **Table 4**.

For the purposes of this AQIA and in accordance with *Section 2.1* of the *Approved Methods* a Level 2 Impact Assessment was undertaken using site specific input data. *Section 7.1.*2 and Section *7.2.2* of the *Approved Methods* requires the impact assessment criteria to be applied as follows:

*Section 7.1.2 – $SO_2$, $NO_2$, $O_3$, Pb, $PM_{2.5}$, $PM_{10}$, TSP, deposited dust, CO and HF*

1. At the nearest existing or likely future off-site sensitive receptor
2. The incremental impact for each pollutant must be reported in concentration units consistent with the criteria
3. Background concentrations must be included using the procedures specified in *Section 5,* which assessment includes:
    - Obtaining ambient monitoring data that includes at least one year of continuous measurements;
    - Determine the maximum background concentration of the pollutant being assessed for each relevant averaging period; and
    - At the maximum exposed off-site receptor, add the maximum background concentration and the 100$^{th}$ percentile dispersion model prediction
4. Total impact must be reported as the 100$^{th}$ percentile in concentration or deposition units consistent with the impact assessment criteria and compared with the relevant impact assessment criteria.

*Section 7.2.2 – Individual Toxic Air Pollutants*

1. At or beyond the boundary of the facility; and
2. The incremental impact for each pollutant must be reported in concentration units consistent with the criteria, for an averaging period of 1 hour and as the:
    a. 99.9$^{th}$ percentile of dispersion model predictions for Level 2 impact assessments.

These criteria are intended to minimise the adverse effects of airborne pollutants on sensitive receivers. In general, these criteria relate to the total burden of air pollutants at ground level and not just from project specific sources. Where background data was available, the ground level concentrations from the project have been assessed cumulatively with the background data against the NSW EPA criteria.

**Table 4 NSW EPA Assessment Criteria**

| Pollutant | Assessment Criterion ($\mu g/m^3$) | Averaging Period | Percentile | Reportable Location |
|---|---|---|---|---|
| Sulfur Dioxide ($SO_2$) | 570 | 1 hour | 100th | At the nearest sensitive receptor |
| | 228 | 24 hours | 100th | At the nearest sensitive receptor |
| | 60 | Annual | 100th | At the nearest sensitive receptor |
| Nitrogen Dioxide ($NO_2$) | 246 | 1 hour | 100th | At the nearest sensitive receptor |
| | 62 | Annual | 100th | At the nearest sensitive receptor |
| Carbon Monoxide (CO) | 30,000 | 1 hour | 100th | At the nearest sensitive receptor |
| | 10,000 | 8 hour | 100th | At the nearest sensitive receptor |
| $PM_{10}$ | 50 | 24 hour | 100th | At the nearest sensitive receptor |
| | 25 | Annual | 100th | At the nearest sensitive receptor |
| Lead | 0.5 | Annual | 100th | At the nearest sensitive receptor |
| Total Suspended Particulates | 90 | Annual | 100th | At the nearest sensitive receptor |
| Hydrogen Fluoride (general land use)[1] | 2.9 | 24 hours | 100th | At the nearest sensitive receptor |
| | 1.7 | 7 days | 100th | At the nearest sensitive receptor |
| | 0.84 | 30 days | 100th | At the nearest sensitive receptor |
| | 0.5 | 90 days | 100th | At the nearest sensitive receptor |
| Cyanide | 200 | 1 hour | 99.9th | At and beyond the boundary |
| Dioxins & Furans | $2x10^{-6}$ | 1 hour | 99.9th | At and beyond the boundary |
| PAH's as benzo(a)pyrene | 0.4 | 1 hour | 99.9th | At and beyond the boundary |
| Antimony | 9 | 1 hour | 99.9th | At and beyond the boundary |
| Arsenic | 0.09 | 1 hour | 99.9th | At and beyond the boundary |
| Cadmium | 0.018 | 1 hour | 99.9th | At and beyond the boundary |
| Chromium | 0.09 | 1 hour | 99.9th | At and beyond the boundary |
| Manganese | 18 | 1 hour | 99.9th | At and beyond the boundary |
| Mercury | 1.8 | 1 hour | 99.9th | At and beyond the boundary |
| Nickel | 0.18 | 1 hour | 99.9th | At and beyond the boundary |
| Acetone | 22,000 | 1 hour | 99.9th | At and beyond the boundary |
| Benzene | 29 | 1 hour | 99.9th | At and beyond the boundary |
| Toluene | 360 | 1 hour | 99.9th | At and beyond the boundary |

[1] ANZECC (1990) goals for ambient air fluoride are designed to protect against injury to plants and grazing animals rather than to protect human health.

### 3.2.1 ANZECC (1990) Ambient Fluoride Assessment Criteria

The applicability of the ambient fluoride ground level concentration criteria for this assessment needs to be considered in regards to the land use surrounding the project being assessed. The Australian and New Zealand Environment Council (ANZECC) *National Goals for Fluoride in Ambient Air and Forage (1990)* states that '*unlike most ambient objectives, guidelines or standards for common air pollutants, goals for ambient air fluoride are designed to protect against injury to plants and grazing animals, rather than to protect human health. This is because fluoride can injure vegetation at one thousandth the level of concern to human health*'.

Additionally, ANZECC further advise that '*the ambient air goals for fluoride are intended for areas of commercial or conservation value and not intended for comparison with airborne or foliar fluoride levels within industrial areas or buffer zones associated with fluoride emitting industries'*

In the context of this assessment, **Figure 3** highlights the local area surrounding the aluminium smelter, including the approved buffer zone highlighted in green, the Tomago Aluminium site boundary marked in red, and the locations of the sensitive receptors included in this assessment.

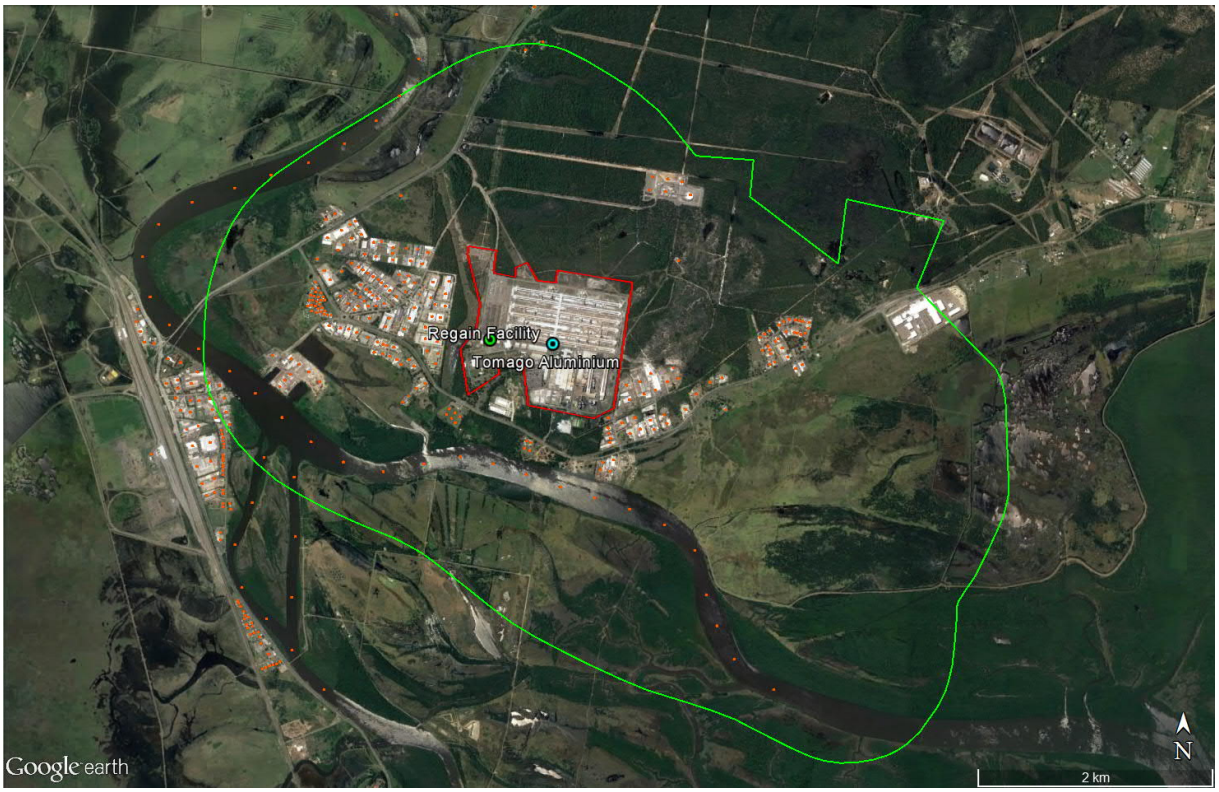

**Figure 3 Tomago Aluminium Buffer Zone (Green), Site Boundary (Red) & Modelled Sensitive Receptor Locations (Orange)**

The sensitive receptors identified within approximately 2km of the aluminium smelter are all within the approved buffer zone, where high background ambient fluoride levels are expected as a result of existing approved operation of the smelter. The high density of sensitive receptor locations immediately to the west, and east of the aluminium smelter are all zoned for industrial/commercial use, and do not have vegetation or grazing animals at those locations.

In accordance with the ANZECC (1990) guidance, the intent of the fluoride ambient air criteria suggests it may not be suitable to be applied at the industrial sensitive receptor locations, or those which fall within the approved buffer zone.

For the purpose of this assessment however, comparison with the ambient fluoride criteria was completed to provide an indication of the potential Regain contribution to cumulative ambient fluoride concentrations at those locations.

This page has been left blank intentionally.

# 4.0 Existing Environmental & Meteorological Conditions

The major factors of the existing environment that can influence the level of air pollutants adjacent to a particular site include:

- Existing air quality due to regional and local sources of air pollution (natural and anthropogenic);
- Meteorological conditions; and
- Surrounding terrain/land use.

The following section describes the existing air quality, general meteorology and terrain of the study area.

## 4.1 Existing Air Quality

The EPA monitors air quality each year and assesses it against the impact assessment criteria outlined in the *Approved Methods*. The air quality objectives which are linked to the impact assessment criteria are set at levels that are designed to protect beneficial uses, including human health and wellbeing, visibility, aesthetic enjoyment and local amenity. The goals in the *Approved Methods* specify the maximum permissible number of exceedances of the objectives per year and guide the formulation of strategies for the management of human activities that may affect the environment.

The ambient data collected by the EPA captures pollutants from both man-made (industry, motor vehicles, domestic sources such as fires, construction) and natural (bushfires, dust storms, pollen, marine particles) sources. A variety of pollutants are present in air monitoring data from each source; the contribution of each source varies depending on the monitor's location, sources of pollution in the surrounding environment and meteorological conditions.

The primary pollutants of interest in the Newcastle airshed are particulate matter and photochemical smog/ozone and its precursors (oxides of nitrogen)[1]. Significant industrial pollutant sources are located in the surrounding area, including the Tomago Aluminium site and a number of other smaller industrial sites.

### 4.1.1 Air Toxics

Although no recent measured background concentrations are available for air toxics in the Newcastle airshed, between 1996 and 2001 the EPA conducted an Ambient Air Quality Research Project (EPA 2002 and DEC 2004) to study the presence of air toxics in Sydney, Newcastle and Wollongong, including the monitoring of 41 organic compounds. In summary the results of the study concluded that ground level air quality concentrations of most air toxics in NSW were well below current international standards and benchmarks. As such, existing background concentrations were assumed to be negligible, and not included in this study.

### 4.1.2 Particulate Matter & Combustion Gases

The EPA currently operates a continuous monitoring station at Beresfield, approximately 5km from the Regain Tomago site, to help characterise the air quality in the region. The pollutants which are monitored at the Beresfield site and relevant to this assessment are oxides of nitrogen (NOx), ozone, fine particulate matter ($PM_{10}$) and sulphur dioxide ($SO_2$). The 2015 monitoring data from the Beresfield NSW EPA monitoring station (the closest station to the site) is summarised in **Table 5**.

Carbon Monoxide (CO) background data is not measured at the Beresfield monitoring station, however a background result was sourced from the NSW Annual Compliance Report (2015)[2] for the max 8-hour rolling average, which has also been included in **Table 5**.

The data from the OEH Beresfield monitoring station for the 2015 calendar year shows that the background levels of the measured pollutants are compliance with the NSW EPA ambient air quality criteria, with exception to the maximum 24-hr average $PM_{10}$ concentration.

[1] Newcastle City Council. (2009). 2008/09 State of the Environment Report – The City of Newcastle.

[2] Office of Environment & Heritage (2015), *NSW Annual Compliance Report – NEPM Ambient Air Quality, May 2017*

**Table 5 NSW EPA Beresfield Monitoring Station Data Summary 2015**

| Parameter | $NO_2$ 1hr Average | | $SO_2$ 1hr Average | | CO 1hr Average | | $PM_{10}$ 24hr Average |
|---|---|---|---|---|---|---|---|
| | pphm | $\mu g/m^3$* | pphm | $\mu g/m^3$* | ppm | $mg/m^3$ * | $\mu g/m^3$ |
| Maximum | 4.9 | 92.1 | 8.2 | 214.8 | N/A | N/A | - |
| Average | 0.9 | 16.9 | 0.1 | 2.7 | N/A | N/A | - |

* converted at 0'C as per NSW EPA criteria correction
[1] There are two exceedances of the ambient background concentration for Max 24hr $PM_{10}$ results
N/A = Result not available from Beresfield Monitoring Station
[#] Result taken from the latest (2015) NSW Air NEPM Compliance Report, and is a max 8-hour rolling average from the Newcastle EPA Monitoring site

At the NSW EPA Beresfield monitoring station in 2015, there were two days where the ambient air background concentration exceeded the maximum 24-hr average $PM_{10}$ criteria of 50µg/$m^3$. According to the NSW Annual Compliance Report (2015) the two days which resulted in exceedances of the criteria were the result of 'exceptional events', and presented in **Table 6**, along with the highest 24-hr $PM_{10}$ result, which was compliant.

**Table 6 Summary of Background 24-hr Average PM10 Results – NSW EPA Beresfield Station**

| Date | Concentration ($\mu g/m^3$) | Notes |
|---|---|---|
| 06/05/2015 | 64.9 | Result of a state-wide dust storm that travelled throughout NSW during 5 & 6 May 2015 |
| 26/11/2015 | 57.4 | Due to bushfires in the Hunter Valley region on 26 November 2015 |
| 19/11/2015 | 43.3 | Highest concentration reported at Beresfield monitoring station that is compliant with criteria |

### 4.1.3 Fluoride – Tomago Aluminium

The continuous monitoring station operated by the NSW EPA at their Beresfield location does not monitor for ambient fluoride. As the Regain Tomago facility is located within the Tomago Aluminium site, Regain provided AECOM with the 2015 ambient fluoride data for the monitoring sites operated by Tomago Aluminium. The location of each of the ambient fluoride monitors operated by Tomago Aluminium in relation to the site and the Regain facility is provided in **Figure 4**.

The closest ambient fluoride monitoring site relative to the Regain facility is EPL Point 21. This monitoring site is located on Old Punt Road, Tomago approximately 850m west of the Regain facility. Given the close proximity of this monitoring site in relation to the Regain facility, and its location amongst the nearest sensitive receptors in the industrial park, the ambient background concentrations for fluoride from this monitoring site were adopted for the assessment.

Two of the other Tomago monitoring locations (EPL Points 22 & 24) recorded elevated 7-day average background fluoride concentrations, with a maximum of 1.78µg/m$^3$ and 5.80µg/m$^3$, which are both above the NSW EPA ambient criteria for fluoride. These two monitoring sites are located within the Tomago Aluminium buffer zone, but over 2km from the Regain facility, so are not considered representative of the background concentrations at the nearest sensitive receptors located within 400m of the EPL Point 21 ambient fluoride monitoring station.

The monitoring results provided by Regain were reported as a 7-day average, with the 30-day and 90-day averages calculated from those concentrations. A summary of the ambient fluoride monitoring results and associated calculated values for EPL Point 21 are provided in **Table 7**. The 7-day ambient fluoride concentrations for the entire 2015 calendar year are presented in **Appendix C**.

**Table 7 Tomago Aluminium EPL Point 21 – Ambient Fluoride Results Summary**

| Parameter | Units | Averaging Period | | |
|---|---|---|---|---|
| | | 7-day | 30-day | 90-day |
| Maximum Ground Level Concentration (GLC) | µg/m$^3$ | 1.18 | 0.81 | **0.60** |
| No. of Exceedances | Integer | 0 | 0 | 2 |
| Maximum Non-Exceedance GLC | µg/m$^3$ | 1.18 | 0.81 | 0.20 |
| **Criteria** | **µg/m$^3$** | **1.7** | **0.84** | **0.5** |

It should be noted that the background ambient fluoride concentrations are elevated, with the calculated 90-day average for fluoride showing 2 exceedances of the NSW EPA criteria. The elevated background concentrations for fluoride are expected as a result of the Tomago Aluminium smelter operations, and they also fall within the approved buffer zone surrounding the Tomago Aluminium site.

For the purposes of this cumulative assessment, the calculated 90-day maximum ground level concentration for fluoride which does not exceed the criteria was adopted for this averaging period, to assess whether the Project impacts may result in additional exceedances of the ground level concentration criteria.

### 4.1.4 Sulfur Dioxide – Tomago Aluminium

As well as monitoring for ambient Hydrogen Fluoride, Tomago Aluminium also operates a number of Sulfur Dioxide ambient monitoring locations, which have also been considered in this assessment. As the Regain Tomago facility is located within the Tomago Aluminium site, the 2015 ambient sulfur dioxide data recorded at monitoring sites operated by Tomago Aluminium were reviewed to establish existing background concentrations. The location of each of the TAC ambient sulfur dioxide monitors in relation to the site and the Regain facility is provided in **Figure 4**.

The closest ambient sulfur dioxide monitoring site relative to the Regain facility is EPL Point 36. This monitoring site is located on Laverick Avenue, Tomago approximately 800m south west of the Regain facility. Given the close proximity of this monitoring site in relation to the Regain facility, and its location close to the nearest impacted sensitive receptors in the industrial park, the ambient background concentrations for sulfur dioxide from this monitoring site were adopted for the assessment.

Tomago Aluminium operate a number of the other $SO_2$ monitoring stations, located within the buffer zone but these are situated 1.5-2km from the Regain facility. Given the distance of these other monitoring locations from the Regain facility, they were not considered representative of the background concentrations at the nearest sensitive receptors to the project.

The 2015 monitoring results provided by Regain for the Tomago Aluminium EPL Point 36 $SO_2$ monitoring location are presented in **Table 8**.

**Table 8 Tomago Aluminium Ambient Sulfur Dioxide Results Summary – 2015 (EPL Point 36)**

| Parameter | Units | Averaging Period | | |
|---|---|---|---|---|
| | | 1-hour | 24-hour | Annual |
| Maximum GLC | µg/m$^3$ | 212.2 | 73.4 | 9.8 |
| **Criteria** | **µg/m$^3$** | **570** | **228** | **60** |

It should be noted that the background ambient sulfur dioxide concentrations for all of the monitoring locations are reasonably elevated. The elevated background concentrations for sulfur dioxide are expected as a result of the Tomago Aluminium smelter operations, and they also fall within the approved buffer zone surrounding the Tomago Aluminium site.

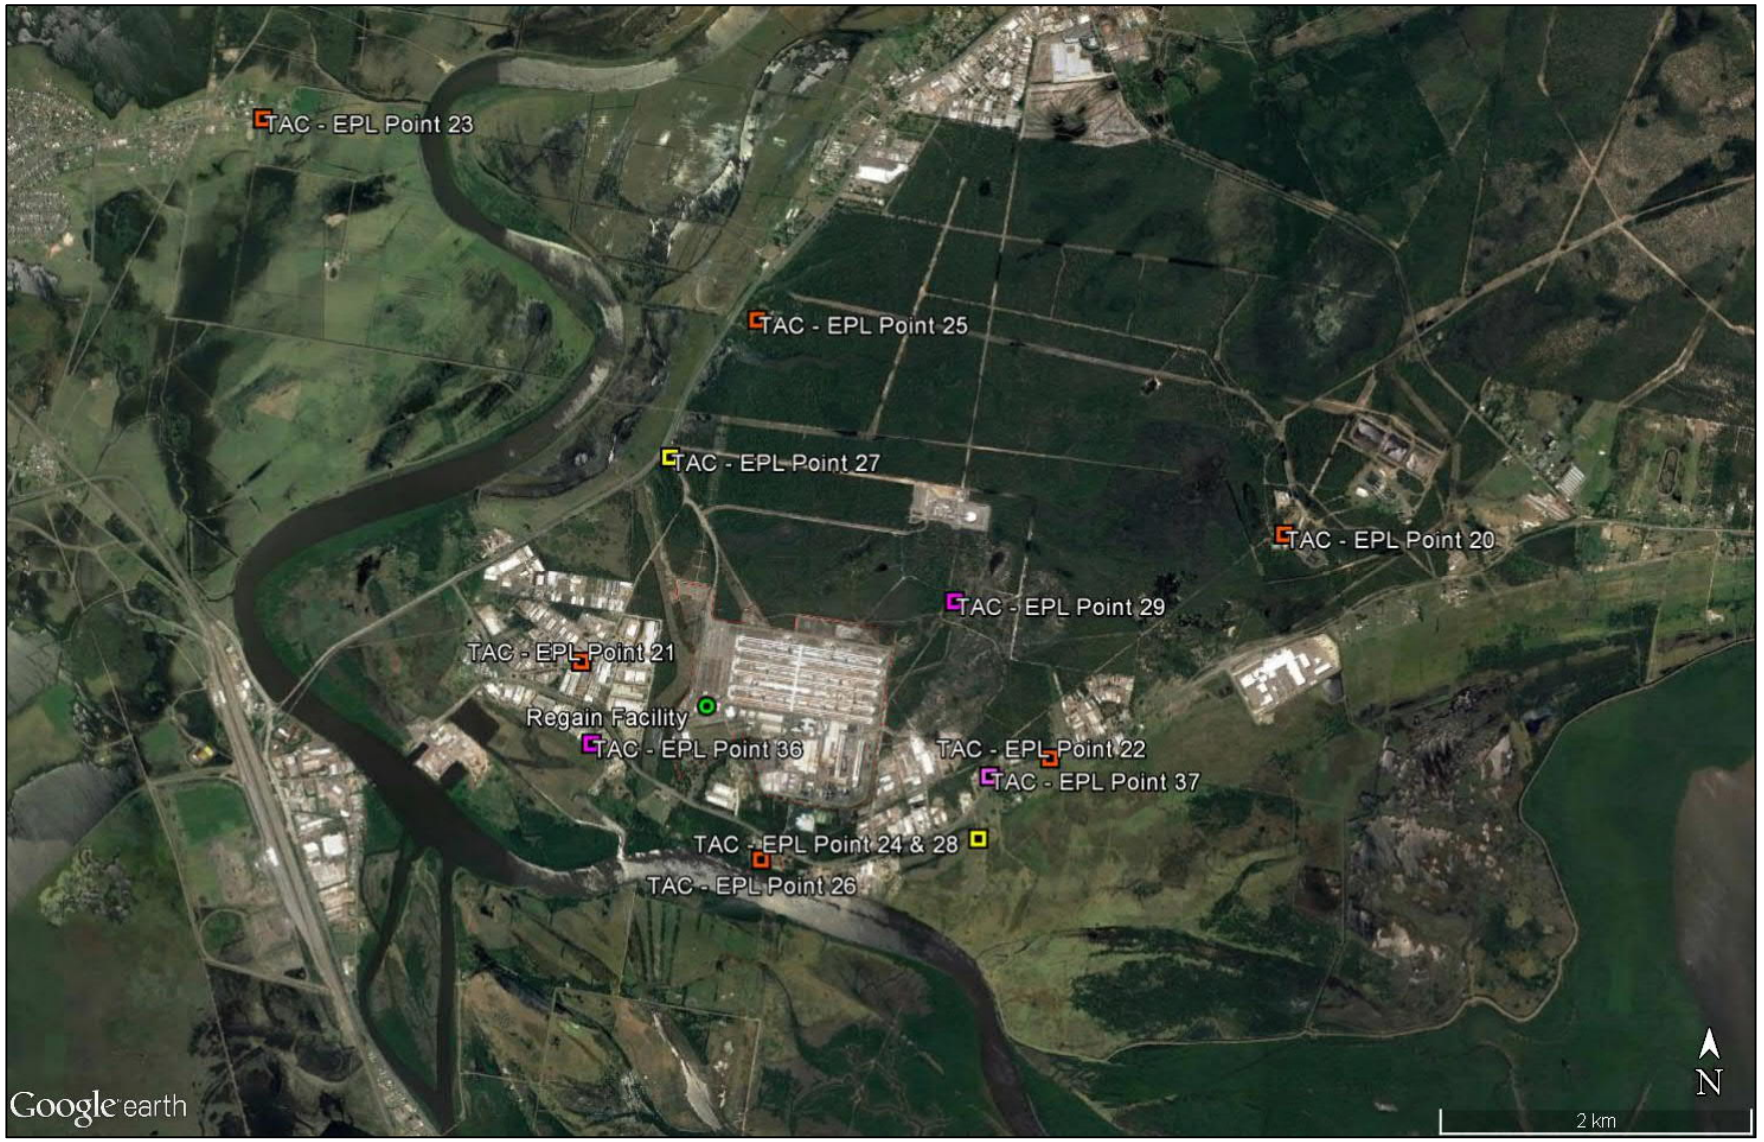

**Figure 4 Tomago Aluminium Ambient Fluoride & Sulfur Dioxide Monitoring Locations (Orange = Fluoride Only, Purple = $SO_2$ Only, Yellow = Fluoride + $SO_2$)**

### 4.1.5 Adopted Background Data

For the purposes of this assessment, at all sensitive receptor locations, the 100$^{th}$ percentile background pollutant concentrations (where available) for the 2015 calendar year were adopted. For most pollutants this resulted in background values below the assessment criteria.

Hydrogen Fluoride and $PM_{10}$ concentrations were elevated above their respective criteria for the maximum background concentration. The typical approach to addressing a situation where a pollutant's background concentration exceeds the ambient criteria is to adopt the highest background concentration which is compliant with the criteria, to assess if the incremental impacts from the project cause any additional exceedances.

The project specific background concentrations adopted for this assessment are presented in **Table 9**.

**Table 9 Project Specific Background Values**

| Pollutant | Averaging Period | Adopted Concentration (µg/m$^3$) | % of Criteria | Assessment Criteria (µg/m$^3$) |
|---|---|---|---|---|
| Sulfur Dioxide ($SO_2$) | 1 hour | 214.8 | 38 | 570 |
| | 24 hours | 73.4 | 32 | 228 |
| | Annual | 9.8 | 16 | 60 |
| Nitrogen Dioxide ($NO_2$) | 1 hour | 92.1 | 37 | 246 |
| | Annual | 16.9 | 27 | 62 |
| Carbon Monoxide (CO) | 1 hour | N/A | N/A | 30,000 |
| | 8 hour | 1.5 | 0.02 | 10,000 |
| $PM_{10}$ | 24 hour | 43.3 | 87 | 50 |
| | Annual | 18.7 | 75 | 25 |
| Lead | Annual | N/A | N/A | 0.5 |
| Total Suspended Particulates | Annual | N/A | N/A | 90 |
| Hydrogen Fluoride (general land use) | 90 days | 0.20 | 40 | 0.5 |
| | 30 days | 0.81 | 96 | 0.84 |
| | 7 days | 1.18 | 69 | 1.7 |
| | 24 hours | N/A | N/A | 2.9 |
| Cyanide | 1 hour | N/A | N/A | 200 |
| Dioxins & Furans | 1 hour | N/A | N/A | $2x10^{-6}$ |
| PAH's as benzo(a)pyrene | 1 hour | N/A | N/A | 0.4 |
| Antimony | 1 hour | N/A | N/A | 9 |
| Arsenic | 1 hour | N/A | N/A | 0.09 |
| Cadmium | 1 hour | N/A | N/A | 0.018 |
| Chromium | 1 hour | N/A | N/A | 0.09 |
| Manganese | 1 hour | N/A | N/A | 18 |
| Mercury | 1 hour | N/A | N/A | 1.8 |
| Nickel | 1 hour | N/A | N/A | 0.18 |
| Acetone | 1 hour | N/A | N/A | 22,000 |

| Pollutant | Averaging Period | Adopted Concentration (μg/m$^3$) | % of Criteria | Assessment Criteria (μg/m$^3$) |
|---|---|---|---|---|
| Benzene | 1 hour | N/A | N/A | 29 |
| Toluene | 1 hour | N/A | N/A | 360 |

## 4.2 Local Meteorological & Climatic Conditions

The Bureau of Meteorology (BoM) records long-term meteorological data at a number of automatic weather stations across the country. The BoM operate a meteorological weather station at Williamtown (Station number 061078) located approximately 12km east northeast of the site, and records temperature, rainfall, wind speed and wind direction. The station has been operational since 1942 with long term meteorological and climatic data for the Williamtown Airport BoM monitoring station provided in **Appendix A**.

The study area experiences a warm to moderate climate. The warmest temperatures occur during the summer months, with the highest average maximum temperature (28.1$^o$C) occurring in January. July is the coldest month, with a recorded average minimum temperature of 6.4$^o$C.

The annual average rainfall for the area is 1127 millimetres (mm) over 85 days a year. June is the wettest month, with an average rainfall of 121 mm, while August is driest month with an average rainfall of just 60.5mm. Humidity follows a diurnal cycle, with higher humidity in the morning compared to the afternoon.

Daytime wind speeds were found to be moderate, with higher wind speeds occurring in the afternoon compared to the morning. The annual average 9am wind speed recorded is 13.7 kilometres per hour (km/h) and the annual average 3pm wind speed was 20.2 km/h. Seasonally, wind speeds are higher during the warmer months with the highest average wind speed occurring in December at 23.5 km/h. The long-term wind roses show that on an annual basis the dominant wind direction is from the northwest quadrant during the mornings and from the southeast quadrant during the afternoons.

## 4.3 Terrain & Land Use

The Regain facility is situated with the Tomago Aluminium site, and lies approximately 9m above mean sea level (MSL). The terrain in the immediate area surrounding the facility is relatively flat. In the wider context the study area lies approximately 12km to the west of the Eastern Australian coastline and terrain height within the study area range from between 0 and 96 metres with higher elevations to the west and southwest. To the west and south of the site the Hunter River runs west to east, meeting Newcastle Harbour on the Stockton side 6.5km to the southeast of the site.

The surrounding land use is largely comprised of medium to large scale industrial premises. The area beyond the industrial premises is largely bound by native vegetation on all sides, with the Hunter River approximately 1km to the south. The closest urban residential receptors are approximately 1.4km from the Facility.

Land use categories used in the CALMET meteorological model we assigned using satellite imagery in accordance with the U.S. Geological Survey Land Use and Land Classification System.

# 5.0 Assessment Methodology

The following section provides a summary of the methodology adopted for the Regain Tomago assessment.

## 5.1 Air Dispersion Model

Various air dispersion models are required for the successful modelling of air quality impacts from the Site. These are: The Air Pollution Model (TAPM), which is used to generate prognostic meteorological data; CALTAPM, which is used to process the TAPM output into a format suitable for input into the CALMET model; CALMET, which generates three-dimensional wind fields used in the dispersion modelling; CALPUFF, which predicts the movement and concentration of pollutants; and CALPOST, which is used to process the CALPUFF output files. The programs are briefly described in the following sections.

The flow diagram in **Figure 5** shows the general flow of programs and data required for the dispersion model.

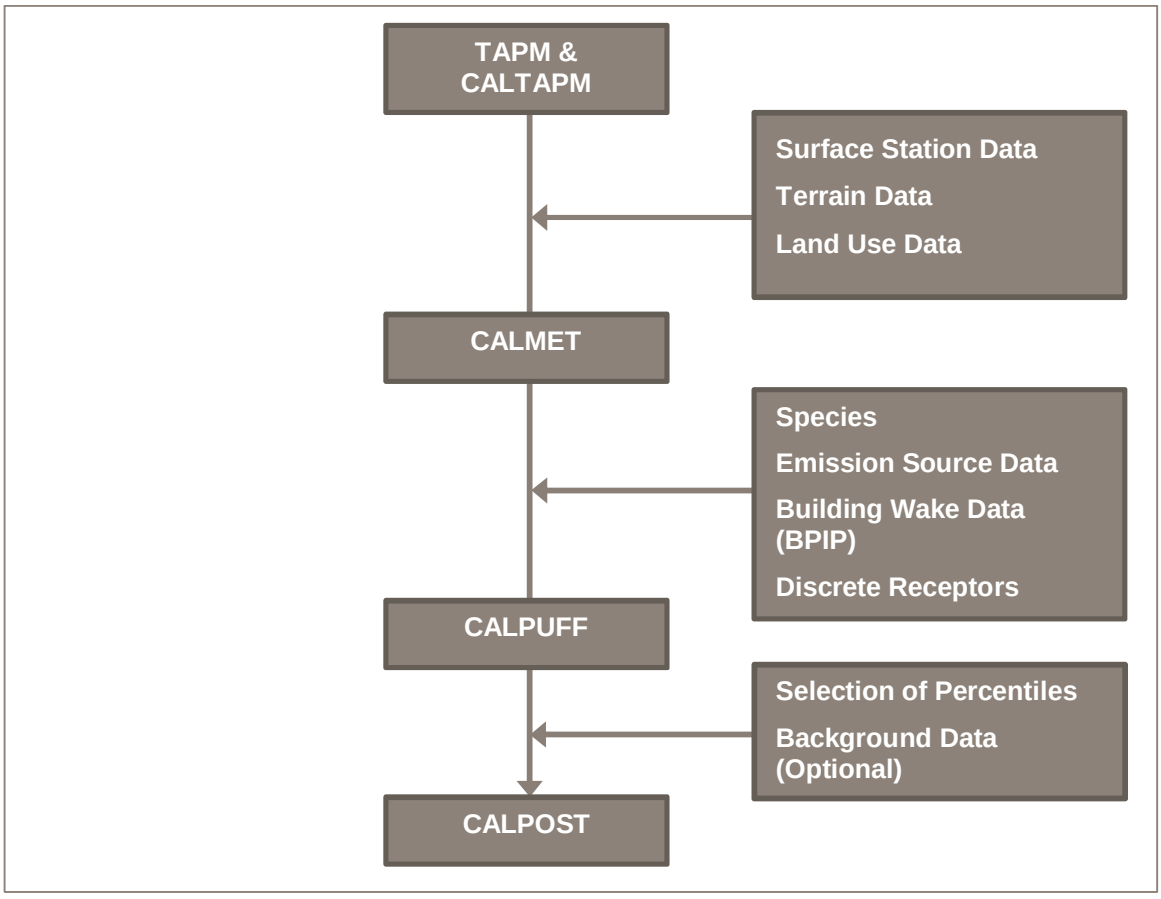

**Figure 5 Site Model Program and Input Flow Chart**

The selection of the dispersion modelling for this assessment was undertaken in accordance with the guidelines published by the NSW EPA[3]. Details of the modelling inputs and assumptions are provided in the following sections.

[3] DEC (2005). Approved Methods for the Modelling and Assessment of Air Pollutants in NSW.

## 5.2 TAPM

TAPM predicts three-dimensional meteorology, including terrain-induced circulations. TAPM is a PC-based interface that is connected to databases of terrain, vegetation and soil type, leaf area index, sea-surface temperature, and synoptic-scale meteorological analyses for various regions around the world. TAPM is used to predict meteorological parameters at both ground level and at heights of up to 8,000 m above the surface; these data are required by the CALPUFF model. The TAPM output file requires processing through a program such as CALTAPM to generate a file that is used within CALMET to generate the three-dimensional wind fields required by the CALPUFF dispersion model.

The NSW EPA has released guidance documentation (Barclay and Scire, 2011) on the optimum settings for the use of the CALPUFF modelling system. One modelling approach provided in the document is the use of a 'Hybrid Mode' whereby numerical prognostic three-dimensional meteorological model data, in a 3D.DAT file, along with surface observation data gained from a representative nearby surface monitoring station, are combined. The CALTAPM program converts the TAPM data into a 3D.DAT file, which can be input directly into the CALMET meteorological processer.

The settings used for the TAPM program are provided in **Table 10**.

**Table 10 TAPM Settings**

| Parameter | Setting |
|---|---|
| TAPM Version | 4.0.5 |
| Grid centre coordinates | -32 deg 53 min E |
| | 151 deg 48 min S |
| Date parameters | 20150101 to 20151231 |
| Number of grid points | nx = 40 |
| | ny = 40 |
| Outer grid spacing | dx1 = 30000 m |
| | dy1 = 30000 m |
| Number of grid domains | 4 |
| Grid spacing for CALTAPM | Inner most grid (t010a) |
| Number of vertical grid levels | nz = 25 |
| Observation file | Not used |

The modelling domain generated in the TAPM model provides prognostic data across 4 nested grids. The first outer grid covers an area of 1,440,000km$^2$ at 30km resolution. The nested grids step down progressively in dimensions, to the final innermost grid, which covers an area of 81km$^2$ at a resolution of 300m. In the vertical direction there are 25 levels (40 layers) from the surface to 100 hPa. The lowest layer is approximately 10m above the ground.

## 5.3 CALPUFF Modelling Package

CALPUFF is the NSW EPA model of choice for areas that are affected by coastal breezes, coastal fumigation or complex terrain. The Site is located in a coastal area and, hence, the CALPUFF model was chosen for use in the AQIA.

The CALPUFF modelling system consists of three main components and a set of pre-processing and post-processing programs. The main components of the modelling system are CALMET (a diagnostic three-dimensional meteorological model), CALPUFF (an air quality dispersion model), and CALPOST (a post-processing package). The three main CALPUFF software package programs are described in the following sections.

#### 5.3.1.1 CALMET

CALMET is a meteorological model that develops hourly wind and temperature fields on a three-dimensional gridded modelling domain. Associated two-dimensional fields such as mixing height, surface characteristics and dispersion properties are also included in the file produced by CALMET. CALMET produces a meteorological file that is used within the CALPUFF model to predict the movement of pollution.

The settings in **Table 11** were specifically selected in order to run CALMET in the 'obs' mode discussed in Barclay and Scire (2011). Only those parameters that deviate from the program default values or are significant to the AQIA are provided.

**Table 11 CALMET Settings**

| Parameter | Setting |
|---|---|
| CALMET version | 6.5.0 |
| Grid Spacing | 0.200 km |
| Grid Size | 30km x 30km |

#### 5.3.1.2 CALPUFF

CALPUFF is a non-steady-state three-dimensional Gaussian puff model developed for the US Environmental Protection Agency (US EPA) and approved by the NSW EPA for use in situations where basic Gaussian plume models are not effective, such as areas with complex meteorological or topographical conditions, including coastal areas with re-circulating sea breezes. The CALPUFF model substantially overcomes the basic limitations of the steady-state Gaussian plume models, and as such, was chosen as the most suitable dispersion model for the AQIA. Some examples of applications for which CALPUFF may be suitable include:

- Near-field impacts in complex flow or dispersion situations:
  - complex terrain;
  - stagnation, inversion, recirculation, and fumigation conditions;
  - overwater transport and coastal conditions;
  - light wind speed and calm wind conditions;
- Long range transport;
- Visibility assessments and Class I area impact studies;
- Criteria pollutant modelling, including application to development applications;
- Secondary pollutant formation and particulate matter modelling; and
- Buoyant area and line sources (e.g. forest fires and aluminium reduction facilities).

Those parameters that deviate from the program default values or are significant to the AQIA are provided in **Table 12**.

**Table 12 CALPUFF Settings**

| Parameter | Setting |
|---|---|
| CALPUFF version | 7.2.1 |
| Sampling Grid | 6km x 6km (200m spacing) |
| Calculation Type | Concentration |
| Chemical transformation method | Not modelled |
| Dispersion Option | Dispersion coefficient. use turbulence computed from micrometeorology |
| Use PDF method for Sigma-z in the convective BL | On |
| Puff splitting | No puff splitting |
| Plume rise method | Briggs |
| Transitional plume rise | On |
| Stack tip downwash | On |
| Partial plume penetration | On |
| Partial plume penetration (buoyant) | On |
| Terrain adjustment method | Partial plume path adjustment |
| Building wake calculation | PRIME algorithm |

#### 5.3.1.3 CALPOST

The CALPOST program is used to process the outputs of the CALPUFF program into a format defined by the user. Results can be tabulated for selected options including percentiles, selected days, gridded results or discrete locations, and can be adjusted to account for chemical transformation and background values.

The program default settings were used for the CALPOST program, ensuring that the correct averaging periods, percentiles and receptors were selected to meet the NSW EPA ambient pollutant criteria assessed (DEC, 2005). CALPOST version 7.1.0 was used in the assessment.

## 5.4 Modelling Scenario

In order to demonstrate that all potential emissions meet relevant ground level air quality standards, the operational scenario presented in **Table 13** was assessed.

**Table 13 Assessment Scenario**

| Scenario ID | Description |
|---|---|
| 1 | Proposed 60,000 tpa Operations (Maximum proposed EPL Emission Concentrations Scenario)<br>• Assumed 24 hour operations<br>• Emission rates calculated from the maximum EPL concentration limits listed in the Regain Tomago license for:<br>- 20,000 tpa Rotary Kiln Stack<br>- 40,000 tpa Rotary Kiln Stack<br>- Drying Plant Stack<br>- Shed 5 Stack<br>- Fine Grinding Mill Stack<br><br>*Note 1 – Where no available limit was listed in the current EPL for the expected pollutants from that source, a commensurate EPL limit was proposed in line with the current limits imposed on EPL Point 1.*<br><br>*Note 2 – For the speciated VOC's, where no EPL Limit was available for an individual VOC species, the relative percentage of each species was obtained from stack testing VOC data collected from the Regain site.*<br><br>*Note 3 - For all Type 1 & 2 Metals, where no EPL Limit was available for the individual species, the relative percentage of each elemental species was obtained from stack testing data collected from the Regain site.* |

Based on years of historical stack emissions testing data from the Regain facility, it is considered that adopting the maximum EPL concentration limits to determine the mass emission rates for the Project is a conservative approach. Historic operations and monitoring of the Regain facility has demonstrated that all stack pollutant concentrations levels are typically recorded below the listed EPL Limits.

## 5.5 Limitations

The atmosphere is a complex, physical system, and the movement of air in a given location is dependent on a number of different variables, including temperature, topography and land use, as well as larger-scale synoptic processes. Dispersion modelling is a method of simulating the movement of air pollutants in the atmosphere using mathematical equations. The model equations necessarily involve some level of simplification of these very complex processes based on our understanding of the processes involved and their interactions, available input data, and processing time and data storage limitations.

These simplifications come at the expense of accuracy, which particularly affects model predictions during certain meteorological conditions and source emission types. For example, the prediction of pollutant dispersion under low wind speed conditions (typically defined as those less than 1 m/s) or sub-hourly emissions. To accommodate these known deficiencies, the model outputs tend to provide conservative estimates of pollutant concentrations at particular locations.

The results of dispersion modelling provide an indication of the likely level of pollutants within the modelling domain. While the models, when used appropriately and with high quality input data, can provide very good indications of the scale of pollutant concentrations and the likely locations of the maximum concentrations occurring, their outputs should not be considered to be representative of exact pollutant concentrations at any given location or point in time.

# 6.0 CALPUFF Model Inputs

CALPUFF requires several main categories of data to determine the dispersion of pollutants:

- Meteorology;
- Terrain;
- Building wake effects;
- Sensitive receptor locations; and
- Emissions inventory.

The above inputs are addressed separately in the following sections.

## 6.1 Meteorology

The meteorological data are used by the model in different ways to estimate the dispersion of air pollutants:

- Ambient temperature is used to incorporate thermal buoyancy effects when calculating the rise and dispersion of pollutant plumes;
- Wind direction determines the direction in which pollutants will be carried;
- Wind speed influences the dilution and entrainment of the plume into the air continuum;
- Atmospheric stability class is a measure of atmospheric turbulence and the dispersive properties of the atmosphere. Most dispersion models utilise six stability classes, ranging from A (very unstable) to F (stable/very stable); and
- Vertical mixing height is the height at which vertical mixing occurs in the atmosphere.

The AQIA used meteorological data from a number of automatic weather stations in the Newcastle region, including the BoM Williamtown Airport, OEH Carrington, OEH Mayfield & OEH Stockton meteorological monitoring stations for the period January 2015 to December 2015.

A review of the CALMET data against the closest meteorological monitoring station (OEH Beresfield), and the long-term BoM Williamtown Airport data is provided in **Appendix B** in order to validate that the data used in the model are representative of the area and appropriate for use in the assessment. The review concluded that the CALMET data from this site are considered to be representative of meteorological conditions around the Site.

## 6.2 Terrain

Digital terrain data used to generate the upper air prognostic meteorological data were obtained from the TAPM 9 second DEM database covering an area of 30km by 30 km on a 1 km grid. For the CALMET model, the geophysical processor was used to convert land use and terrain data from WebGIS (SRTM1 for terrain at approximately a 30 metre resolution) and GLCC Australia Pacific (approximate 1 kilometre resolution) throughout the meteorological domain.

The terrain file is provided graphically in **Appendix B**, which also shows the locations of the surface meteorological stations.

## 6.3 Building Wake Effects

The dispersion of pollutants around the site is likely to be affected by aerodynamic wakes generated by winds having to flow around the buildings near the stack locations on the site. Building wakes generally decrease the distance downwind at which the stack plumes comes into contact with the ground. This may result in higher ground level pollutant concentrations closer to the emission source.

CALPUFF includes the PRIME building wake algorithm and the Building Profile Input Program (BPIP) for entering the location and dimension of buildings where building wakes may be important for dispersion. The nearby buildings were included in BPIP to estimate the building wakes required for the CALPUFF model. Building and point source locations are presented previously in **Figure 2**.

## 6.4 Sensitive Receptor Locations

The NSW EPA considers sensitive receptors to be areas where people are likely to either live, work, or engage in recreational activities. The area surrounding the facility is largely comprised of medium to large scale industrial premises. The area beyond the industrial premises is largely bound by native vegetation on all sides, with the Hunter River approximately 1km to the south. The closest urban residential receptors are approximately 1.4km from the facility. The Tomago Aluminium site, Regain facility and the surrounding area falling within a range of approximately 2-3km from the Tomago Aluminium site are located within the buffer zone identified in the Tomago Aluminium Development Consent.

All non-gridded sensitive receptor locations modelled are provided in **Figure 6**.

Given the proximity of some of the sensitive receptor locations to the site, gridded receptors were selected covering a 6km x 6km grid, with 200m spacing between receptors. Additionally, a denser grid of receptors was added in a 2km x 2km grid centred on the Regain facility with 50m spacing between them. The gridded receptors were selected to ensure a representative sample of all nearby potential sensitive receptor locations (not specifically identified in **Figure 6**) were included in this assessment. All gridded receptor locations modelled are presented in **Figure 7**

Finally, for the purposes of this assessment, some of the pollutants being assessed are categorised as being individual toxic air pollutants by the NSW EPA, and must show compliance with the ground-level assessment criteria "*at or beyond the boundary of the site*". Receptors at or beyond the Tomago Aluminium site boundary were included for this assessment.

**Figure 6 Modelled specific sensitive receptor locations**

**Figure 7 All gridded receptor locations**

## 6.5 Emissions Inventory

The emissions inventory for the assessment was prepared using site specific stack emissions testing data obtained from the current Regain Tomago facility, the previously operational Regain Hydro & Point Henry facilities and the Tomago Aluminium Delining shed. Stack emissions testing data also informed operational parameters such as expected temperatures, velocity & volumetric flow rates.

Flow rate data from the Regain Point Henry facility was used to determine the expected pollutant emission rates from the 40,000 tpa Rotary Kiln proposed for the site (which would be relocated from Point Henry). Regain have advised that this kiln is expected to operate at the Tomago site in the same manner as currently operational plant and as such the same EPL concentration limits are achievable and should be adopted.

Stack testing data from the Regain Hydro facility informed parameters for both the Drying Plant and Fine Grinding Mill to be installed at the Regain Tomago facility as it is current and most representative of expected emission parameters from those sources.

Data from the Tomago Aluminium Delining shed stack was provided by Regain for use in this assessment as it is the most representative of the current materials handling work which occurs within Shed 5 at the Regain facility. The Regain Shed 5 is currently vented to the same baghouse which serves the Tomago Aluminium Delining shed.

**Table 14** presents a summary of the emission points considered in this assessment, and the data source for each emission point.

**Table 14 Emission Points Data Summary**

| Proposed EPL Point No. | Stack Name | Data Source | Years Used | No. of Tests Used |
|---|---|---|---|---|
| 1 | 20,000 tpa Rotary Kiln | Regain Tomago Stack Testing Reports | 2014 – 2016 | 10 |
| 2 | 40,000 tpa Rotary Kiln | Regain Point Henry Stack Testing Reports | 2017 | 1 |
| 3 | Drying Plant Stack | Regain Hydro Stack Testing Reports | 2014 – 2015 | 8 |
| 4 | Shed 5 | Tomago Aluminium Deline Stack Testing Reports | 2014 – 2016 | 3 |
| 5 | Fine Grinding Mill | Regain Hydro Stack Testing Reports | 2014 – 2015 | 8 |

The use of site specific data is considered to be best practice and likely to reflect an accurate representation of the facilities potential operational parameters.

### 6.5.1 Current and Proposed EPL Point Concentration Limits

The relevant EPL concentration limits for the pollutants of interest in this assessment are provided in **Table 15** for each of the respective stacks where they were available. Where no current limit was available a concentration limit has been proposed.

Preliminary modelling suggested that the current Cadmium limit for EPL Point 1 of 0.035 mg/m$^3$ when adopted for both the current and proposed kiln may result in an exceedance of the ground level concentration limits. A new limit of 0.025 mg/m$^3$ is being proposed for both EPL Point 1 and 2, to ensure compliance with ground level concentration limits. The concentrations presented in **Table 15** were adopted for this assessment.

**Table 15 Current & Proposed EPL Concentration Limits**

| Pollutant | Units | 20,000 tpa Rotary Kiln Stack | 40,000 tpa Rotary Kiln Stack[1] | Drying Plant Stack[1] | Shed 5 Stack[1] | Fine Grinding Mill Stack[1] |
|---|---|---|---|---|---|---|
| Cadmium | $mg/m^3$ | 0.025[2] | 0.025[2] | N/A | N/A | N/A |
| Cyanide | $mg/m^3$ | 1 | 1 | N/A | N/A | N/A |
| Dioxins & Furans | $ng/m^3$ | 0.1 | 0.1 | N/A | N/A | N/A |
| Fine Particulates ($PM_{10}$) | $mg/m^3$ | 10 | 10 | 10 | 10 | 10 |
| Nitrogen Oxides (Equivalent $NO_2$) | $mg/m^3$ | 100 | 100 | N/A | N/A | N/A |
| Polycyclic Aromatic Hydrocarbons | $mg/m^3$ | 0.5 | 0.5 | N/A | N/A | N/A |
| Sulfur Dioxide | $mg/m^3$ | 50 | 50 | N/A | N/A | N/A |
| Total Fluoride | $mg/m^3$ | 5 | 5 | N/A | N/A | N/A |
| Total Solid Particulates | $mg/m^3$ | 20 | 20 | 20 | 20 | 20 |
| Type 1 & 2 Substances | $mg/m^3$ | 1 | 1 | N/A | N/A | N/A |
| Volatile Organic Compounds | $mg/m^3$ | 20 | 20 | N/A | N/A | N/A |

[1]EPL Limits have been adopted for this assessment from the currently approved limits for EPL Point 1 at the Regain Tomago facility

[2]Preliminary modelling suggested that the current Cadmium limit of 0.035 $mg/m^3$ adopted for both the current kiln and proposed kiln may result in an exceedance of the ground level concentration limits. A new limit of 0.025 $mg/m^3$ is being proposed for both EPL Point 1 and 2 to ensure compliance with the ground level concentration limit is achieved. The proposed Cadmium limit is achievable under normal operating conditions, based on years of historical stack emissions testing results.

Stack emissions testing was previously conducted by AECOM between 2014 - 2017 for the relevant emission points at the Regain Tomago, Hydro & Point Henry facilities, along with the Tomago Aluminium Deline baghouse stack. The stack emissions testing showed compliance with all the listed EPL limits for each of the respective licenses.

A summary of all the operational parameters (velocity, flow rate and temperature) for each stack from the testing, which was used to calculate the Regain Tomago emission rates associated with the Project is presented in **Appendix D**.

An emissions inventory was prepared based on these stack parameters and the EPL Concentration limits for the scenario being assessed as discussed in **Section 5.4**.

### 6.5.2 Stack Parameters & Emission Rates

**Table 16** & **Table 17** provide a summary of the emission points and emission rates considered in this assessment for the scenario listed in **Section 5.4**.

**Table 16 Summary of Modelled Emission Points**

| Source | Units | 20,000 tpa Rotary Kiln Stack | 40,000 tpa Rotary Kiln Stack[4] | Shed 5 Stack[4] | Fine Grinding Mill Stack | Drying Plant Stack |
|---|---|---|---|---|---|---|
| Easting | mE MGA94 | 379631 | 379605 | 379598 | 379609 | 379598 |
| Northing | mN MGA94 | 6367514 | 6367551 | 6367534 | 6367523 | 6367531 |

[1]Adopted from the Regain Point Henry Kiln operational parameters
[2]Adopted from the Regain Hydro operational parameters
[3]Adopted from the Tomago Aluminium Deline operational parameters

[4] The locations of these two stacks were modelled based on the proposed site concept layout. Since the completion of this assessment, the location of these two stacks has been swapped in the final design phase as a result of site layout and engineering optimisation. The stacks are separated by a distance of 18m. However both are similar in height and equally impacted by building wake effects of the adjacent shed. It is not expected that this swap of stack location would have a substantial effect on the reported pollutant ground level concentrations. The outcomes of this assessment would be addressed in a validation assessment undertaken upon completion of the proposed site modifications.

**Table 17 Summary of Modelled Emission Rates**

| Source | Units | 20,000 tpa Rotary Kiln Stack | 40,000 tpa Rotary Kiln Stack | Shed 5 Stack | Fine Grinding Mill Stack | Drying Plant Stack | EPL Conc. Limits ($mg/m^3$) |
|---|---|---|---|---|---|---|---|
| Cyanide | g/s | 0.00852 | 0.00987 | - | - | - | 1 |
| Dioxins & Furans | g/s | 8.52E-10 | 9.87E-10 | - | - | - | $1x10^{-7}$ |
| Fine Particulates (PM10) | g/s | 0.08523 | 0.09871 | 0.20104 | 0.01953 | 0.06004 | 10 |
| Nitrogen Oxides | g/s | 0.85225 | 0.98706 | - | - | - | 100 |
| Polycyclic Aromatic Hydrocarbons | g/s | 0.00426 | 0.00494 | - | - | - | 0.5 |
| Sulfur Dioxide | g/s | 0.42613 | 0.49353 | - | - | - | 50 |
| Total Fluoride | g/s | 0.04261 | 0.04935 | - | - | - | 5 |

* See **Section 6.5.2.2** for discussion of emission rate calculation

#### 6.5.2.1 $NO_x$ Conversion to $NO_2$

Nitrogen oxides are produced in most combustion processes and are formed during the oxidation of nitrogen in fuel and nitrogen in the air. During high-temperature processes, a variety of oxides are formed including nitric oxide (NO) and $NO_2$. NO will generally comprise 95 % of the $NO_X$ by volume at the point of emission. The remaining $NO_X$ will consist of $NO_2$. Ultimately, however, all nitric oxides emitted into the atmosphere are oxidised to $NO_2$ and then further to other higher oxides of nitrogen.

This assessment adopted the conservative methodology for nitrogen oxide chemical transformation, which assumes that 100% of NO is converted to $NO_2$ in the atmosphere.

#### 6.5.2.2 Hazardous Elemental Metals & Speciated VOC's

Where there was no EPL Concentration limit listed in the Regain Tomago license for a number of the elemental metals and individual VOC species which are currently sampled for as part of the Regain Tomago EPL requirements, historical stack testing data was used to determine the percentage breakdown for each of these elemental metals and speciated VOC's. These percentages were then used to calculate a theoretical maximum emission rates expected for each of the individual substances based on the maximum licence concentration limits for the respective Type 1 & 2 Metals or Total VOC's. The percentage ratio's used in this assessment are provided in **Table 18** and **Table 19** below.

**Table 18 Type 1 & Type 2 Metals Percentage Breakdown**

| Type 1 & 2 Elemental Metals | Antimony | Arsenic | Chromium | Lead | Manganese | Mercury | Nickel |
|---|---|---|---|---|---|---|---|
| Percentage of Total Type 1 & 2 Metals* | 1.2% | 0.9% | 8.1% | 4.6% | 47.8% | 0.8% | 17.2% |

* The total percentage does not add up to 100% as some of the elemental Type 1 & 2 substances included in the analysis do not have associated ground level concentration limits, and as such have not been included in this assessment.

**Table 19 Speciated VOC's Percentage Breakdown**

| Individual VOC's Species | Acetone | Benzene | Toluene |
|---|---|---|---|
| Percentage of Total VOC's* | 43.8% | 4.1% | 52.2% |

* Based on historical testing, only the three VOC species listed in the table above returned a result above the detection limit of the method, and as such only these species have been used to calculate the percentage breakdown of the total VOC's.

This page has been left blank intentionally.

# 7.0 Modelling Results

The NSW EPA's assessment criteria for the assessed pollutants apply to both the 100$^{th}$ & 99.9th percentile for site-specific assessments, such as this AQIA. The data are presented for the respective pollutants of concern at the nearest sensitive receptor, or at/beyond the boundary as required by the *Approved Methods*.

## 7.1 Maximum Potential Operating Conditions (Current & Proposed EPL Concentration Limits)

The predicted maximum cumulative ground level concentrations for the maximum EPL concentrations scenario from the dispersion model are summarised in **Table 20**. The incremental impacts for each pollutant assessed in the modelling have also been expressed as a percentage of the criteria.

The maximum cumulative values are inclusive of the incremental impacts from the site, and the background values identified in **Section 4.1.5**.

**Table 20 Incremental & Cumulative Predicted Ground Level Concentrations (µg/m$^3$)**

| Pollutant | Averaging Period | Percentile | Assessment Location | Incremental GLC | Incremental % of Criteria | Background GLC | Cumulative GLC | GLC Criteria |
|---|---|---|---|---|---|---|---|---|
| Sulfur Dioxide ($SO_2$) | 1 hour | 100$^{th}$ | Nearest sensitive receptor | 27.30 | 4.8% | 214.8 | 242.10 | 570 |
| | 24 hours | 100$^{th}$ | | 5.28 | 2.3% | 73.4 | 78.68 | 228 |
| | Annual | 100$^{th}$ | | 0.61 | 1.0% | 9.8 | 10.41 | 60 |
| Nitrogen Dioxide ($NO_2$) | 1 hour | 100$^{th}$ | Nearest sensitive receptor | 54.60 | 22.2% | 92.1 | 146.70 | 246 |
| | Annual | 100$^{th}$ | | 1.22 | 2.0% | 16.9 | 18.12 | 62 |
| $PM_{10}$ | 24 hour | 100$^{th}$ | Nearest sensitive receptor | 3.87 | 7.7% | 43.30 | 47.17 | 50 |
| | Annual | 100$^{th}$ | | 0.41 | 1.6% | 18.70 | 19.11 | 25 |
| Lead | Annual | 100$^{th}$ | Nearest sensitive receptor | 0.00056 | 0.1% | N/A | N/A | 0.5 |
| Total Suspended Particulates | Annual | 100$^{th}$ | Nearest sensitive receptor | 0.70 | 0.8% | N/A | N/A | 90 |
| Hydrogen Fluoride | 90 days | 100$^{th}$ | Nearest sensitive receptor | 0.12 | 23.2% | 0.20 | 0.32 | 0.5 |
| | 30 days | 100$^{th}$ | | 0.16 | 18.9% | 0.81 | **0.97** | 0.84 |
| | 7 days | 100$^{th}$ | | 0.22 | 12.9% | 1.18 | 1.4 | 1.7 |
| | 24 hours | 100$^{th}$ | | 0.53 | 18.2% | N/A | N/A | 2.9 |

| Pollutant | Averaging Period | Percentile | Assessment Location | Incremental GLC | Incremental % of Criteria | Background GLC | Cumulative GLC | GLC Criteria |
|---|---|---|---|---|---|---|---|---|
| Cyanide | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.73 | 0.4% | N/A | N/A | 200 |
| Dioxins & Furans | 1 hour | 99.9$^{th}$ | At or beyond boundary | 7.28E-08 | 3.6% | N/A | N/A | 2.00E-06 |
| PAH | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.36 | 91.0% | N/A | N/A | 0.4 |
| Antimony | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0087 | 0.1% | N/A | N/A | 9 |
| Arsenic | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0064 | 7.1% | N/A | N/A | 0.09 |
| Cadmium | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0179 | 99.2% | N/A | N/A | 0.018 |
| Chromium | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.059 | 65.3% | N/A | N/A | 0.09 |
| Manganese | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.35 | 1.9% | N/A | N/A | 18 |
| Mercury | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.0056 | 0.3% | N/A | N/A | 1.8 |
| Nickel | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.13 | 70.0% | N/A | N/A | 0.18 |
| Acetone | 1 hour | 99.9$^{th}$ | At or beyond boundary | 6.38 | 0.03% | N/A | N/A | 22000 |
| Benzene | 1 hour | 99.9$^{th}$ | At or beyond boundary | 0.59 | 2.0% | N/A | N/A | 29 |
| Toluene | 1 hour | 99.9$^{th}$ | At or beyond boundary | 7.60 | 2.1% | N/A | N/A | 360 |

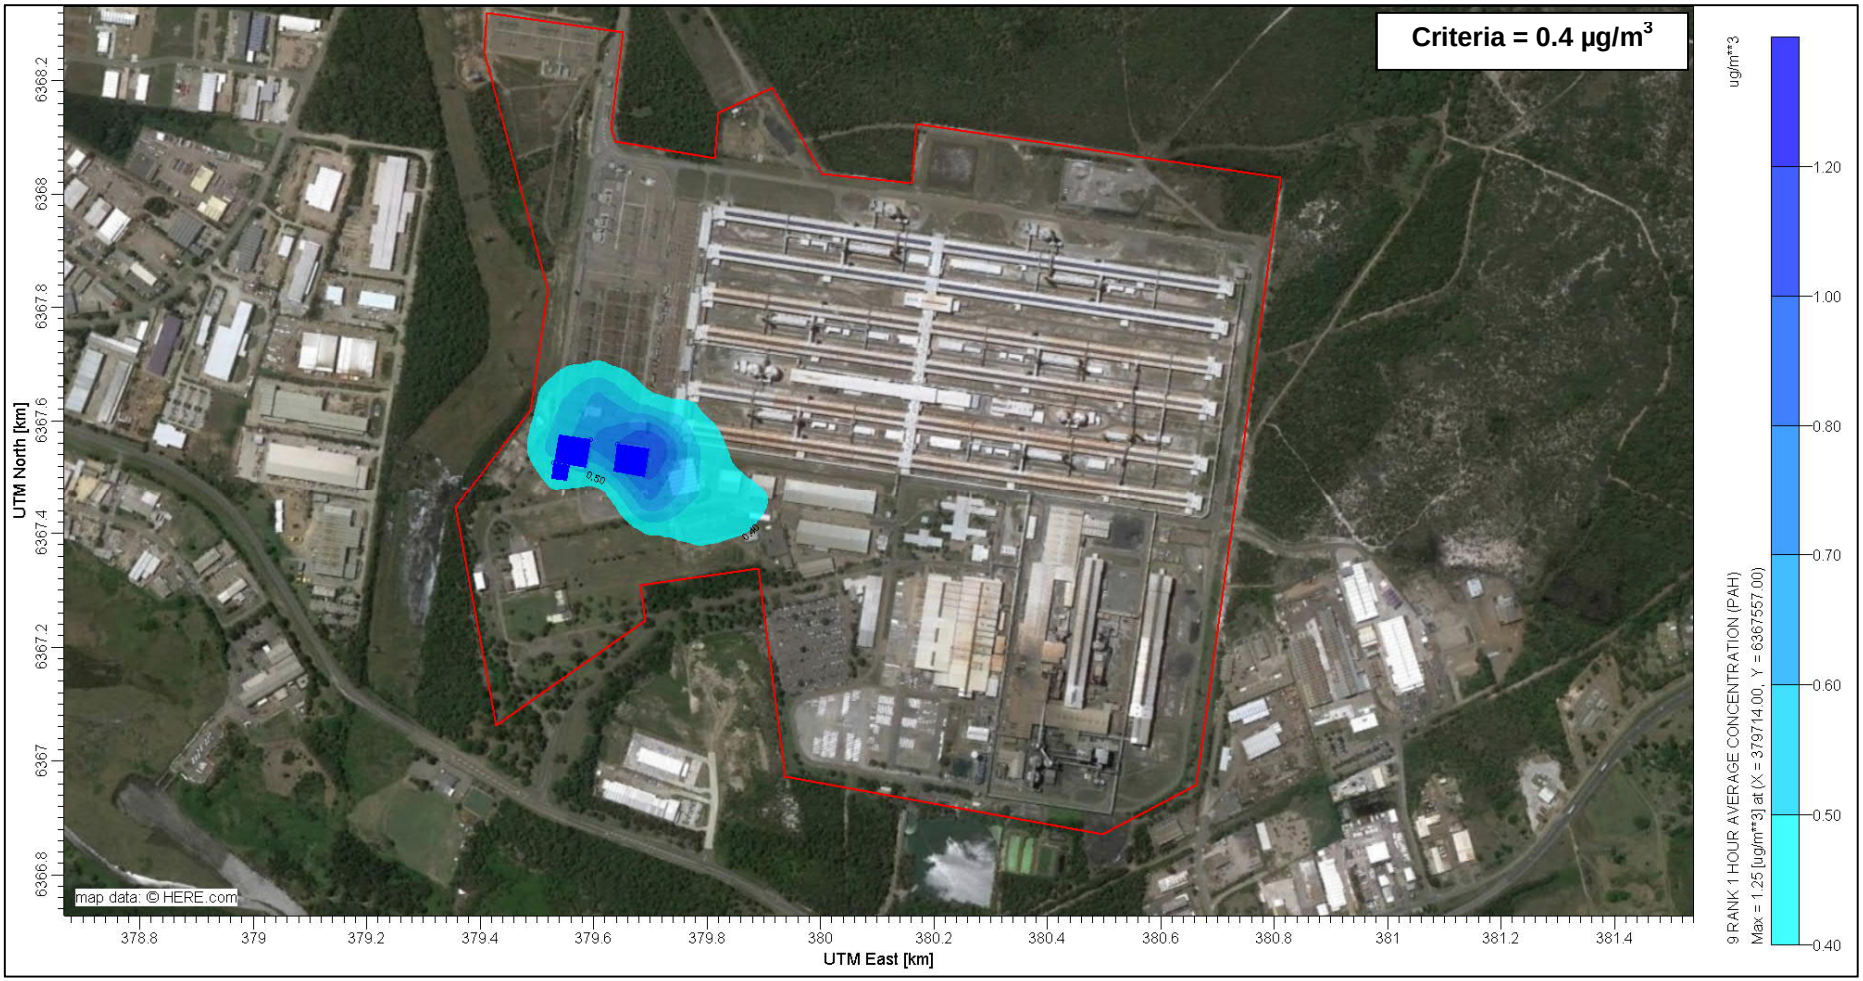

**Figure 8 Maximum Incremental PAH Isopleth 99.9th Percentile**

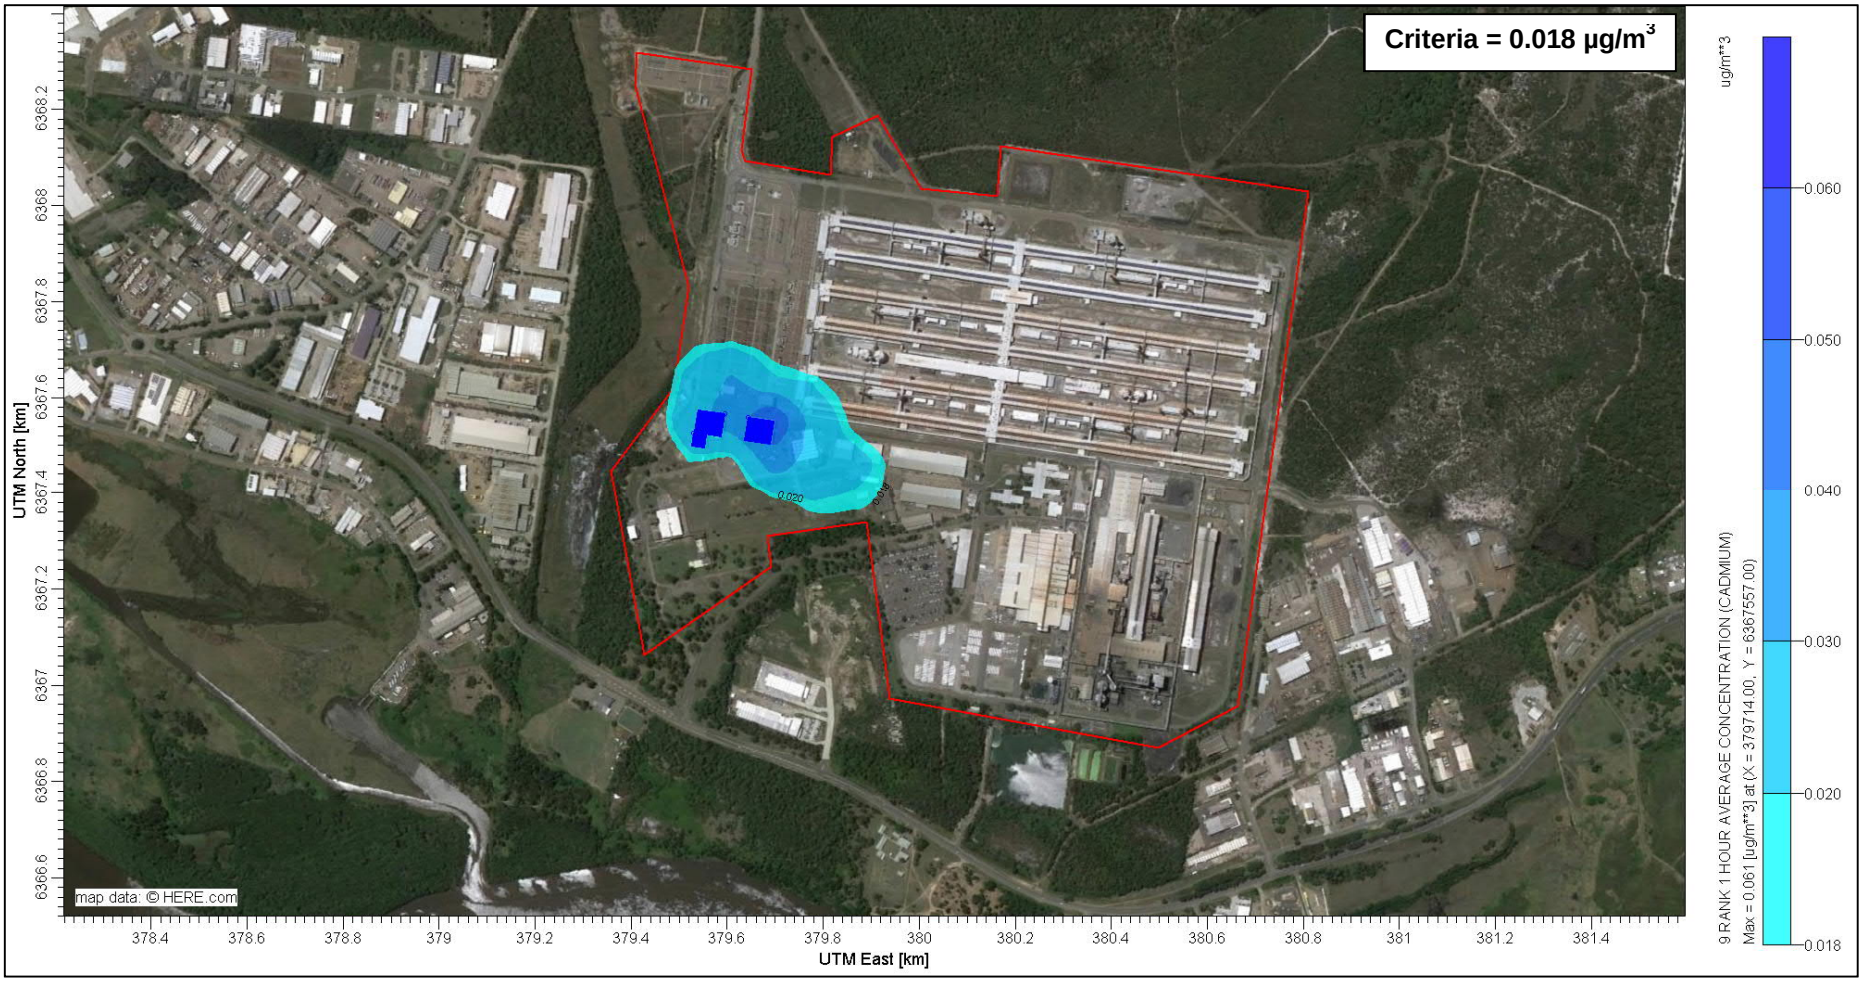

**Figure 9 Maximum Incremental Cadmium Isopleth 99.9th Percentile**

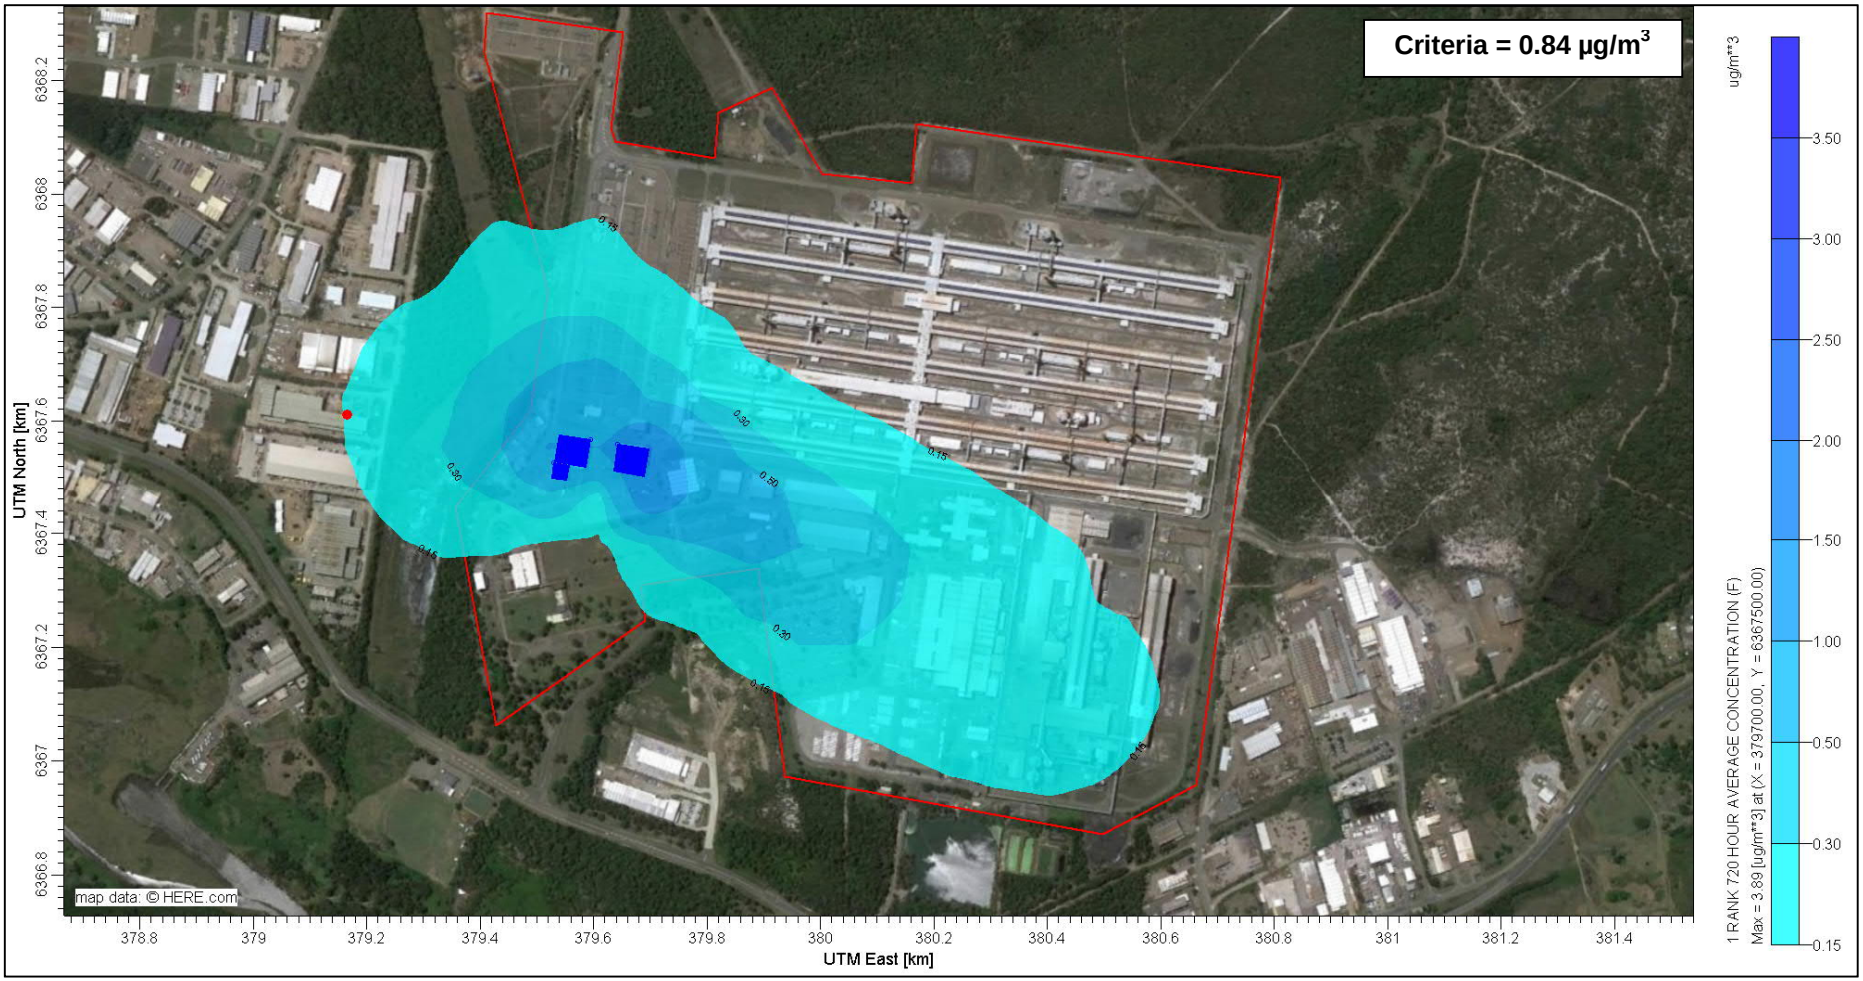

**Figure 10 Maximum Incremental 30-day (720-hour) Hydrogen Fluoride Isopleth 100th Percentile**

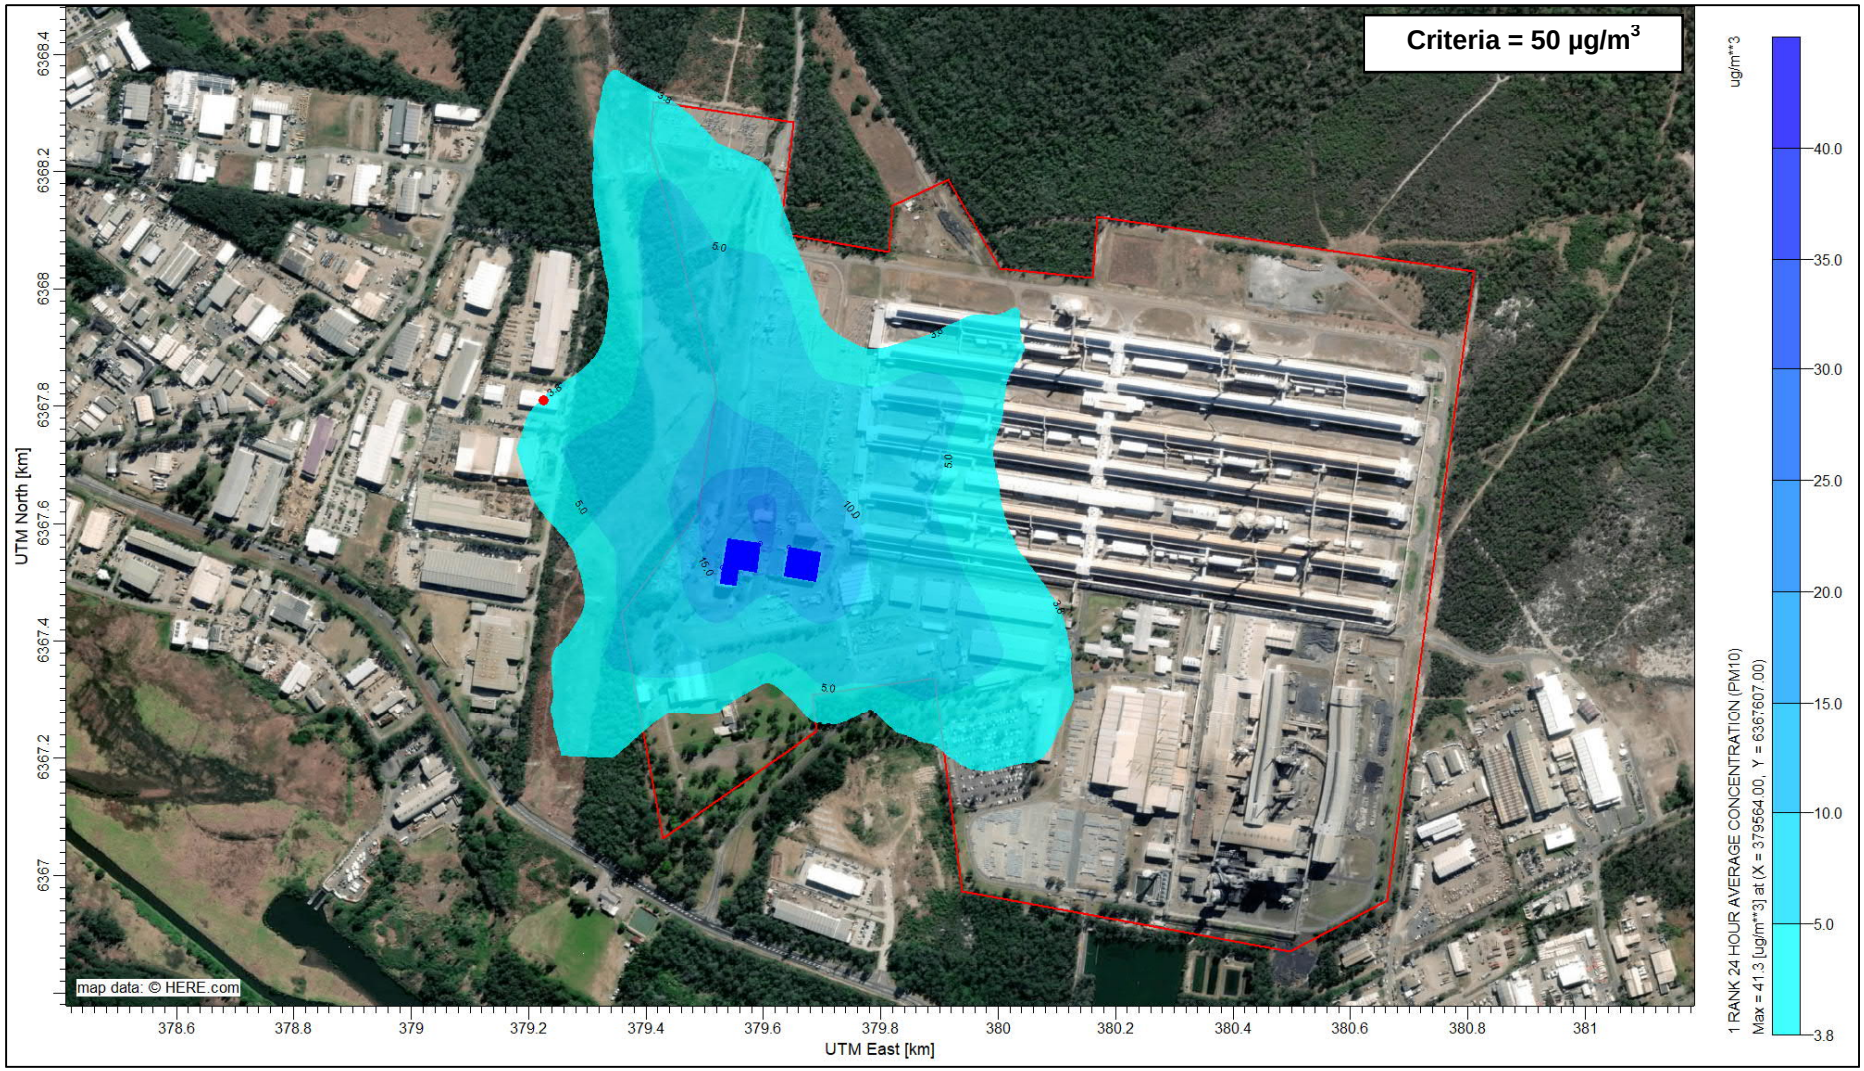

**Figure 11 Maximum Incremental 24-Hour $PM_{10}$ Isopleth 100th Percentile**

As shown, the predicted maximum cumulative pollutant concentrations were all compliant with their respective GLC assessment criteria, with the exception to of the 30-day Hydrogen Fluoride result. The following observations can be made:

- The incremental PAH concentration of 0.36 µg/$m^3$, and the Cadmium concentration of 0.0179 µg/$m^3$, represent the pollutants with their GLC closest to thetheir respective EPA criterion (0.4 µg/$m^3$ and 0.018 µg/$m^3$ respectively). The predicted incremental PAH & Cadmium isopleths are provided in **Figure 8** and **Figure 9** respectively. The isopleths show that the maximum incremental GLC's are located on the western boundary approximately 200m from the Regain facility. Based on the emissions inventory, the two rotary kilns are the main source of these pollutants; and
- The pollutants with the highest cumulative concentrations when compared to the NSW EPA criteria were Hydrogen Fluoride & $PM_{10}$. Hydrogen Fluoride has the highest cumulative result for the 30-day averaging period of 0.97 µg/$m^3$ when compared to the criteria of 0.84 µg/$m^3$. The cumulative 24-hour $PM_{10}$ result was the second highest, at47.17 µg/$m^3$, when compared to the criteria of 50 µg/$m^3$. The predicted incremental Hydrogen Fluoride & $PM_{10}$ isopleths are presented in **Figure 10** and **Figure 11** below. The isopleths show that the maximum cumulative GLCs are located at one of the sensitive receptors approximately 500m to the west of the Regain facility.

  Whilst the cumulative impacts for these pollutants are notable, and in the case of Hydrogen Fluoride being elevated above the GLC criteria, the incremental Hydrogen Fluoride and $PM_{10}$ Regain contributions at the same location are small at 0.16 µg/$m^3$ and 3.87 µg/$m^3$, well below their respective criteria.

## 7.2 Results Comparison with 2009 Environmental Assessment

A summary of the predicted incremental and cumulative ground level concentrations for the Project are provided in **Table 21**, with the results from the previous ENSR (2009) EA included for comparison. It must be recognised that the 2009 EA used actual expected pollutant concentrations as opposed to the maximum current or proposed emission concentration limits adopted for this assessment to demonstrate a 'worse-case' scenario.

**Table 21 Incremental Results Comparison - 2009 Environmental Assessment**

| Pollutant | Averaging Period | 2009 EA (20,000 tpa)[1] | | 2018 DA Modification (60,000 tpa EPL Limits)[2] | | Criteria (µg/m$^3$) |
|---|---|---|---|---|---|---|
| | | Incremental Results | Cumulative Results | Incremental Results | Cumulative Results | |
| Sulfur Dioxide ($SO_2$) | 1 hour | 0.09 | **572.1** | 27.30 | 242.10 | 570 |
| | 24 hours | 0.02 | 217.4 | 5.28 | 78.68 | 228 |
| Nitrogen Dioxide ($NO_2$) | 1 hour | 0.92 | 126.9 | 54.60 | 146.70 | 246 |
| | Annual | 0.03 | 28 | 1.22 | 18.12 | 62 |
| $PM_{10}$ | 24 hour | 3.2 | **91.2** | 3.87 | 47.17 | 50 |
| | Annual | 0.33 | 21.3 | 0.41 | 19.11 | 25 |
| Total Suspended Particulates | Annual | 0.77 | 53.2 | 0.70 | N/A | 90 |
| Hydrogen Fluoride | 90 days | 0.009 | **2.91** | 0.12 | 0.32 | 0.5 |
| | 7 days | 0.016 | **5.5** | 0.22 | 1.4 | 1.7 |
| | 24 hours | 0.04 | N/A | 0.53 | N/A | 2.9 |
| Cyanide | 1 hour | 0.27 | N/A | 0.73 | N/A | 200 |
| PAH's | 1 hour | 0.0094 | N/A | 0.36 | N/A | 0.4 |
| Dioxins & Furans | 1 hour | $8.8x10^{-10}$ | N/A | $7.28x10^{-8}$ | N/A | $1.0x10^{-6}$ |

[1] Results reported were the respective maximums across the whole modelling domain
[2] Results reported are either at a sensitive receptor location offsite, or at or beyond the site boundary in accordance with the *Approved Methods*.
N/A = Background data not available

When comparing the incremental results from this assessment, with those reported in the ENSR (2009) EA it can be seen that increasing the production rate from 20,000 tpa to 60,000 tpa, corresponds to an increase in the predicted ground level concentrations for most of the assessed pollutants. The incremental ground level concentrations resulting from Regain operations are all well below the relevant ground level concentration criteria, with the cumulative results also demonstrating compliance.

When comparing the results from this AQIA with the previous ENSR (2009) EA, the following should be noted:

- The model used in this assessment was the CALPUFF model (in accordance with the *Approved* Methods) compared to AUSPLUME used in 2009, which calculates the dispersion of pollutants differently, and can result in varying results between the two models. CALPUFF is the currently recognised model for use by the NSW EPA for this Project.

- A more recent and representative meteorological year (2015) and ambient pollutant background data set was used for this assessment in comparison to the 2008 data used in the ENSR (2009) EA. Ambient background pollutant concentrations can vary significantly year to year depending on a number of factors in the local area, which may include (but not limited to) the following:
  - The location of the ambient monitoring stations and the sampling equipment used;
  - Natural events, such as bushfires and dust storms;
  - Industries improving their environmental emissions controls;
  - New industries operating in the area, or sites ceasing operations; and
  - Increase or decrease in traffic volume through the area.

  The ambient pollutant background year selected for this assessment was done to be consistent with the updated meteorological dataset used in the modelling, which is more consistent with current expected background concentrations than a dataset for 10 years prior.
- The input data used in this assessment is based on the maximum currently approved and proposed EPL concentration limits, as opposed to a single data set at average operational conditions used in the ENSR (2009) AQIA. Based on years of historical stack emissions testing data from the Regain facility, it is considered that adopting the maximum EPL concentration limits to determine the mass emission rates for the Project is a very conservative approach. Typical operations of the Regain facility have demonstrated that all stack pollutant concentrations levels are well below the listed EPL Limits.
- In this assessment, in accordance with the current *Approved Methods*, the ground level impact has been assessed at offsite sensitive receptors, or at/beyond the Tomago Aluminium site boundary which the Regain facility operates within. The ENSR (2009) assessment reported the maximum ground level concentrations across the whole modelling domain, which fell within the Tomago Aluminium site boundary.

Whilst the incremental ground level concentration results for the increase in production capacity of the Project show an increase in the potential ground level concentrations of the assessed pollutants, when examining the cumulative impacts, there is no predicted cumulative increase compared to the original EA (2009). Therefore potential air quality impacts associated with the current proposed modification are likely to remain substantially the same as the original approved development.

This page has been left blank intentionally.

# 8.0 Modelling Results Summary

This assessment predicts that when considered in isolation (incremental concentration only), no adverse impacts are likely to occur as a result of the facility operating under proposed maximum operational conditions at or beyond the site boundary or at any sensitive receptor location. When considered cumulatively with background concentrations, there is a potential exceedance of the GLC criteria for the 100$^{th}$ percentile 30-day Hydrogen Fluoride concentration in Scenario 1.

The potential for cumulative fluoride exceedances exist due to elevated background concentrations of fluoride, likely related to the operation of the Aluminium smelter. The location of sensitive receptors recording modelled elevated cumulative ground level concentrations for Hydrogen Fluoride are located approximately 200m to the west of the Regain facility, beyond the Tomago Aluminium boundary. These receptors are located within the nearby industrial estate, which fall within the Tomago Aluminium buffer zone. Guidance from the ANZECC (1990) document from which the NSW EPA limits are derived, indicates that the intent of the ambient fluoride criteria was for application at receptors where sensitive vegetation or grazing animals are located. Neither of these sensitive receptor types are present at the industrial receptors identified as having cumulative concentrations above the criteria in this assessment.

The increase in incremental Fluoride concentrations associated with the Regain operations are predicted to be only 0.16 µg/m$^3$ at these industrial receptor locations and as such are unlikely to cause any significant additional environmental impact beyond the elevated background concentrations already present in the environment. As such, the assessment indicates that the proposed modification to the Regain facility is not predicted to cause any potential increase in environmental harm associated with any of the pollutants examined in this AQIA when operating at the maximum permitted stack concentration limits.

This page has been left blank intentionally.

# 9.0 Operational Mitigation Measures

The following section provides a discussion of operational mitigation measures related to air quality, currently adopted at the Regain facility. The same measures are proposed to be implemented for the additional 40kT per annum Rotary Kiln/Dryer. These mitigation measures were implemented by Regain to minimise air pollutant emissions from their facility.

## 9.1 SPL Handling and Preparation

Preparation of SPL for thermal treatment including handling, sorting, crushing, sizing and stockpiling would be conducted in a building with roller shutter doors that could be opened and closed, as required, along with dust extraction and gas filtering equipment to manage potential dust escape from the preparation and storage area. This approach would contain any generated dust within the confines of the building. Process equipment such as conveyors, crushers and grinding mills would be enclosed to prevent dust release from the process plant.

## 9.2 Enclosed External Plant

External plant elements are not in a covered building, however would be enclosed such, that there would be no open material transfer points. External plant would be connected to dust extraction, filtration and control equipment such that air pressure with the process plant would be lower than atmospheric pressure thus preventing fugitive dust escape from the process plant.

## 9.3 Dust Extraction

The operation of loading SPL to the process circuit has the potential to liberate dust into the atmosphere within the building. This dust has the potential to escape from vents and doors that may be open from time to time. Dust control from the facility would occur via the following five independent dust extraction and collection points:

1. 20kT thermal treatment plant dust collector;
2. 40kT thermal treatment plant dust collector;
3. Drying plant dust collector;
4. SPL Shed 5 and Deline facility air filter (SPL preparation facilities); and
5. Proposed fine grinding mill dust collector.

Ductwork would be installed throughout the process plant system and connected to dust generating areas such as mills, crushers, conveyors, storage bins and the kiln/dryer. The dust extraction system would maintain a slightly negative pressure within the building, ensuring air is always drawn into the building through any openings (e.g. ventilation louvers, roller doors, etc.), preventing the escape of fugitive dust.

Each dust extractor would be fitted with a filter bag unit to remove the dust from the extracted air streams. Particulate concentrations within exhausted air from the dust extractors would be below permissible licence levels. Collected particulate matter would be returned to the production cycle.

## 9.4 Alarms & Shut Down

The building dust extraction system, including filter bags, would be fitted with a visual and audible alarm system that would sound within the plant buildings to immediately shut down plant operations in the event that the dust extraction failed.

## 9.5 Baghouse Temperature Monitoring

The alarm system would be triggered by temperature probes installed in the baghouses that would alarm and shut down the plant if the inlet gas temperature to the baghouses exceeded 130$^{o}$C.

## 9.6 Rotary Kiln Temperature Control and Safety Design

The key process control for the rotary kilns would be temperature control via the burner management system. The product temperature in the kiln would be measured using thermo-couples connected to a digital control system. The burner management controls would maintain the required temperature. Independent High/Low temperature monitoring and alarms would be installed on the system. The rotary kilns would also be fitted with blast panels to ensure that, in the unlikely event of explosion, damage to the kiln shell would be minimised.

## 9.7 Burner Management

The plant would be fitted with a burner management system that would be designed in accordance with AS1853 ("Automatic Oil and Gas Burners: Mechanical Draught", Standards Association of Australia, Sydney, 1983). This standard requires burners to be fitted with isolation valves and flame detectors. In the event of a "flame-out", the flame detector would activate and the gas isolation valve would close.

## 9.8 Treated Product (HiCAl) Handling

Once treated in the kiln, the product is transferred via an enclosed conveyer system to the Shed 6 storage building which opens to the environment via two large roller doors, which can accommodate a front end loader. The dry material is wetted inside the storage building to achieve a moisture content of approximately 5-7%, to minimise the potential for the generation of dust, particularly during bulk truck loading operations.

Truck loading operations take place within the bunded courtyard area between the two large sheds at the Regain facility, whereby the front end loader collects product from Shed 6, and loads the truck outside. Loading activities only taking place during dry weather, with any spillages cleaned up and the loading area swept regularly to maintain good housekeeping practices. Trucks are covered upon completion of the loading activities before the leave the Regain facility.

The bunded courtyard area drains directly to the Regain facility stormwater recycling system, which prevents the potential for material to enter any stormwater drains.

## 9.9 Emissions Testing

The Regain Tomago Environment Protection License (EPL) No. 13269 currently requires stack emissions testing of EPL Point 1 (20,000 tpa Rotary Kiln stack) to be undertaken on a biannual basis whilst processing both 1$^{st}$ Cut and 2$^{nd}$ Cut SPL.

With the installation of the new plant, and operation of five point sources onsite, Regain propose to conduct licensed testing as outlined in **Table 22**, with operational EPL Concentration Limits as outlined in **Table 15**.

**Table 22 Proposed EPL No. 13269 Emissions Testing**

| EPL Point | Stack Name | Feed Material | Frequency | Pollutants |
|---|---|---|---|---|
| 1 | 20,000 tpa Rotary Kiln Discharge Stack | 1st Cut & 2nd Cut | Biannual | Nitrogen Oxides<br>Type 1 & 2 Substances<br>Fine Particulates ($PM_{10}$)<br>Polycyclic Aromatic Hydrocarbons (PAH)<br>Sulfur Dioxide<br>Dioxins & Furans<br>Total Solid Particulates (TSP)<br>Cyanide<br>Total Fluoride<br>Cadmium<br>Volatile Organic Compounds |
| 2 | Drying Plant Discharge Stack | Any | Biannual | Total Solid Particulates (TSP)<br>Fine Particulates ($PM_{10}$) |
| 3 | Shed 5 Discharge Stack | Any | Biannual | Total Solid Particulates (TSP)<br>Fine Particulates ($PM_{10}$) |
| 4 (Proposed) | 40,000 tpa Rotary Kiln Discharge Stack | 1st Cut & 2nd Cut | Biannual | Nitrogen Oxides<br>Type 1 & 2 Substances<br>Fine Particulates ($PM_{10}$)<br>Polycyclic Aromatic Hydrocarbons (PAH)<br>Sulfur Dioxide<br>Dioxins & Furans<br>Total Solid Particulates (TSP)<br>Cyanide<br>Total Fluoride<br>Cadmium<br>Volatile Organic Compounds |

# 10.0 Greenhouse Gas Assessment

## 10.1 Methodology

A greenhouse gas assessment was undertaken in accordance with the requirements outlined in the SEAR's and the *Australian National Greenhouse Accounts; National Greenhouse Accounts Factors, July 2017*. The assessment provides a qualitative assessment of GHG emissions during operation of the Regain facility and a qualitative analysis of the facilities relative contribution to national greenhouse emissions.

## 10.2 Key Definitions and Terms

### 10.2.1 Greenhouse Gases Global Warming Potentials

The Global Warming Potential (GWP) is an index used to convert relevant non-carbon dioxide gases to a carbon dioxide equivalent ($CO_2^{-e}$) by multiplying the quantity of the gas by its GWP. GWPs for common greenhouse gases are presented in **Table 23**.

**Table 23 Global Warming Potentials (Australian Government 2014)**

| GHG Gas | Global Warming Potential |
|---|---|
| Carbon Dioxide (CO2) | 1 |
| Methane (CH4) | 21 |
| Nitrous Oxide (N2O) | 310 |
| Hydrofluorocarbons (HFCs) | 140-11,700 |
| Perfluorocarbons (PFCs) | 6,500-9,200 |
| Sulphur hexafluoride ($SF_6$) | 23,900 |

### 10.2.2 Direct and Indirect Emissions

Direct emissions are produced from sources within the boundary of an organisation and as a result of the organisations activities. These include generation of energy or electricity, manufacturing processes that produce emissions, transportation of materials, fugitive emissions and onsite waste management (Australian Government 2017).

Indirect emissions are emissions generated in the wider economy as a consequence of organisations activities that are physically produced by the activities of another organisation. This includes consumption of electricity, upstream emissions generated in the extraction and production of fossil fuels, downstream emissions from transport of an organisations product to customers and emissions from contracted and outsourced activities (Australian Government 2017).

### 10.2.3 Types of Emission Factors

Emission factors are activity specific and the activity being undertaken defines the emission factor used. The scope that emission factors are reported under is determined by whether the activity is within the organisations boundary or outside it and is defined as follows:

- **Scope 1:** All direct GHG emissions; and
- **Scope 2:** Indirect GHG emissions from the consumption of purchased electricity.

## 10.3 GHG Impact Assessment

The following section provides a summary of the greenhouse gas emissions related to the project.

### 10.3.1 Emissions Estimation

**Table 24** provides a breakdown of the Scope 1 and Scope 2 emissions during operation of the existing and proposed augmentation of the facility. Due to both the wide distribution of upstream and downstream users and cyclic nature of the pot production for the aluminium smelting process which produces the SPL that Regain use as a feed material Scope 2 has been limited to electricity consumption only, and Scope 3 items have been excluded entirely.

It can be seen from **Table 24** there would be an increase in the GHG emissions from the existing to the proposed operations with estimated total GHG emissions changing from 1,611 $CO_2^{-e}$t/y to4,834 $CO_2^{-e}$ t/y. This is largely attributed to the operation of the additional rotary kiln, increasing production from 20 kT/y to 60 kT/y.

When predicted GHG emissions from the proposal are compared to state and national GHG emissions for 2016, the facilities contribution is relatively small, contributing 0.0044% of NSW, GHG emissions and 0.0011% of national emissions[5] accounting for Scope 1 and Scope 2 emissions.

**Table 24 Existing and Proposed GHG Emissions ($CO_2^{-e}$t/y)**

| Source | Type | Current Production (20 kT/y) | | Proposed Production (60 kT/y) | |
|---|---|---|---|---|---|
| | | Qi Value | Emissions ($CO_2$-e t) | Qi Value | Emissions ($CO_2$-e t) |
| Natural gas consumption | Scope 1 | 24000 | 1237 | 72000 | 3710 |
| Diesel (Vehicles) | Scope 1 | 40 | 109 | 120 | 327 |
| Electricity consumption | Scope 2 | 320000 | 266 | 960000 | 797 |
| **Total** | | | **1611** | | **4834** |

### 10.3.2 GHG Emission Intensity

The intensity of greenhouse emissions from the project (per unit of production) has been estimated from the total GHG emissions under existing and proposed operations. These results are shown in **Table 25**. It can be seen from **Table 25** that the under the proposal the GHG emission intensity is predicted to be maintained, as the production process has not been altered, only increased in capacity from 20kT to 60kT per annum.

**Table 25 Emission Intensity per Unit of Production**

| Operation | Production Rate (kT/y) | GHG Emissions (CO2e- t/y) | CO2e- t/t |
|---|---|---|---|
| Existing (20 kT/y) | 20 | 1,611 | 0.081 |
| Proposed (60 kT/y) | 60 | 4,834 | 0.081 |

## 10.4 Proposed Safeguards

During operations of the Regain facility safeguard measures would include ensuring all mobile and plant equipment is well maintained, limiting haul routes, and light oil usage and undertaking an energy audit for the site to identify potential energy efficiency opportunities.

[5] National Greenhouse & Energy Reporting (http://www.cleanenergyregulator.gov.au/NGER/National%20greenhouse%20and%20energy%20reporting%20data/Data-highlights/2016-17-published-data-highlights), Accessed 7 August 2018

# 11.0 Conclusion

This air quality impact assessment was undertaken for the proposed capacity increase modification to the Regain facility located within the Tomago Aluminium site at Tomago, NSW. The proposed modification includes increasing the processing capacity of the site from 20,000 tpa to 60,000 tpa , by the addition of a 40,000 tpa Rotary Kiln, as well as construction of a Fine Grinding Plant. The main emissions of concern for this assessment associated with the proposed Regain operations include a range of primary air pollutants and principal air toxic substances, released during the thermal treatment of SPL.

The air quality assessment examined the existing air quality and local meteorology, outlined the relevant air quality standards and guidelines, detailed the assessment methodology through the use of the air dispersion model CALPUFF and considered the effects on air quality from the potential operational emissions.

The assessment indicates that the proposed modification to the Regain facility in isolation from background pollutant sources is not likely to result in any exceedances of the ground level concentration criteria for any pollutants assessed in this AQIA. Although there was a cumulative exceedance of the short term 30-day Hydrogen Fluoride criteria predicted by the modelling, it is principally the result of the high background levels of ambient fluoride associated with the operation of the aluminium smelter within which the Regain facility is located. Additionally, the industrial location of the receptors which may potentially exceed the criteria are unlikely to be impacted by the marginally increased levels of ambient fluoride associated with the Regain contribution as there are no sensitive flora or grazing animals present.

A GHG inventory was also prepared as part of this assessment, which predicts an increase in GHG emission intensity associated with the increased production capacity, however the facilities overall contribution is very small to the state and national GHG emissions, and not expected to be of concern.

It is recommended that Regain apply the same operational mitigation measures currently in place at the facility for the 20,000 tpa rotary kiln to the additional 40,000 tpa rotary kiln to ensure the facility is able to minimise any potential for environmental harm. Additionally, post-commissioning of the site modifications, it is recommended that Regain undertake a validation assessment, which includes emissions monitoring of all sources and a validation model to address any variations between this assessment and the operational plant. Biannual emissions monitoring should be undertaken for all point source locations once they are all installed and operational to continually demonstrate compliance with currently licensed (and proposed) EPL concentration limits.

# Appendix B

## CALMET Meteorological Data Review

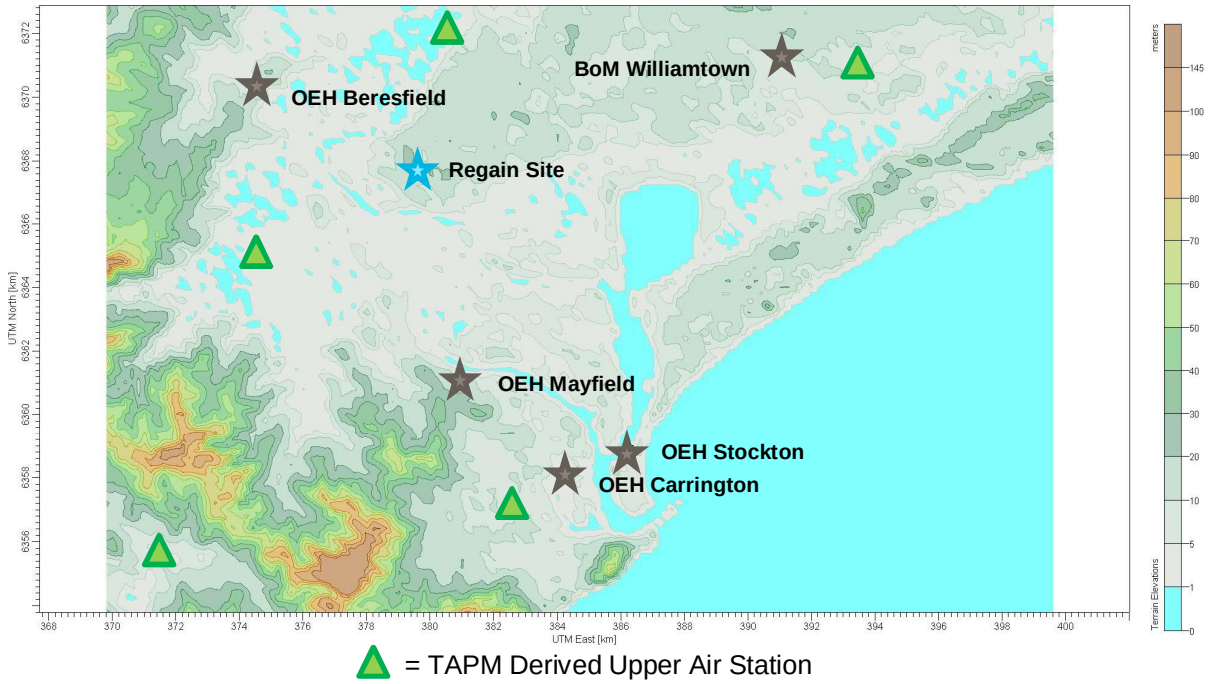
# Appendix B CALMET Meteorological Data Review

## Overview

This section presents a summary of CALMET model predictions at the Site, with reference against observations recorded at the Office of Environment & Heritage (OEH) Beresfield Automatic weather station. This AWS constitutes the closest observations station within the modelling domain, which has all required data for verification, along with a similar location close to the Hunter River, being located approximately 5.8 km northwest from the Site. Given the similarities in topography between the observation site and the Regain site (refer to **Table 28**), minimal differences are expected between the examined locations, and general meteorological trends should be comparable. Accordingly, this section includes a review of the meteorological data in the contexts of expected meteorological behaviours.

**Table 28 Terrain Elevations of Meteorological Grid showing Surface & Upper Air Stations**

**Terrain and Surface Stations**



## Winds

Wind predictions have been extracted from CALMET at the Regain Tomago Site (hereafter referred to as CALMET Regain) for reference against regional observations. **Table 29** presents a summary of wind speed statistics. **Table 31** to **Table 33** present wind roses at the OEH Beresfield and CALMET Regain, with wind frequency data shown in **Table 34**.

The wind speed statistics in **Table 29** suggest that the CALMET Regain data show considerable similarities with the BOM data.

**Table 29 Regional Wind Statistics Comparison 2015**

| Wind Parameters | OEH Beresfield | CALMET Regain |
|---|---|---|
| Minimum (m/s) | 0.0 | 0.0 |
| Average (m/s) | 2.5 | 2.81 |
| Maximum (m/s) | 14.1 | 14.5 |
| Calms (%) (<0.5m/s) | 4.1 | 4.0 |

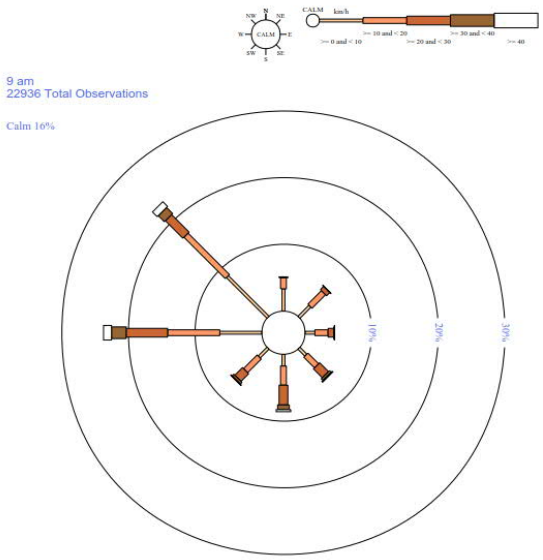
The annual wind roses in **Table 30** show similar general wind directions for both data sets, with winds blowing predominantly from the northwest, attributed to winds blowing down to the coast from the Hunter Valley region. Both meteorological data sets show similar overall wind speeds, and distribution. Both wind pattern data are common for the Hunter Valley region.

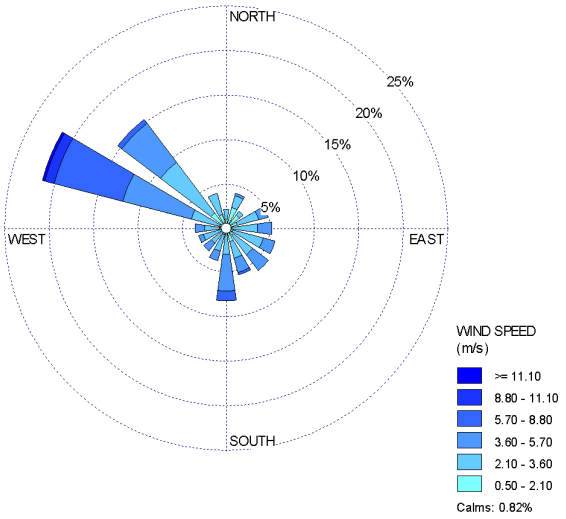
**Table 30 Annual Wind Rose Comparison 2015**

| OEH Beresfield | CALMET Regain |
|---|---|
|  |  |

**Table 31 9am and 3pm Wind Rose Comparison CALMET Regain 2015 to Long Term BOM Williamtown**

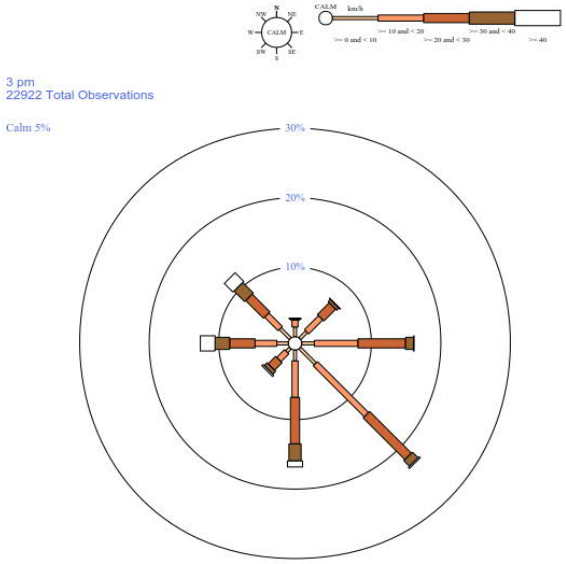
## 9am Wind Rose

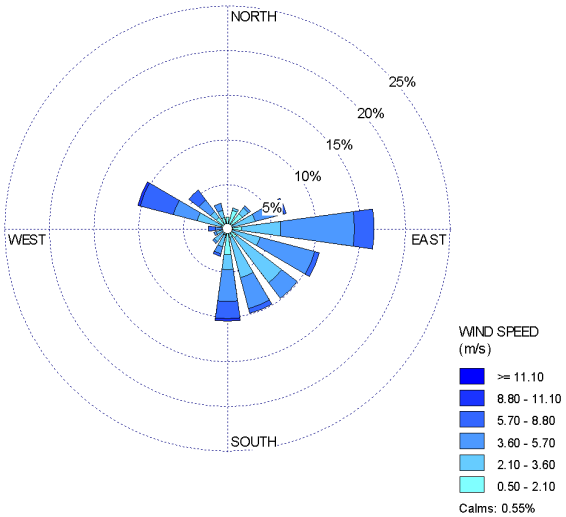




BoM Williamtown | CALMET Regain

## 3pm Wind Rose





BoM Williamtown | CALMET Regain

*Note – The BoM data is presented in km/hr, however WRPLOT View can only present data in m/s

The Bureau of Meteorology (BoM) Williamtown meteorological station was used for the long term wind rose comparison, as it is the closest local station to the site with the available long term data. The 9am and 3pm wind roses presented in **Table 31** show a good general correlation. The 9am data for both have strong Northwest portions, although BoM Williamtown has a greater proportion of winds from the west as CALMET Regain is more affected by the expected north westerly winds blowing down the valley towards the site. For the 3pm data both locations have consistent wind directions, with a high easterly portion attributed to the sea breeze blowing from offshore in the afternoon.

**Table 32 Summer and Autumn Wind Rose Comparison 2015**

| Summer Wind Rose | |
|---|---|
|  |  |
| OEH Beresfield | CALMET Regain |
| **Autumn Wind Rose** | |
|  |  |
| OEH Beresfield | CALMET Regain |

The summer and autumn data in **Table 32** show similar wind direction patterns, as would be expected for two sites being located within similar terrain, and around 5km of each other. In the summer both datasets show a higher proportion of winds from the east, with the winds in Autumn generally blowing from the northwest.

**Table 33 Winter and Spring wind rose comparison 2015**

| Winter Wind Roses | |
|---|---|
|  |  |
| OEH Beresfield | CALMET Regain |
| **Spring Wind Roses** | |
|  |  |
| OEH Beresfield | CALMET Regain |

The winter and spring data in **Table 33** show similar wind direction patterns. In the winter, both datasets show a high percentage of winds originating from the northwest, whereas in the spring, both datasets show more even wind distribution, with a tendency of winds blowing from the northwest and southeast quadrants.

**Table 34 Wind Speed Frequency Distributions Comparison 2015**

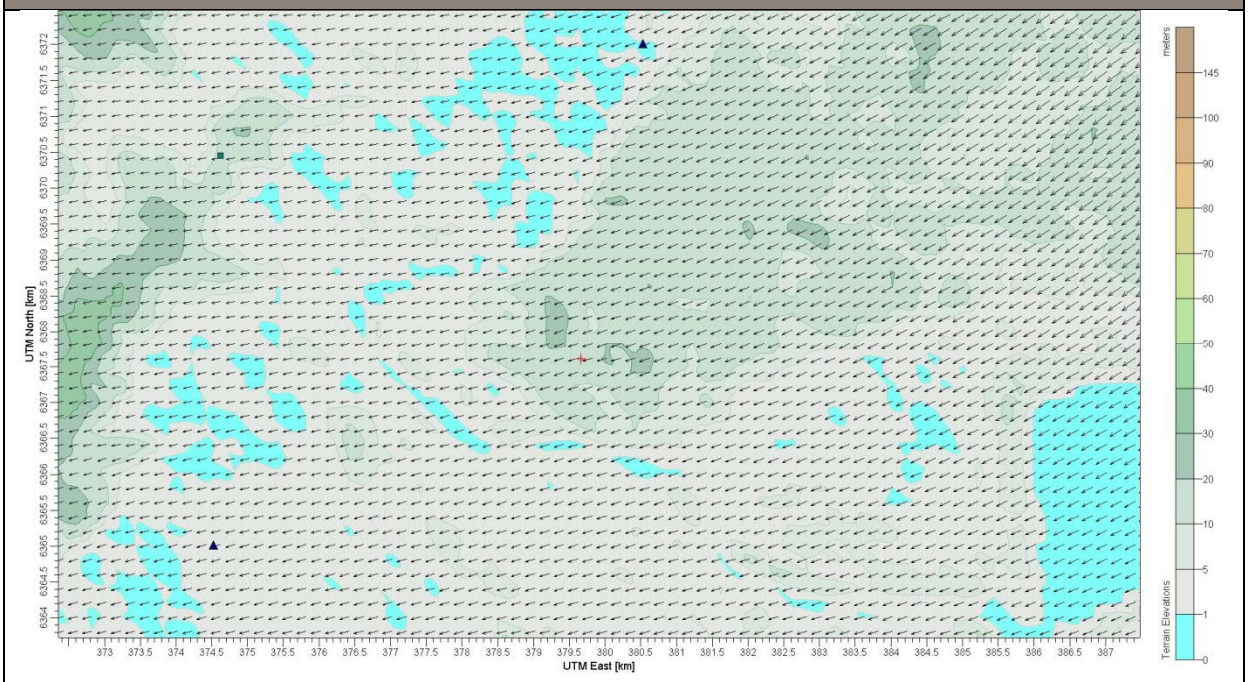
| Wind Class Frequency | |
|---|---|
|  |  |
| OEH Beresfield | CALMET Regain |

The wind speed frequencies presented in **Table 34** show very similar trends between the two datasets, with the winds being predominantly light to moderate in nature. The OEH Beresfield data shows a higher percentage of light winds and lower moderate winds compared to the CALMET Regain data, however this is expected due to that surface station being located 5.7km further inland from the more coastal CALMET Regain site.

Example wind fields were selected based on an hour of day when stable atmospheric conditions (class F) dominated and were selected to represent the middle of each season. This period was examined as it represents the period when worst case dispersion is likely to occur and when it is critical that the wind fields be performing well. The selected wind fields are shown in **Table 35** and **Table 36**.

**Table 35 Selected 2015 Wind Fields for the Regain CALMET Modelling Domain**

**Year: 2015 Month: 01 Day: 01 Hour: 19**



**Year: 2015 Month: 04 Day: 13 Hour: 23**

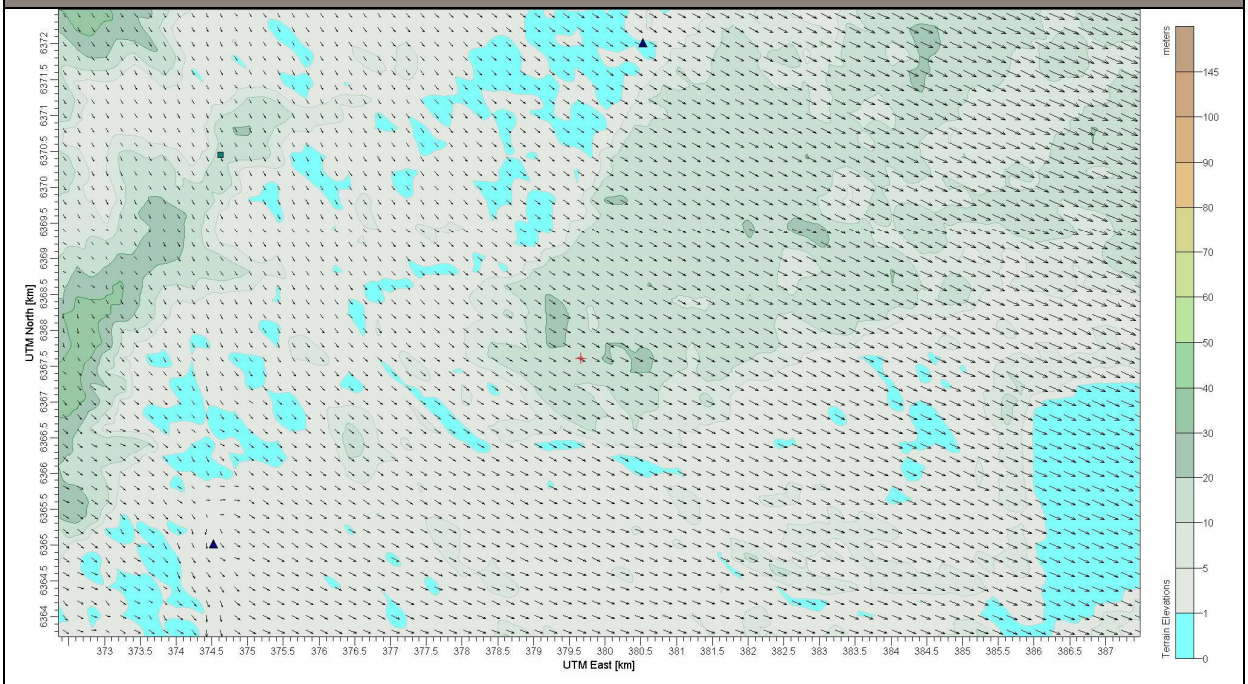


**Table 36 Selected 2015 Wind Fields for the Regain CALMET Modelling Domain**

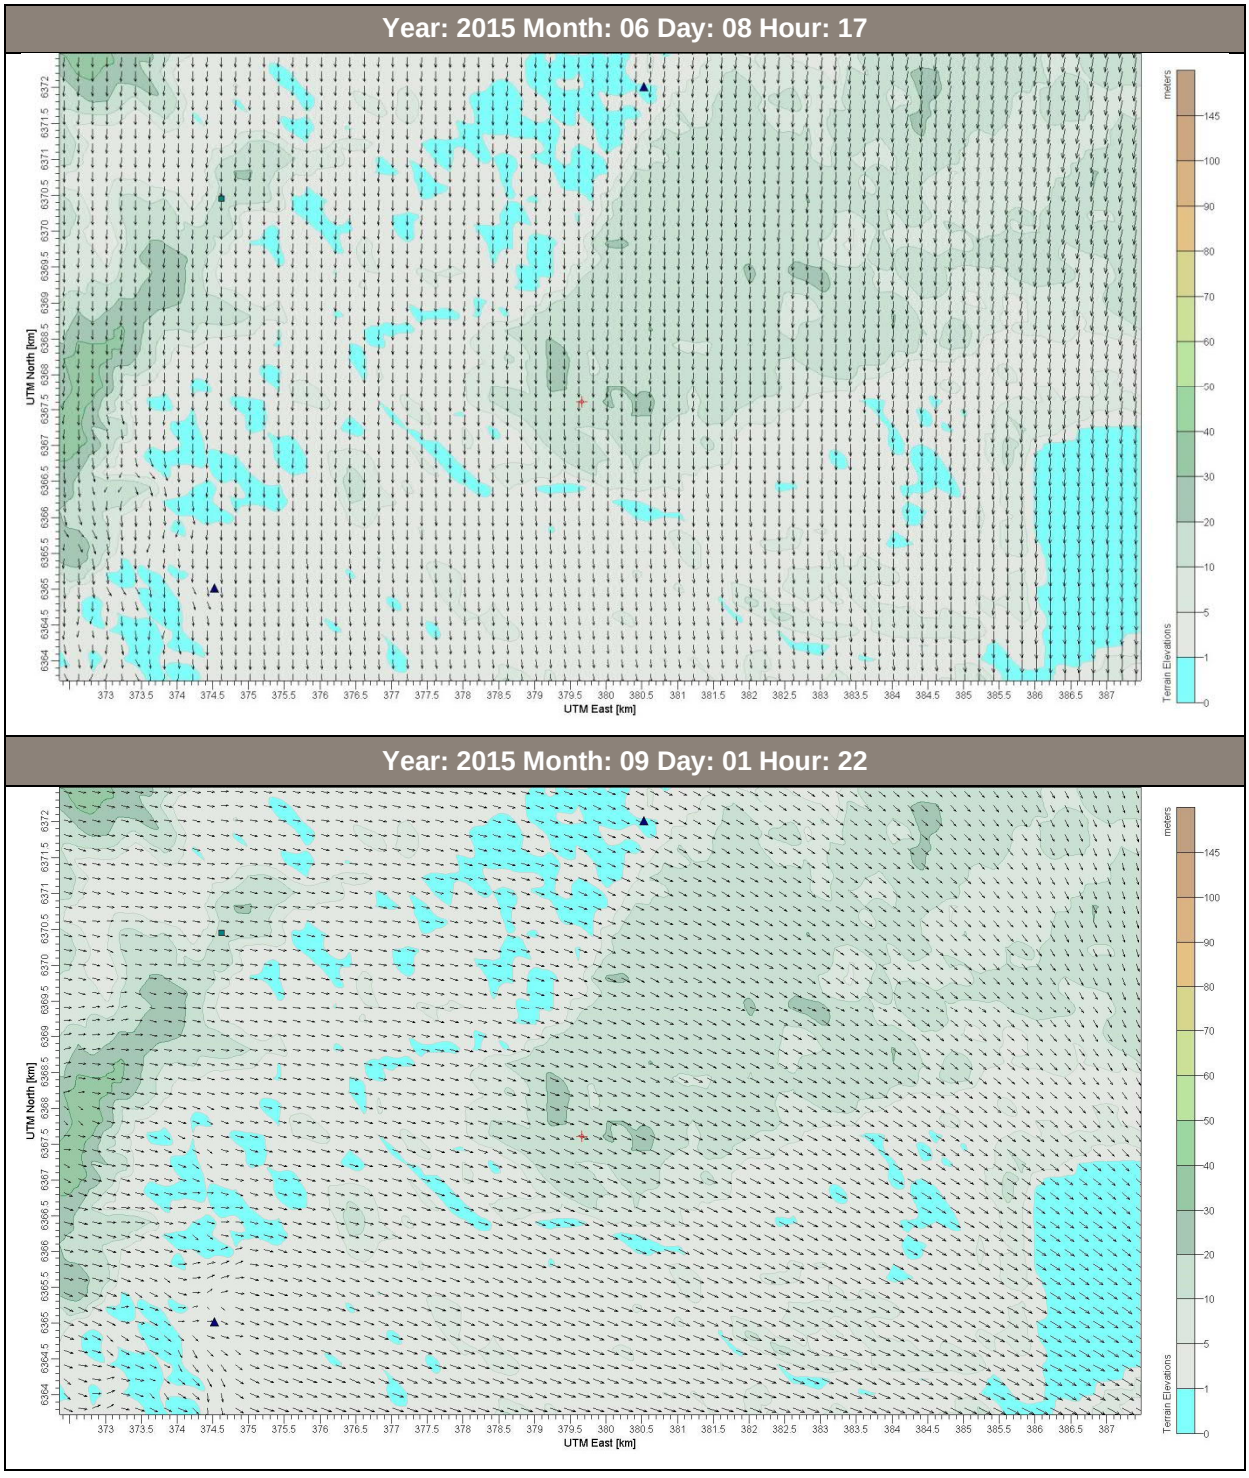

## Temperature

Temperature data is estimated within the CALMET program for each hour of the meteorological data set. A comparison of the temperature data between the OEH Beresfield and the CALMET Regain predicted temperatures for the assessed 12 month period is shown in **Figure 12**. A comparison of the temperature vs. hour of day for CALMET Regain is presented in **Figure 13.** The results are consistent with expected patterns for the Hunter region.

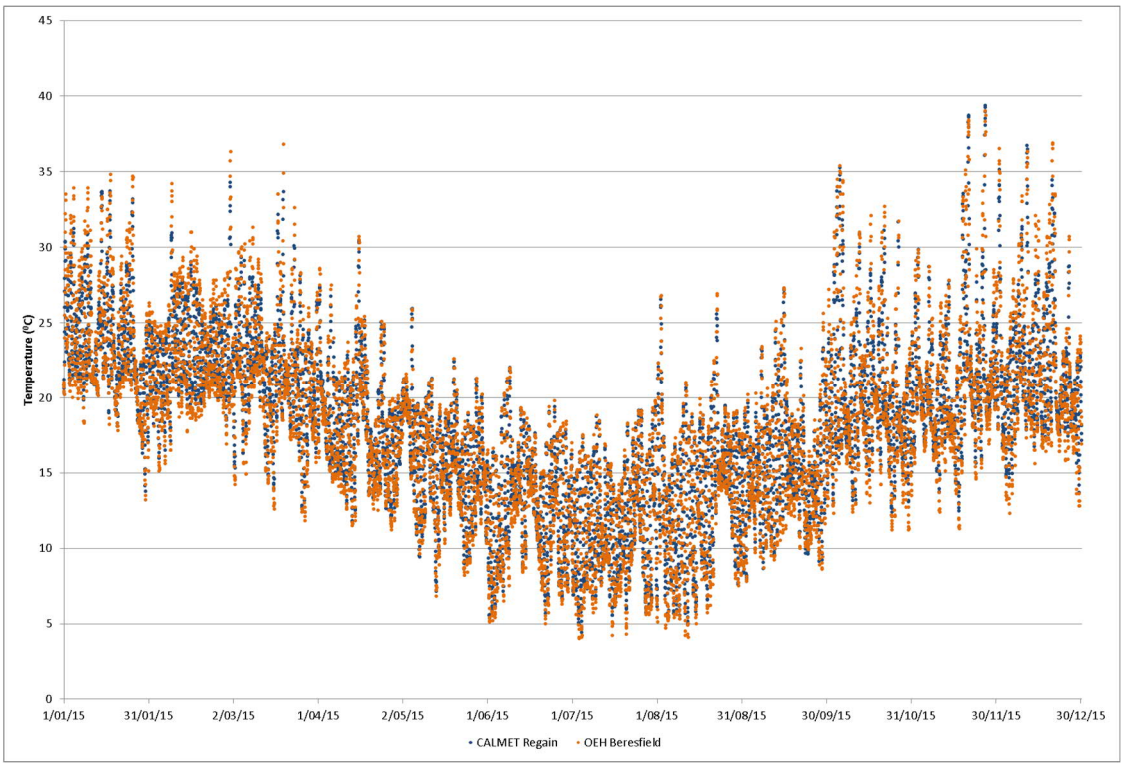

**Figure 12 Temperature data for the CALMET Regain and OEH Beresfield 2015**

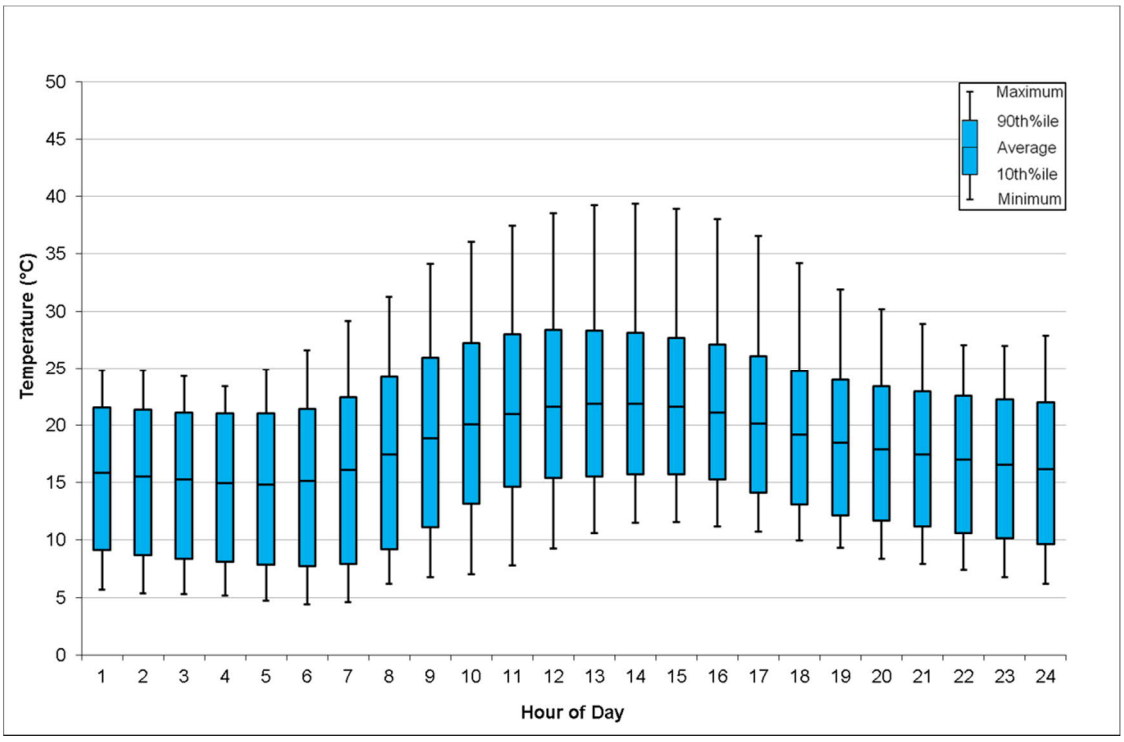

**Figure 13 Box & Whisker plot of Temperature data for the CALMET Regain 2015**

## Mixing Height

Mixing height is estimated within CALMET for stable and convective conditions (respectively), with a minimum mixing height of 50 m. **Figure 14** presents mixing height statistics by hour of day across the meteorological dataset, as generated by CALMET at Regain. These results are consistent with general atmospheric processes that show increased vertical mixing with the progression of the day, as well as lower mixing heights during night time. In addition, peak mixing heights are consistent with typical ranges.

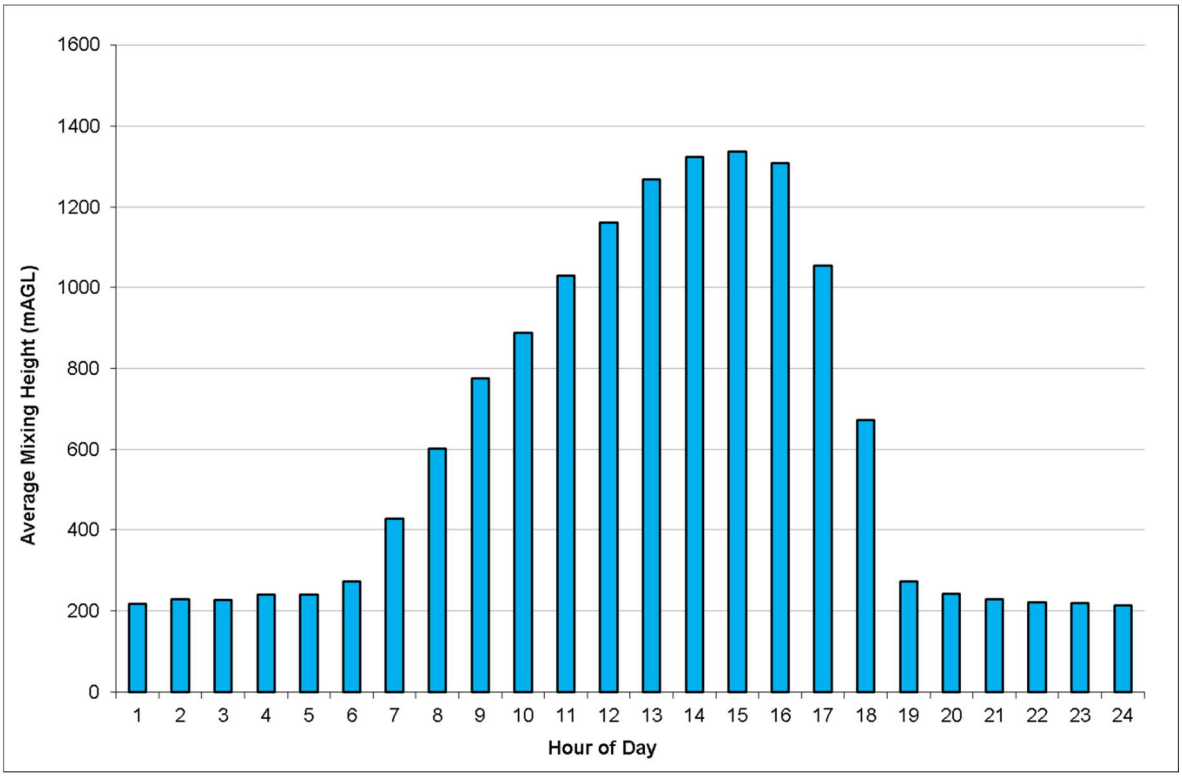

**Figure 14 Mixing Height Statistics by Hour of Day for CALMET Regain 2015**

## Atmospheric Stability

Stability class is used as an indicator of atmospheric turbulence for use in meteorological models. The class of atmospheric stability generally used in these types of assessments is based on the Pasquill-Gifford-Turner (PG) scheme where six categories are used (A to F) which represent atmospheric stability from extremely unstable to moderately stable conditions respectively. The stability class of the atmosphere is based on three main characteristics, these being:

- Static stability (vertical temperature profile/structure)
- Convective turbulence (caused by radiative heating of the ground)
- Mechanical turbulence (caused by surface roughness).

Whilst CALPUFF centrally uses Monin-Obukhov (MO) similarity theory to characterise the stability of the surface layer, conversions are made within the model to calculate the PG class based on Golders method (Golder 1972[6]) as a function of both MO length and surface roughness height. The PG Stability class frequencies for the CALMET Regain data are provided in **Table 37**.

[6] Golder, D. 1972, "Relations among stability parameters in the surface layer", Boundary Layer Meteorology, 3, 47-58

**Table 37 Stability Class Frequency for CALMET Regain 2015**

| Stability Class | Frequency CALMET Regain |
|---|---|
| A (Extremely Unstable) | 2% |
| B (Moderately Unstable) | 15% |
| C (Slightly Unstable) | 21% |
| D (Neutral) | 14% |
| E (Slightly Stable) | 6% |
| F (Moderately Stable) | 42% |

**Figure 15** and **Table 38** present an analysis of stability class frequency against wind speed at CALMET Regain and confirm a typical distribution.

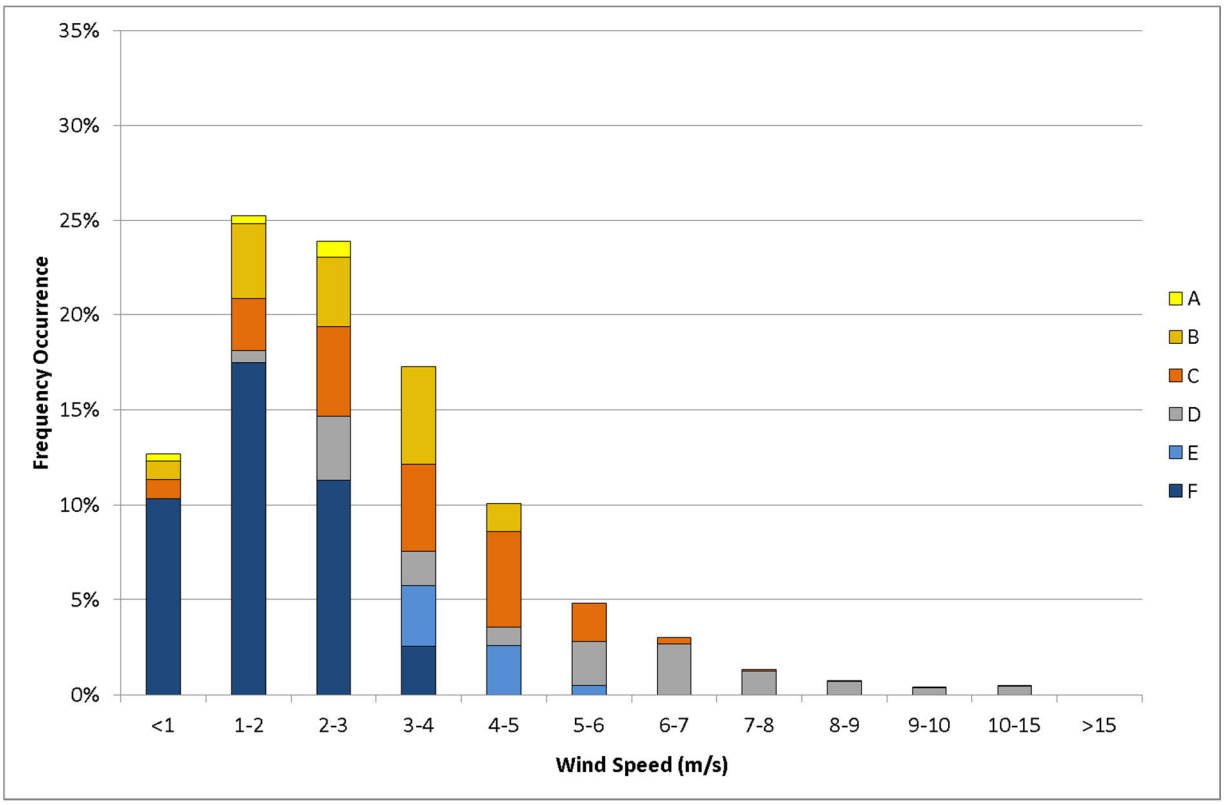

**Figure 15 Stability Class Frequency by Wind Speed CALMET Regain 2015**

**Table 38 Stability Class Frequency by Wind Speed CALMET Regain 2015**

| Stability Class | Frequency by Wind Speed (m/s) | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | <1 | 1-2 | 2-3 | 3-4 | 4-5 | 5-6 | 6-7 | 7-8 | 8-9 | 9-10 | 10-15 | >15 | All |

**Figure 16** presents an analysis of stability class at CALMET Regain by hour of the day and confirms a typical distribution.

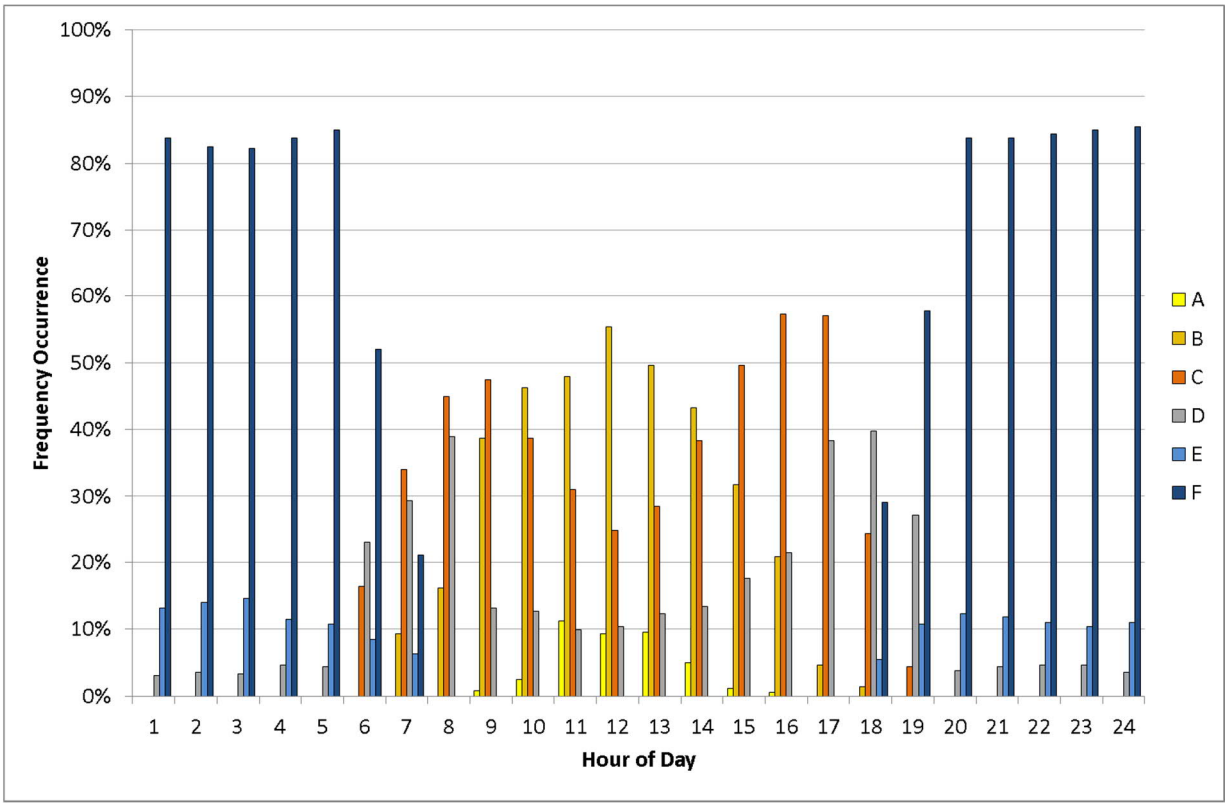

**Figure 16 Stability Class by Hour of Day CALMET Regain 2015**

## Conclusion

A 12 month meteorological dataset has been prepared for the Regain facility using a combination of local observations and prognostic modelling. Data has been evaluated using hourly observation data. The findings of the data analysis show that the CALMET model is performing well. The predicted meteorology is considered to be fit for purpose and acceptable for use in modelling of emissions from the Regain site.

# EXECUTIVE SUMMARY

## Introduction and Scope

The Tomago Aluminium Company (TAC) operates the aluminium smelter at Tomago, NSW. Pots are used at the facility in which the aluminium oxide is smelted to produce the aluminium. The pots are lined with an insulating material that is replaced from time to time. The removed potlining (spent potlining or SPL) is reprocessed to recover valuable minerals from the material. An SPL processing facility currently operates at the TAC site. TAC and Regain Services (Regain) propose to expand this plant to enable the reprocessing of stockpiled SPL and the ongoing generation of SPL from the smelter and from other smelters in the Hunter Valley (e.g. Kurri Kurri).

An Environmental Assessment (EA), incorporating a Preliminary Hazard Analysis (PHA), is required to support a Development Application (DA) as part of the SPL processing plant upgrade. Sinclair Knight Merz has been commissioned to prepare the PHA and report on the findings of the study for inclusion in the EA. The scope of work is to conduct a PHA in accordance with HIPAP No.6 to demonstrate that the facility is potentially hazardous and not hazardous in accordance with the SEPP 33 and land use safety planning requirements. The designation of a facility as hazardous or potentially hazardous relates to the risks posed to the surrounding community. A facility that exceeds the risk criteria published by the Department Planning (DoP) is designated as hazardous, a facility that is under the risk criteria published by DoP is designated as potentially hazardous.

## Methodology

The methodology selected for the study was that prescribed in the Department of Planning (DoP) Multi-Level Risk Assessment approach (Ref.3) for a level 2 analysis. This involved the semi-quantitative assessment of the hazards and risks associated with the operation of the upgraded SPL facility at the TAC site.

## Brief Description of the Proposed Facility

The site is located in an industrial area zoned 4a in the Port Stephens Council Local Environmental Plan. Pots will be brought to the SPL processing facility and the linings removed inside the delining building. The SPL will then be crushed, sized, ground and stored ready for processing. The prepared SPL will then be fed to a rotary kiln that would detoxify the SPL through a process of high temperature thermal oxidation. Once oxidised, the treated SPL would be passed to a water mixer for the controlled addition of water and the generation of potentially hazardous gases (primarily ammonia, hydrogen, methane and acetylene). The gases produced would be fed back into the kiln as fuel and thermally destroyed. Once the material has been process, it will be blended, dried and stored for ready for transport offsite.

The SPL processing and product storage facilities would be fully sealed, including covered conveyors and sealed atmospheric storage bins. Ductwork would be installed throughout the process plant system and connected to dust generating areas such as mills, crushers, conveyors, storage bins and the kiln/dryer. The dust extraction systems would maintain a negative pressure within the process system and buildings, preventing the escape of fugitive dust.

Dust would be collected via the baghouse dust collectors, which would be fitted with alarm systems to immediately shut down plant operations in the event of baghouse failure (i.e. bag failure and breakthrough). Visual and audible alarms would sound within the plant buildings and status indicated on the plant control system monitoring display. Collected particulate matter would be fed back through the production cycle.

The dust extraction systems would draw air from within each building at the roof ridgeline, and pass it through dust filter/baghouse facilities. The air discharge from each baghouse would be directed to atmosphere via stacks. The solid discharge from each baghouse would be collected and fed to the products blending hopper.

**Hazard Identification and Assessment**

A hazard identification table was developed (see **Appendix A**) to identify hazards and safeguards associated with the operation of the SPL facility. SPL contains a number of hazardous materials (mainly in minor quantities and trace elements) including sulphides, carbides, nitrides, fluorides and cyanides. Direct contact with these materials may result in irritation and health impacts to personnel involved with the storage and handling of the SPL. Mixing of untreated SPL with water may result in the generation of toxic and flammable gas. Hence, the hazard analysis has focused in the potential for personnel to contact of SPL materials and the ingress of water into storage areas. A summary of hazardous scenarios and proposed safeguards is discussed below.

- **Dust Generation in Buildings** – the generation of SPL dust occurs inside the buildings associated with the storage and handling of SPL. All buildings at the proposed upgraded facility will be fitted with dust control equipment, including baghouses for the control of dust prior to discharge of the extracted air stream to atmosphere via stacks. Baghouses will be fitted with differential pressure instruments to identify bag failures that will initiate plant operations shut down. All personnel working inside buildings will be located inside operating equipment cabins fitted with air conditioning to prevent contact between personnel and SPL. Appropriate PPE (respirators, helmets, gloves, etc.) will be worn by operators moving through the facility. Hence, it is considered that adequate protection is provided for personnel and potential SPL dust release beyond the site confines. Notwithstanding this, an effective

Safety Management System will be required to ensure equipment operates successfully at all times.

- **Rain & Water Leaks into the SPL Building(s)** – in the event of water contact with the SPL there is a potential for toxic and flammable gas generation. Water may leak into the building from holes in the roofing or walls. An analysis of the quantity of water required to generate hazardous quantities of gases revealed that a water requirement of over 680kg is required for hazardous levels of toxic gas generation and over 8 tonnes for flammable gas, above LEL. It would not be possible for this amount of water to enter the shed through small holes in the roof or walls. Hence, there is no potential for toxic/flammable gas generation from leaks in the roof or walls.
- **Carrying of Water into Sheds on Trucks** – Trucks entering the SPL sheds during rain periods could carry water into the sheds which could contact the stored SPL. This could lead to the generation of toxic/flammable gas. However, as noted above, it would require around 680kg of water to generate hazardous levels of toxic gas and over 8 tonnes of water to generate quantities of flammable gas such that an explosive mixture was present in the building. It would not be possible to carry these quantities of water into the building on trucks that were passing through rain. Hence, there is no potential for toxic/flammable gas generation from leaks in the roof or walls.

- **Kiln Failure –** in the event of a flame failure (i.e. flameout) gas may build up in the kiln and, if ignited, could result in explosion. However, the kiln burner is fitted with a flame detector that will immediately isolate gas supply, preventing potential gas build up in the kiln. In the event of temperature excursions, above or below the optimum operating range (750-800$^{o}$C), there is a potential for failure to destroy contaminants or to generate hydrogen fluoride (HF). To minimise this risk, the kiln is fitted with a number of redundant temperature probes that will be monitored by a computer control system. In the event of any loss of temperature control the kiln will be shut down and feed ceased. This will eliminate the potential for continued release of contaminants from the kiln.

- **Hydro-Mixer Failure** – the hydro mixer adds water to the treated SPL stream to react the carbides in the SPL. This produces ammonia/acetylene and methane gas, which is fed back to the kiln for burning. In the event of an induction (ID) fan failure, the gas could accumulate in the mixer, resulting in release and/or ignition/explosion in the mixer. However, in the event of ID fan failure, the kiln operation will be shut down and no further processing of SPL will occur. Any gas build up in the mixer will immediately burn as the mixer would be operating in a temperature range of about 500$^{o}$C, well above auto-ignition temperature of the gases (i.e. ignition without an ignition source). Further, as noted above, it would require many tonnes of water addition to generate gases that would mix with air resulting in an explosive mixture within the building. Once the mixer was shut down, this would not be possible as SPL feed would be

stopped, eliminating the gas generating source. Hence, the protection systems provided for this area of the plant are adequate to and the risk of gas release at hazardous quantities is negligible.

**Conclusions and Recommendations**

It is concluded that the hazards and risks associated with the operation of the proposed SPL plant upgrade are all adequately controlled by the existing and proposed safeguards at the plant. However, notwithstanding this, it will be necessary to ensure operating equipment is adequately inspected and tested on a regular basis. Hence, the following recommendations are made:

1. The management of the operations at the SPL facility will require the implementation of systems such as permit to work, equipment/electrical isolation, maintenance/operational procedures, etc. These are all elements of a Safety Management System (SMS). It is therefore recommended that an SMS be developed for the SPL plant to include elements of the operations, maintenance and management of the facility. The guidelines issued by the Department of Planning in Hazardous Industry Planning Advisory Paper No.9, “Guidelines for Safety Management Systems” (Ref.9) should be used in the development of SMS for the facility.

2. The calibration of temperature monitoring and control equipment in the kiln is critical in maintaining effective temperature control. It is therefore recommended that a kiln temperature monitoring and calibration procedure be developed and implemented to ensure the temperature control system is operated using correct data and information, this should also include periodic testing of the alarms throughout the plant. This procedure should be part of the plant Safety Management System.

3. It is critical that in the event of ID fan failure, the water supply to the SPL/Water mixer is isolated to prevent continued water addition and hazardous gas generation. It is therefore recommended that an interlock be fitted to the water supply system and ID fan such that in the event the ID fan stops for any reason, the water supply to the mixer is isolated.

# 1. INTRODUCTION

## 1.1 Background

The Tomago Aluminium Company (TAC) operates the aluminium smelter at Tomago, NSW. The plant processes alumina in pots using high electric current to produce aluminium. The pots are lined with an insulating material (pot lining) to protect the steel casing of the pot from the high aluminium smelting temperature. As part of the ongoing maintenance of the pots, the pot lining is regularly replaced and the spent materials (spent pot lining – SPL) are currently processed on site by Regain Services Pty Ltd (Regain), in an SPL processing facility in the western part of the site.

The SPL processing facility at the TAC site extracts the valuable minerals from the material. The current scale of reprocessing is 12,000 tonnes per annum. It is proposed to expand this plant to enable the reprocessing of stockpiled SPL and the ongoing generation of SPL from the smelter, and to process SPL from other smelters in the Hunter Valley (e.g. Kurri Kurri).

As part of the Development Application (DA) process, the local regulatory authority (Port Stephens Council) requires an Environmental Assessment (EA) to be prepared. A review of State Environmental Planning Policy (SEPP) No.33 (Ref.1), conducted for the EA, identified that it was necessary to conduct a Preliminary Hazard Analysis (PHA). Hence, Sinclair Knight Merz was commissioned to prepare the PHA and report on the findings of the study for inclusion in the EA.

This report details the PHA objectives, scope of work, methodology, results, conclusions and recommendations.

## 1.2 Objectives

The objectives of the study are to:

- Prepare a Preliminary Hazard Analysis (PHA) for the proposed Regain SPL Processing facility expansion, at the Tomago Aluminium Smelter, in accordance with Hazardous Industry Planning Advisory Paper (HIPAP) No.6 – Hazard Analysis Guidelines (Ref.2); and
- provide a report on the results of the PHA study for inclusion in the EA.

## 1.3 Scope of Work

The scope of work is to conduct a PHA in accordance with HIPAP No.6 to demonstrate that the facility is potentially hazardous and not hazardous in accordance with the SEPP 33 and land use safety planning requirements. Noting that facilities designated to be

hazardous are not permitted in certain land zonings, however, facilities designated to be potentially hazardous are permitted in a wider range of land zonings. The designation of a facility as hazardous or potentially hazardous relates to the risks posed to the surrounding community. A facility that exceeds the risk criteria published by the Department Planning (DoP) is designated as hazardous, a facility that is under the risk criteria published by DoP is designated as potentially hazardous.

The PHA study scope covers all plant and facilities associated with the Regain SPL treatment process only. It does not include any plant and facilities associated with other process upgrades at the TAC smelter.

# 2. METHODOLOGY

## 2.1 Approach

DoP Multi Level Risk Assessment (Ref.3) approach was used for the PHA study of the proposed SPL processing facility at the TAC smelter, Tomago. The approach considered the development in context of its location, the quantity and type (i.e. hazardous nature) of hazardous and dangerous goods stored and used in the process, and its technical and safety management control. The Multi Level Risk Assessment Guidelines are intended to assist industry, consultants and the consent authorities to carry out and evaluate risk assessments at an appropriate level for the facility being studied.

The Multi Level Risk Assessment approach is summarised in **Figure 2.1**. There are three levels of assessment, depending on the outcome of preliminary screening. These are:

- **Level 1** – **Qualitative Analysis**, primarily based on the hazard identification techniques and qualitative risk assessment of consequences, frequency and risk;
- **Level 2** – **Partially Quantitative Analysis**, using hazard identification and the focused quantification of key potential offsite risks; and
- **Level 3** – **Quantitative Risk Analysis (QRA)**, based on the full detailed quantification of risks, consistent with HIPAP No.6 (Ref.2).

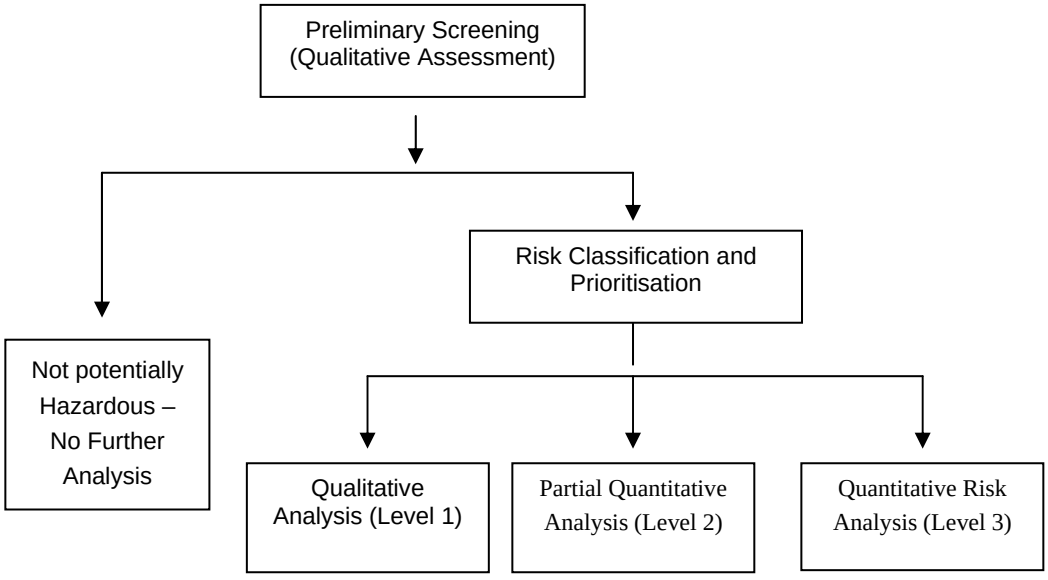

**FIGURE 2.1**
**THE MULTI LEVEL RISK ASSESSMENT APPROACH**

## 2.2 Selected Level of Study

The document "Applying SEPP 33" (Ref.4) guideline may also be used to assist in the selection of the appropriate level of assessment. This guideline states the following:

*"It is considered that a qualitative PHA may be sufficient in the following circumstances:*

- *where materials are relatively non-hazardous (for example corrosive substances and some classes of flammables);*
- *where the quantity of materials used are relatively small;*
- *where the technical and management safeguards are self-evident and readily implemented; and*
- *where the surrounding land uses are relatively non-sensitive.*

*In these cases, it may be appropriate for a PHA to be relatively simple. Such a PHA should:*

- *identify the types and quantities of all dangerous goods to be stored and used;*
- *describe the storage/processing activities that will involve these materials;*
- *identify accident scenarios and hazardous incidents that could occur (in some cases, it would also be appropriate to include consequence distances for hazardous events);*
- *consider surrounding land uses (identify any nearby uses of particular sensitivity); and*
- *identify safeguards that can be adopted (including technical, operational and organisational), and assess their adequacy (having regards to the above matters).*

*A sound qualitative PHA which addresses the above matters could, for some proposals, provide the consent authority with sufficient information to form a judgement about the level of risk involved in a particular proposal*".

Based on the above details a qualitative analysis has been performed as the SPL material is relatively non-hazardous and the surrounding land uses are relatively non-sensitive. Further, the proposed location of the SPL storage is well clear of the site boundary, the closest boundary to the proposed SPL storage is over 320m to the west, and the adjacent facilities are industrial in nature. The closest residential property is the caravan park 1000m m to the west of the TAC property (from the property boundary) and over 1,300m from the SPL facility.

## 2.3 Detailed Analysis Methodology

The detailed qualitative methodology was conducted as follows:

- **Hazard Identification Table** – a hazard identification table was developed to determine those hazards with the potential to impact offsite. The hazard identification table was also developed to determine the proposed safeguards associated with the facility and their effectiveness in managing the hazard.
- **Detailed Hazard Analysis** – each identified hazard was selected and assessed to determine the hazard consequence and frequency. In some cases, a numerical

consequence was developed to assist the determination of impact distance and offsite hazard severity (if any).

- **Risk Assessment** – as part of the hazard analysis, the combination of consequence and frequency was performed to assess the risk. Comments were made on each risk and the potential for impact to offsite land uses.
- **Conclusions and Recommendations** – conclusions were made for each assessed hazard and where required recommendations for risk reduction included in the report.

# 3. BRIEF DESCRIPTION OF THE PROPOSED SPL FACILITY

## 3.1 Land Zoning and Adjacent Facilities

The proposed SPL will be located within the boundary of the existing TAC smelter facility. The smelter lies within the Port Stephens local council precinct and is located in land currently zone 4a Industrial (General A). Under the current Port Stephens Local Environmental Plan (LEP), the smelter is permitted in this land zoning.

A scoping report was prepared by HAL Environsciences in September 2006 (Ref.10). This document has been used as the basis for the process description in this document. **Figure 3.1** shows the regional location of the site and **Figure 3.2** shows the proposed location of the SPL processing plant in relation to the TAC site layout and adjacent facilities. The TAC smelter is located north of the Hunter River and on the northern side of Tomago Road. The closest residential area is the caravan park is located on Tomago Road, adjacent to the Pacific Highway. The caravan park is located about 1300m from the TAC site boundary. The closest residence is located to the east, about 1700m from the proposed SPL building.

- **Facilities to the East** - The property to the east is currently an industrial estate occupied by various small industries associated with metal fabrication, welding and construction (located about 1100m from the SPL facility).
- **Facilities to the South** – Austchem is located adjacent to the TAC southern boundary (400m). The properties across Tomago Road, to the south, are mainly small industries, such as welding and metal fabrication works (550m). The Tomago Bowling Club is also located in this area (550m) as well as a periodic detention and correctional centre (800m).
- **Facilities to the West** - The property to the west is also an industrial estate. Properties directly west adjacent to the Tomago smelter site are Hunter Galvanisers (320m) and EIMCO Mining Equipment manufacturers (340m).
- **Facilities to the North** - The property to the north is currently occupied by the Newcastle Botanical Gardens (>2000m).

**TAC SITE LOCATION**

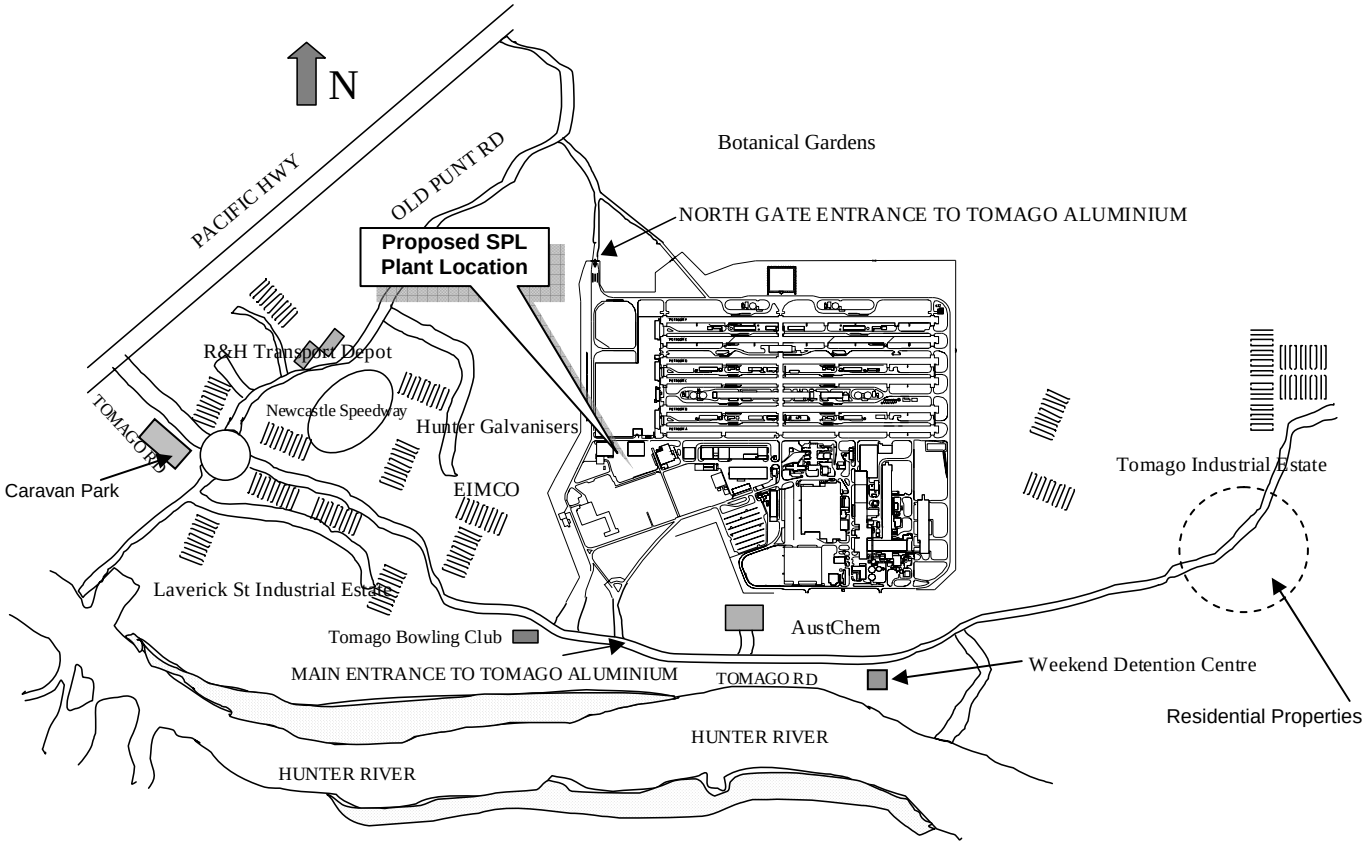

**FIGURE 3.2**
**TAC SITE LAYOUT AND ADJACENT FACILITIES**

## 3.2 Brief Description of the Aluminium Manufacturing Process

The aluminium smelting process involves the manufacture of carbon anodes for the reduction of alumina to aluminium and the casting of the molten alumina into metal ingots. The reduction of alumina to aluminium is performed in large electrolytic cells known as pots. These pots are lined with refractory materials and an inner carbon cathode shell.

Tomago Aluminium has three potlines, each containing 280 pots. Alumina is fed into the pots via a closed-system feed hopper that sits above the pot, and is dissolved in a bath of molten cryolite (sodium aluminium fluoride). Carbon anodes are used to introduce electricity into the pots to drive the reduction process. They are manufactured on site in the Carbon Plant from petroleum coke and liquid pitch, which are mixed together to form a paste and then compacted and shaped. The anodes are baked in one of two gas-fired baking furnaces for several weeks at temperatures of up to 1200$^{o}$C, and then fitted with rods and transported to the potlines. The baked carbon anodes are consumed in the aluminium smelting process.

The molten aluminium produced is siphoned off into a ladle using a vacuum system, and transported to the Cast House where it is poured into large holding furnaces. The composition of the metal is determined, and alloying elements such as silicon, manganese, magnesium, copper and zinc are added if required. The molten metal is then cast as small ingots, tee ingots, billets or slabs.

The pots used to reduce alumina are lined with carbon and refractory lining, which is collectively referred to as potlining. Potlining has a life cycle of six to seven years, over which time it becomes contaminated with materials such as alumina, aluminium, calcium, fluoride compounds and sodium. Cyanide compounds, aluminium nitride and aluminium carbide can also be created in the reducing atmosphere of the pots and infiltrate the potlining. The deteriorated potlining, known as Spent Potlining (SPL), is regularly replaced as part of the periodic individual rebuilding of the pots.

SPL is typically removed in two stages. First-cut SPL is the removed carbon cathode lining, whilst second-cut SPL is the removed refractory lining. SPL materials are currently stored on the Tomago Aluminium site, and were shipped internationally for processing prior to the commissioning of the demonstration plant. The composition of the SPL material is highly variable. Contaminants that impregnate the SPL come from the dross materials, which can contain up to 10 % aluminium and sodium nitrides and carbides. The contamination in the SPL is created through the diffusion of dross into the carbon lining and chemical reactions occurring in the pot. Testing has indicated that there is some nitride and carbide content in the SPL, but this is indeterminate as the content will vary from pot to pot. Hence, a conservative estimate of 1% nitride/carbide contamination has been made, based on the testing performed for the material.

The majority of the SPL consists of non-activated carbon (10 – 70%), aluminium oxide (10 – 30 %), and aluminium (10 – 30 %). The fluxing properties and calorific value of the SPL are inherently useful to the cement manufacturing sector. Therefore, the reprocessing of the SPL creates valuable products as well as reducing the waste disposal issues for the aluminium smelter.

## 3.3 Existing SPL Facility at the TAC Smelter

The SPL is classified as a Dangerous Good, is an Environmentally Hazardous Waste, and requires careful handling and disposal in accordance with regulatory requirements. SPL can no longer be disposed of in landfills, and the SPL waste from Tomago Aluminium has historically been shipped overseas for treatment. The SPL has been stored on site in a number of sheds prior to disposal. The sheds are located in the western part of the smelter site, close to the main switchyard. **Figure 3.2** shows the TAC site layout and the location of the existing SPL facility.

In 2002, a pilot/demonstration SPL processing facility was constructed at the smelter, adjacent to the storage sheds. Since commissioning, the demonstration plant has built up to its current processing capacity of 12,000 tonnes of SPL per annum. The demonstration plant has the capacity to treat the current SPL generation rates, yet cannot reduce the levels of SPL currently stored on site. Hence, it is necessary to increase the capacity of the existing plant to treat the stockpiled SPL at the site.

## 3.4 Brief Description of the Proposed SPL Facility

### 3.4.1 Overall Plant Description

The SPL processing plant and amenities would be located in two adjacent existing buildings that are currently used for the storage of the SPL, known as SPL Sheds 5 and 6 (see **Figure 3.3**). SPL Shed 5 is adjacent to the Deline facility, where the SPL is removed from the pots. Each building is 55 m long x 50 m wide (floor area of 2,750 $m^2$). The buildings are of steel frame construction with aluminium sheet metal walls and roof cladding. The building sides (north and south) are fitted with louver type ventilation panels. The floors are constructed from steel reinforced concrete. The steel retaining walls are sealed to the floor excluding the two doorways per building. Each doorway is fitted with a drainage system that is connected to leachate/liquid collection storage tanks.

The proposed plant will include the following components:

- **Materials Preparation** – including pot delining and SPL crushing, sizing, grinding and storage facilities;
- **SPL Treatment** – including a rotary kiln and water reaction mixer; and
- **Product Plant** – including blending, drying and final product crushing and storage facilities.

All of the materials preparation and storage facilities would be located within the SPL sheds, with the thermal treatment plant and the product blending and grinding facilities located between the two buildings. All externally-located plant would be enclosed. The proposed plant would have four air emission points – the SPL Shed 5 and Deline facility air filter (preparation facilities), the thermal treatment plant dust collector, the drying and blending plant dust collector, and the SPL Shed 6 air filter (product storage).

Plant associated with the existing demonstration plant, including conveyors, crushing, grinding and sizing equipment, raw material and product bins, etc., may be retained and utilised in the proposed project.

It is proposed to operate the plant 24 hours per day, 7 days per week.

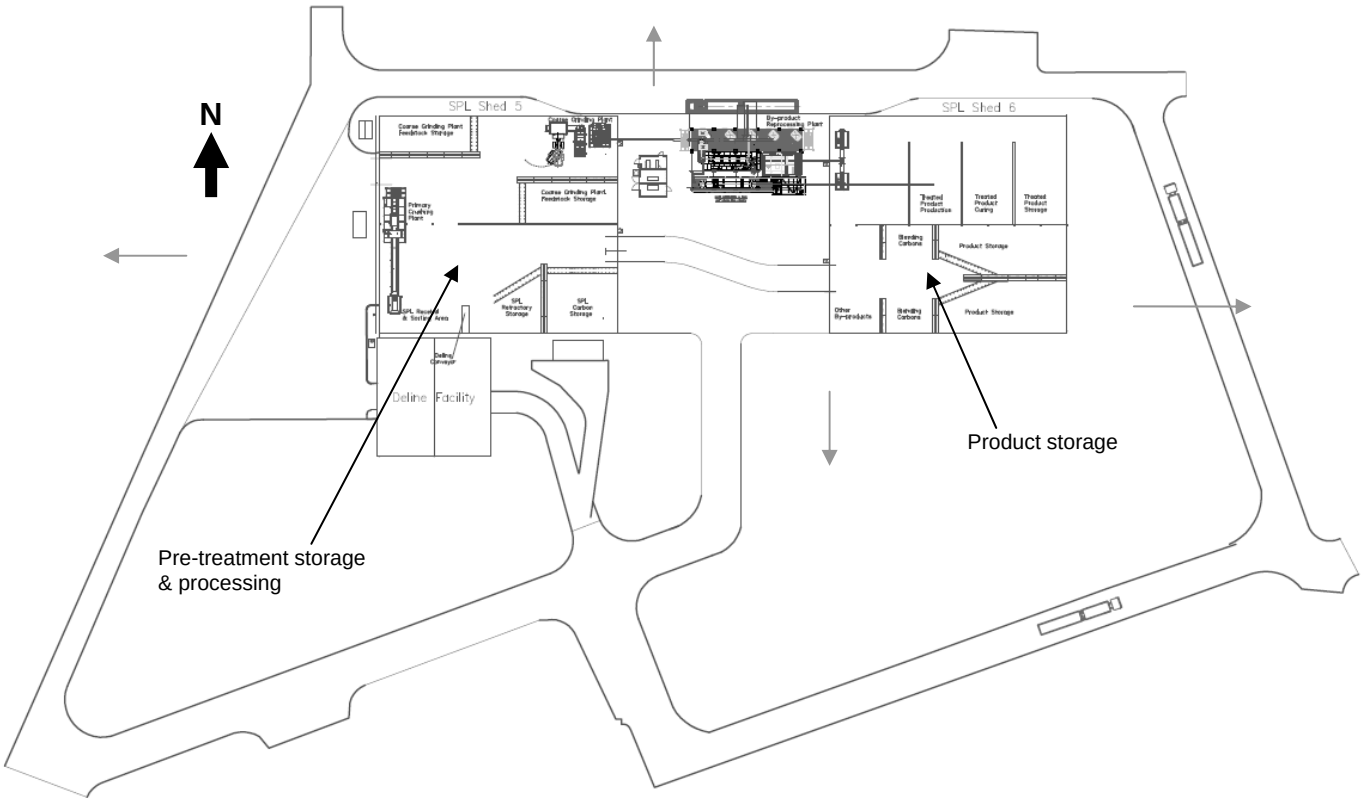

**FIGURE 3.3a**
**SPL PLANT LAYOUT**

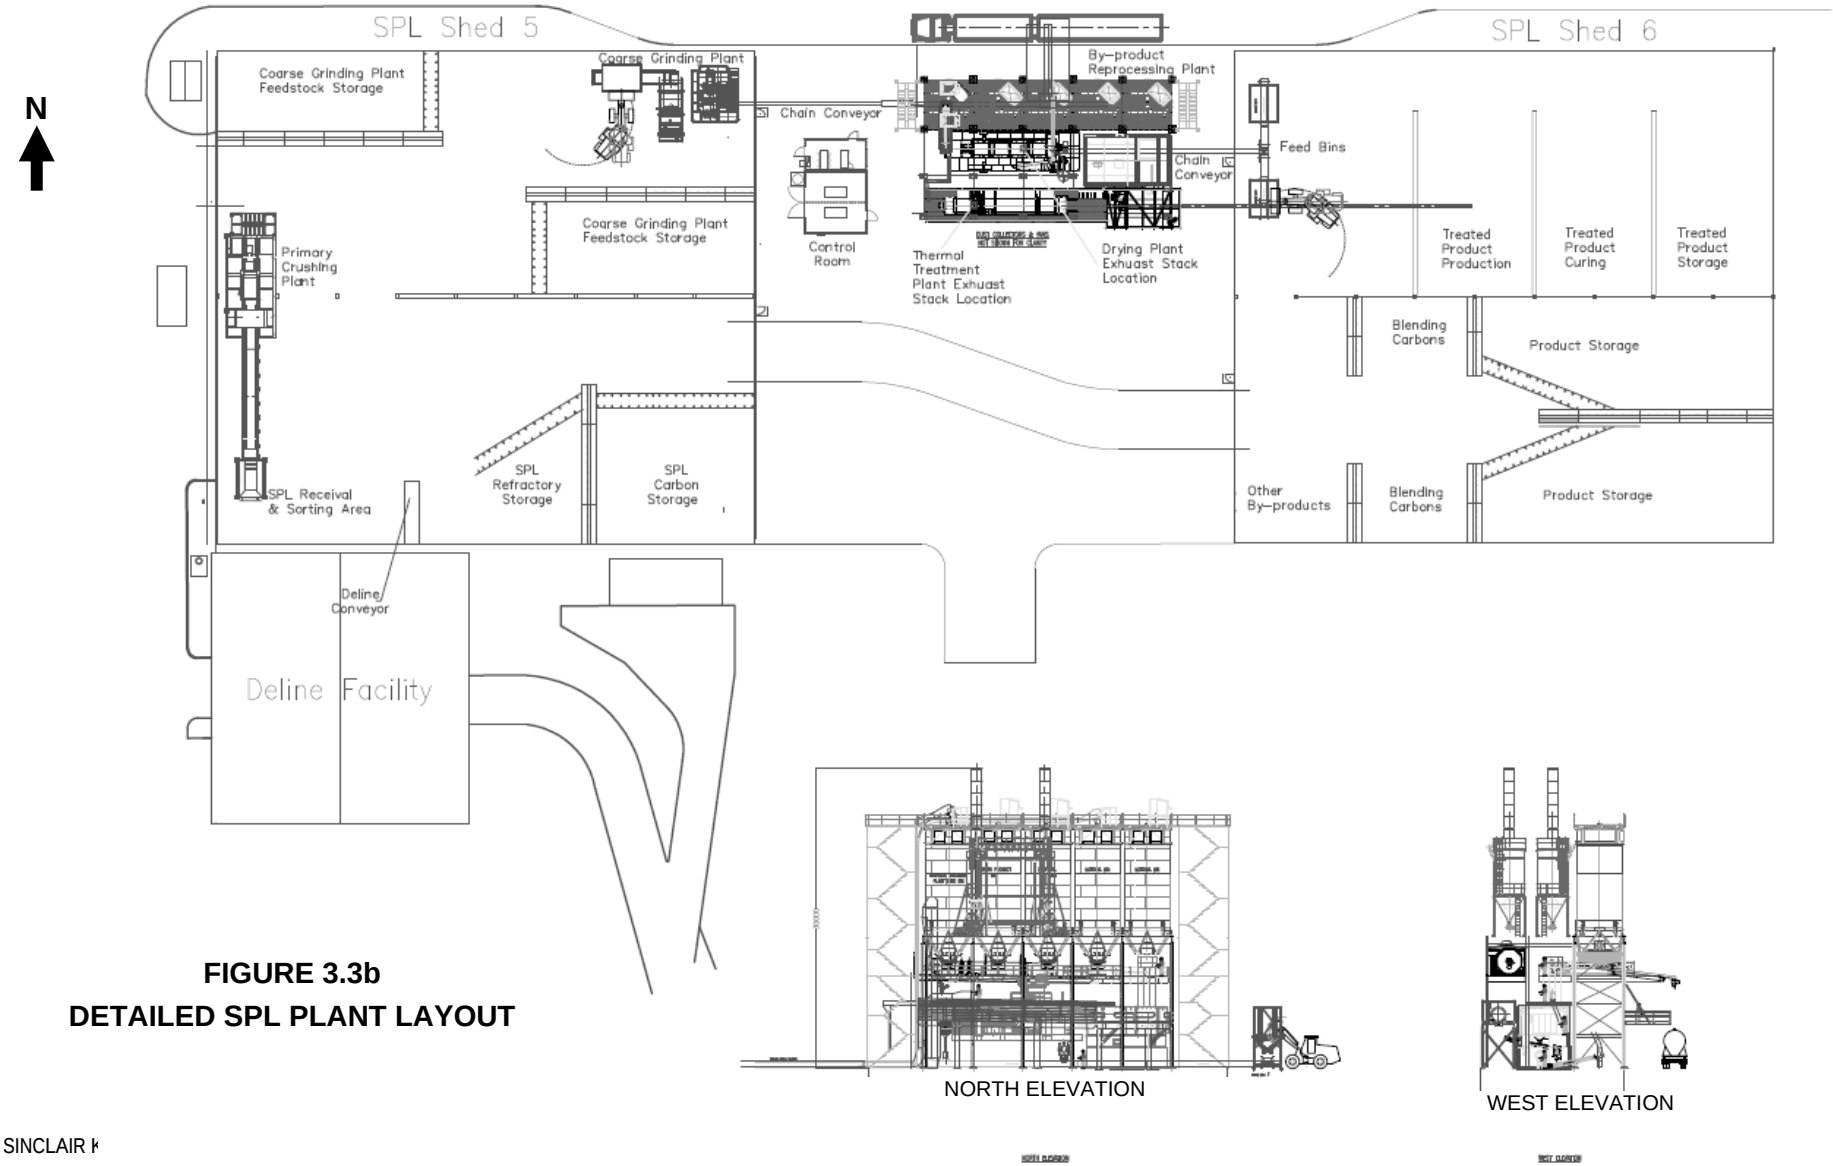

**FIGURE 3.3b**
**DETAILED SPL PLANT LAYOUT**

SINCLAIR K

### 3.4.2 SPL Treatment Process

The process developed by Regain to treat SPL material involves preparation of the SPL, heat treatment of the material combined with exposure to air and water, and grinding and blending of the treated material to form the mineral products. These stages are illustrated in **Figure 3.4**.

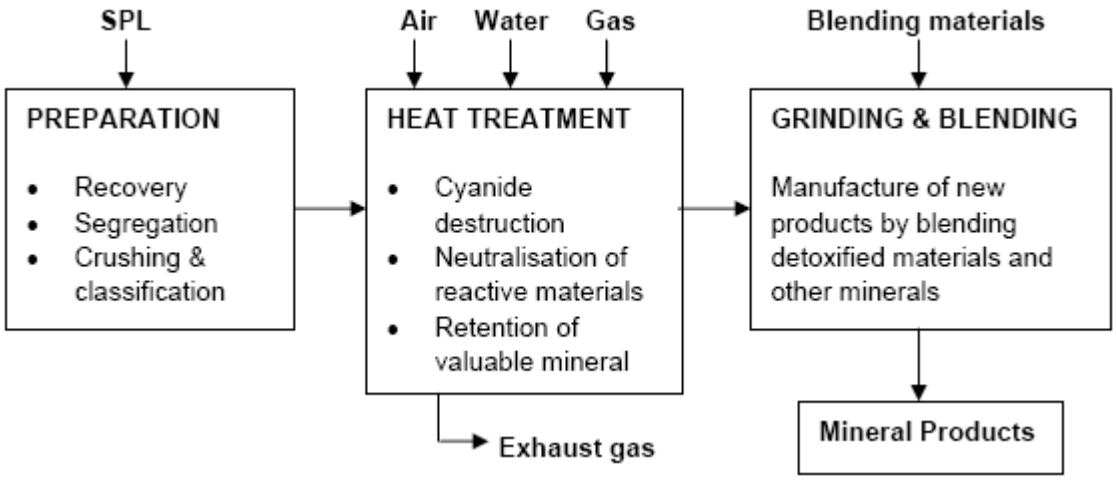

**Figure 3.4**
**TREATMENT PROCESS FLOW WORD DIAGRAM**

The treatment process destroys the cyanide and neutralises the flammable gas hazard associated with the SPL while retaining the valuable materials such as carbon, fluorides, and other inorganic compounds. Heating of the SPL material destroys most of the cyanide through the process of thermal oxidation, while the reactive compounds are neutralised by the water. Mineral products are made by blending the treated materials with minerals such as coal and sand and previously generated SPL treatment products to achieve the product specifications of the end users of the materials.

### 3.4.3 Materials Preparation

The pots, containing the potlining material, would be taken to the existing Delining facility for mechanical removal of the SPL, with the SPL material transferred to SPL Shed 5 by conveyor. The SPL material would be stored in SPL Shed 5 prior to and during preparation, and moved within the building by frontend loader.

The SPL would be fed to a feeder hopper that directs the SPL onto the sorting station feed conveyor. The sorting station would size the SPL through a number of screens and chutes and remove any large lumps, which would be mechanically broken up and re-fed to the plant. The sorted material would then be fed to the primary crusher, which would be

operated on a batch process campaign basis for three to four months per year. The primary crusher would be used to homogenise the material for feeding to the secondary crusher and sizing plant.

Once crushed, the SPL would be transferred to the feed stock storage bins in SPL Shed 5 via front end loader. Prepared feed material would then be transferred to the thermal treatment plant via screw conveyor. Crushed SPL would be recovered from the feed stockpile and fed to the grinding mill to ensure the material is appropriately sized for the thermal treatment process.

### 3.4.4 Rotary Kiln and Water Reaction Mixer

The ground SPL would be fed to the rotary kiln using a screw conveyor, located at the base of the kiln feed bin. The rotary kiln would detoxify the SPL through a process of high temperature thermal oxidation. The kiln would be fired by natural gas at temperatures of 750 – 800$^{o}$C (N.B. temperatures would be maintained below 850$^{o}$C to prevent the liberation of fluoride from the SPL). Air would be drawn into the kiln via an induction fan to facilitate combustion. Combustion products would pass to the baghouse prior to discharge to atmosphere, with collected particulate matter fed back into the product manufacturing plant.

Thermally-treated SPL would then be fed to the water reaction mixer to evolve flammable gases (primarily ammonia, hydrogen, methane and acetylene). The gases produced would be fed back into the kiln as fuel and thermally destroyed.

After passing through the water reaction mixer, the processed SPL would be non-hazardous and no longer classified as a waste material. The detoxified product would be fed to stockpiles in SPL Shed 6 via conveyor.

### 3.4.5 Product Plant

The product plant would be located between SPL Sheds 5 and 6. Final product preparation includes processes such as blending, drying and final product crushing to achieve the characteristics required by the cement industry. Blending would be performed manually using a blending hopper, with material fed via front-end loader.

Coal, sand, or other SPL treatment products may be added to the treated SPL, which would then be fed to a rotary dryer via a screw conveyor. Up to 5,000 tonnes of inert blending materials could be used in the production process to meet end-user specifications. The product would then be dried to extract the moisture added during the water reaction process. Air passing through the rotary dryer would be heated using natural gas.

The dried product would be then fed to a product feed bin (4.5 m in diameter and 12 m high) using a bucket elevator, and fed to the product mill (ball mill) where it would be milled to produce a product of homogenous size. Following milling, the product would be passed to the product bin via a dense phase conveyor.

### 3.4.6 Dust Extraction and Control

All externally-located plant would be enclosed and all emissions from the proposed project would occur via the four independent dust control and collection points listed below.

1 SPL Shed 5 and delining facility air filter (SPL preparation facilities);

2 Thermal treatment plant dust collector; and

3 Drying and blending plant dust collector;

The SPL processing and product storage facilities would be fully sealed, including covered conveyors and sealed atmospheric storage bins. Ductwork would be installed throughout the process plant system and connected to dust generating areas such as mills, crushers, conveyors, storage bins and the kiln/dryer. The dust extraction systems would maintain a negative pressure within the process system and dust control on buildings would prevent the escape of fugitive dust.

Dust from the process would be collected via the baghouse dust collectors, which would be fitted with alarm systems to immediately shut down plant operations in the event of baghouse failure (i.e. bag failure and breakthrough). Visual and audible alarms would sound within the plant buildings, with the alarm displaying on the plant control system monitoring display. Collected particulate matter would be fed back through the production cycle.

The dust control systems would manage fugitive emissions from product storage areas.

### 3.4.7 Product Transfer

Products would be transferred in powder or granular form, from the smelter to markets, using road transport (trucks). Bulk powder products would be transferred to the road tankers via a fully covered conveyor and through a transfer spout and delivery nozzle system. The nozzle would be connected to the truck tanks, and an air return pipe would be connected to the truck to facilitate the return of transport air to the product storage bin. The transfer system will be fully enclosed from the storage bin to the pneumatic tanker.

The truck filling cycle would be controlled by the truck driver, who would be in attendance during the whole transfer cycle. The filling spout would be fitted with a high level shut off system, which would shut down the feed when the truck is full. This system would be supplemented by regular driver checks throughout the filling cycle.

Bulk granular products would be loaded into road trucks. Trucks carrying bulk granular products would have covers fitted over loads before leaving the storage shed. Bagged products would be loaded onto road trucks using forklifts.

The quantity of treated SPL produced at the site will determine the number of transport vehicles required to deliver the treated SPL to markets. Regain has estimated that between 3 and 5 trucks per week will be required for transport of the materials from the site.

### 3.5 Safety Features Installed in the SPL Plant

The plant will be fitted with a number of safety features, installed to manage the potential hazards associated with the operation of the plant. These are summarised below.

- **Process Plant Located within a Building** – the processing of SPL has the potential to liberate dust, which may become airborne and be carried beyond the confines of the plant and site. The process plant will be located within a fully enclosed building with roller shutter doors that can be opened and closed, as required, to manage the potential dust escape from the storage and processing area.

- **Building Dust Extraction System** – the operation of loading SPL to the process circuit has the potential to liberate dust into the atmosphere within the building. This dust has the potential to escape from vents and doors that may be open from time to time. The building will be fitted with a dust extraction system that will maintain a slightly negative pressure within the building, ensuring air is always drawn into the building through any openings (e.g. ventilation louvers, roller doors, etc.).

- **Building Dust Extraction Alarm & Shut Down** – the building dust extraction system will be fitted with a failure alarm (bag breakthrough and high dP) and plant shut down feature. In the event the building dust extraction fails, the operating plant will be shut down, along with plant SPL loading.

- **Fully Enclosed Process Plant Design** – the process plant will be designed to be fully enclosed, maintaining any generated dust within the confines of the plant and equipment. All conveyors, crushers and mills will be fully covered to prevent dust release.

- **Dust Extraction Fitted to Silos and Equipment** – a dust extraction system will be fitted to the plant and equipment to maintain a slightly negative pressure in the system. This will ensure no dust escapes from any minor openings (e.g. inspection ports).

- **Filter Bags Units for Dust Extraction** - each dust extractor will be fitted with a filter bag unit to remove the dust from the extracted air streams. Particulate concentrations within exhausted air from the dust extractors will be below permissible licence levels.

- **Filter Unit Alarms** – the filters bags are fitted with high and low pressure differential alarms. In the event of blocked bags, the pressure differential will rise due to bag blockage limiting flow through the bags. In the event a bag breaks(splits), pressure will reduce across the bags due to the hole. The changes in pressure are monitored and alarmed.

- **Bunded Materials Transfer Area** – the area where trucks are loaded and vehicles operate (i.e. transfer of SPL to and from the building) will be fully bunded to prevent potential SPL or product spills being released to nearby drains and stormwater run-off channels.

- **First Flush Pond** – the drains and stormwater channels outside the SPL bunded area are directed to the site first flush pond. This pond allows stormwater to be collected and assessed prior to release off-site.

- **Rotary Kiln** – the key process control for the rotary kiln is temperature control. The operational temperature of the kiln is between 750 and 800$^{o}$C. The temperature is controlled through the burner management system. The product temperature in the kiln is measured using thermo-couples connected to a digital control system. The desired heat range of the product is programmed into the control system. The burner management controls then maintain the required temperature. Independent (from controls) High/Low temperature monitoring and alarms are installed on the system.

- **Rotary Kiln** – the rotary kiln is fitted with four explosion doors or panels; two at the inlet end and two at the exhaust end. These are installed to ensure that in the unlikely event of explosion, the kiln is not destroyed but gases are safely vented to atmosphere.

- **Burner Management** – the plant is fitted with a burner management system that is designed in accordance with AS1853 (Ref.5). This standard requires burners to be fitted with isolation valves and flame detectors. In the event of a “flame-out” (i.e. the

flame fails to burn whilst the gas is still being fed to the burner), the flame detector is activated and the gas isolation valve closed.

- **Baghouse Temperature Monitoring** – temperature probes are installed in the baghouse to alarm and shut down the plant if the temperature in the thermal treatment plant dust exceeds 130$^{o}$C.

# 4. HAZARD IDENTIFICATION

## 4.1 Constituents of SPL

The SPL contains a number of materials in varying quantities. The extract from the material safety data sheet (MSDS - see **Appendix C**) lists a number of constituents of SPL. However, a data search has indicated that SPL can contain a number of additional materials not included in the MSDS presented at **Appendix C**. The additional materials may be present due to the types of fluxes used during the production of aluminium within the pot. A comprehensive list of potential constituents has been included below:

- Carbon, non-activated;
- Silica crystalline - quartz;
- Sodium hydroxide;
- Sodium fluoride;
- Sodium aluminium fluoride;
- Calcium fluoride;
- Calcium oxide;
- Aluminium oxide;
- Aluminium;
- Iron;
- Ferric oxide;
- Sulphur; and
- Free cyanide (trace amounts).

In addition to the materials listed above, the production of aluminium may result in the impregnation of the potlining with the following:

- Aluminium Carbide ($Al_4C_3$)
- Aluminium Nitride (AlN);
- Compounds of Fluoride (F);
- Compounds of Cyanide (CN); and
- Metals (Cu, Pb, As, Zn, Al).

## 4.2 Hazards Associated with SPL

The MSDS for SPL (**Appendix C**) lists the potential hazards associated with the storage and handling of SPL. It is noted that from the list of constituents in the first set of dot points (**Section 4.1**) that none of these materials are classified as a poison at the concentrations contained within the SPL and the material is not listed on the poisons schedule. However, the material may cause toxic reaction if swallowed. Whilst it is recognised that dust and particles may cause inflammation and irritation to mucous membranes, there is no significant poisonous reaction to humans listed in the MSDS.

However, for the second set of dot points (**Section 4.1**) there is a potential for acute toxic impact to human from cyanides, and chronic impact from fluorides. Whilst the aluminium carbide and nitride compounds are not immediately toxic, these materials (and compounds of fluoride) may produce the following toxic/flammable gases upon mixing with water:

- Aluminium Carbide ($Al_4C_3$) - Acetylene and Methane
- Aluminium Nitride (AlN) - Ammonia
- Compounds of Fluorides - Hydrogen Fluoride (not a likely gas as the material is alkaline and chemical reactions forming fluorides are suppressed in alkaline conditions)
- Hydrogen gas may also be released as a result of water/SPL mixing.

Hence, the safeguards at the plant must cater for the containment of dust and particulates and the prevention of uncontrolled mixing of water with the SPL product. A hazard table is presented at **Appendix A**. From this table a detailed hazard analysis has been prepared below.

## 4.3 Handling SPL Inside the Storage Buildings (transfer within the building, blending, loading hoppers, etc.)

Front end loaders (FELs) will be used to transfer SPL from the delining facility to the conveyors feeding the SPL to the storage area. FELs will also be used for blending and transfer of SPL from the storage bays into the feed hoppers for transfer to the rotary kiln. During the handling and transfer of SPL there is a potential to disturb the material and liberate dust. This will be similar to the delining operation, in that personnel within the building may be impacted by dust and any dust released may be carried off-site if it escapes the building.

It is noted that a number of safety systems will be installed to minimise the potential for dust to escape from the buildings to atmosphere, these are:

- the buildings will be fitted with a dust extraction system with a bag filter unit, that will extract the dust and discharge clean air to the atmosphere;
- in the event of significant bag failure, the differential pressure across the bag sets will fall, raising an alarm and notifying operators of the failure;
- bag blockage will also result in an alarm from high differential pressure (dP), that will shut down the dust extraction system (baghouse) and the SPL equipment until the dust extraction system is repaired and operational;
- personnel operating inside the SPL buildings (delining area and Shed 5) will not be working in the open space of the building where dust and other hazards (e.g. vehicles) are operating. Personnel will be working within sealed cabins of equipment, such as front end loaders (the cabins will be fully air-conditioned with sealed doors);
- personnel who must access the building area from time to time will be issued with a disposable respirator mask that will minimise the potential for dust to be inhaled during the short period they are in the building; and
- where extended maintenance is required on components and equipment, plant will be shut down to eliminate the potential for maintenance personnel to be impacted by dust generating equipment.

The management of the operations discussed above will require the implementation of systems such as permit to work, equipment/electrical isolation, maintenance/operational procedures, etc. These are all elements of a Safety Management System (SMS). **It is therefore recommended that an SMS be developed for the SPL plant to include elements to the operations, maintenance and management of the facility. The SMS should be developed using the principles detailed in HIPAP No.9 (Ref.9).**

The introduction and use of an effective SMS, in conjunction with the proposed safety features on the SPL plant will minimise the risk of impact to personnel in the SPL plant and release of SPL dust beyond the confines of the facility.

### 4.4 Rain & Water Leaks into the SPL Building(s)

The SPL buildings are constructed from steel frames with sheet metal covering. Minor nail holes and leak points may allow water to enter the building where SPL is stored (i.e. Shed 5 only), which may contact the stored SPL. Water when in contact with SPL may generate flammable (acetylene/methane) and toxic (ammonia) gases. However, as shown in **Appendix B**, considerable quantities of water (many hundreds of kilograms for toxic gas generation and many tonnes for flammable gas generation) would be required. Drips and leaks from nail holes and other leak points would not permit hundreds of kilograms or

tonnes of water into the building. The risk of rain water leaks resulting in hazardous gas generation is negligible.

### 4.5 Rain Water Carried into the SPL Building by Trucks

As noted in **Section 4.4**, mixing of water and SPL could result in the generation of flammable and toxic gases. **Appendix B** details the calculations for water SPL mix and the generation of toxic and flammable gases. **Table 4.1** summarises the calculation for a mix of 1kg of water with SPL. However, it is noted that mixing of water and SPL will never be homogenous and various factors, such as exothermic reactions, will reduce the available water and limit the quantity of gas release, hence, the results shown in **Table 4.1** are conservative.

**TABLE 4.1**
**SUMMARY OF GAS RELEASE QUANTITIES FROM 1kg WATER MIXING WITH SPL**

| Material | Release Quantity |
|---|---|
| Ammonia | 0.315kg |
| Acetylene | 1.4kg |
| Methane | 0.44kg |

Acetylene and methane are produced from aluminium carbide in the SPL. It has been assumed (conservatively) that the SPL produced in the Tomago smelter has, on average about 0.1% aluminium carbide content (as a result of contaminants impregnating the SPL). Aluminium carbide comes in two forms, $Al_2C_6$ and $Al_4C_3$ (Ref.6). When mixed with water, the former produces acetylene, the latter methane. Assuming that these two forms of carbide are available in equal quantities, then each of these carbides is found in 0.05% of the SPL.

The apportioning of water available for mixing with the various components of the SPL is assumed to be (based on the assumption of 1% nitride and 0.1% carbide in SPL):

Total: 0.1% carbide + 1% nitride = 1.1% nitride carbide mix.

Fraction of water available to mix with nitride = 1/1.1 = 0.91

Fraction of water available to mix with Carbide = 0.1/1.1 x 1 = 0.09 (= 0.045 for each carbide type)

Water lost to heat and exothermic reaction = 0.25 (estimate)

**Table 4.2** presents the modified quantities based on the available water:

**TABLE 4.2**
**SUMMARY OF GAS RELEASE QUANTITIES FROM 1KG WATER MIXING WITH SPL INCORPORATING HEAT LOSS AND FRACTIONS OF WATER COMPONENT MIX**

| Material | Proportion Remaining after loss to Heat | Proportion for each material | Initial Release Quantity | Final Release Quantity |
|---|---|---|---|---|
| Ammonia | 0.75 | 0.91 | 0.315kg | 0.215kg |
| Acetylene | 0.75 | 0.045 | 1.4kg | 0.047kg |
| Methane | 0.75 | 0.045 | 0.44kg | 0.015kg |

Notwithstanding the analysis above, all SPL processing will be performed within the SPL handling area (inside the building) preventing contact between rainwater and SPL. Vehicles that may enter the building may carry minor amounts of water into the storage area as a result of dripping water from trucks and equipment entering the building. This will not result in sufficient toxic or flammable gas release to be a hazard. This is demonstrated in the analysis conducted in **Appendix B**, a summary of which is presented at **Table 4.3**. This table shows that to reach flammable gas lower explosive limits (LEL)*or $LC_{50}$# significant quantities of water will be required (e.g. 802kg to 36.7 tonnes). Quantities of this magnitude will not be carried into the SPL storage buildings in truck tyres and bodies nor leak into the building from roof anomalies (holes).

**TABLE 4.3**
**SUMMARY OF LEVELS OF WATER REQUIREMENTS TO GENERATE HAZARDOUS QUANTITIES OF FLAMMABLE & TOXIC GASES**

| Flammable/Toxic Gas Generated | LEL or $L_{C50}$ (in the bld) | Quantity of gas Generated | Quantity of Water Required |
|---|---|---|---|
| Ammonia ($NH_3$) | 11,500ppm | 227.5kg | 802kg |
| Acetylene ($C_6H_6$) | 2.3% | 568.9kg | 7.9 tonnes |
| Methane ($CH_4$) | 5% | 807.4kg | 36.7 tonnes |

Hence, if these levels are not reached at the plant, dispersion of such releases downwind will result in reduced concentrations at the site boundary (closest boundary over 300m), Hence, there will be no impact offsite as a result of the postulated incidents of SPL mixing with water at the site.

## 4.6 Dust Emissions from Operating Equipment

The SPL is loaded to processing equipment, which is used to convey, crush and grind the SPL as part of the processing operation. The crushing and conveying actions have the potential to liberate dust which may escape from the equipment into the SPL buildings and

subsequently beyond the building confines. However, all equipment used for processing and storing SPL is covered and sealed, which prevents release of dust from within the equipment itself. In addition, all operating equipment in the SPL processing system is connected to a dust extraction system and baghouse, which maintains a slightly negative pressure inside the equipment preventing dust escape. In the unlikely event of dust extraction system failure, any minor quantities of dust that escapes the process equipment, located inside the SPL buildings, will be captured by the building dust extraction system, providing an additional safety feature.

The dust extraction system attached to the process plant has a number of safety features incorporated into the design and operation of the system, these include:

- Failure detectors for the dust extraction equipment (e.g. fan failure vacuum failure);
- Bag failure detectors (high and low differential pressure across the bags);
- Failure alarms on the dust extraction equipment; and
- Stopping process operations in the event of dust extraction system shut down.

The risk of dust release as a result of leaks from process equipment is minimal.

## 4.7 Rotary Kiln

### 4.7.1 Natural Gas Build Up in Kiln - Explosion

The rotary kiln is heated using a gas flame, which is fed by natural gas through a burner system installed on the end of the kiln. The burner is managed by a control system, which is designed and operated in accordance with AS1853 (Ref.5). The burner management system has a number of safety features installed including:

- Flame out detection;
- Gas isolation valves (auto-manual); and
- Temperature monitoring of the kiln space.

In the event of a flame out in the kiln there is a potential for the gas to accumulate within the system, ignite and explode. However, as the burner management system is fitted with a flame out detector, the gas will be immediately isolated preventing the potential for gas build up and explosion. Further to this safety system, the kiln is fitted with an induction fan, which draws gases from the kiln combustion space and discharges them via a stack to atmosphere.

As an additional safety feature the kiln has been designed with blast panels to minimise the potential for explosion damage to the kiln shell, in the unlikely event of an explosion in the kiln combustion space. An explosion in the kiln will result in panel activation and discharge of the products of combustion (explosion) from the ends of the kiln. There will be no impact offsite as a result of this incident.

### 4.7.2 Low Kiln Operating Temperature

In the event of restricted or reduced fuel gas flow to the kiln there is a potential for reduced operating temperature. In this event temperatures below 750$^{o}$C will fail to destroy the contaminants in the SPL. Hence, temperature control in the furnace is critical in maintaining treated SPL quality.

To minimise the potential for low temperature operation, the kiln will be fitted with a temperature control system. Thermocouples will be installed in the kiln shell that will monitor the kiln space temperature and control gas flow and combustion rates to maintain temperature between 750$^{o}$C and 800$^{o}$C. In the event of a plant excursion lower than 750$^{o}$C, thermocouples connected to plant controls will raise an alarm in the plant control room, both visual and audible. Operators will then be able to assess the alarm and respond accordingly. The thermal mass of the system will prevent rapid fall in temperature and there will be adequate time for operator response once the alarm has sounded.

The calibration of temperature equipment is obviously important in maintaining effective temperature control. **It is therefore recommended that a kiln temperature monitoring and calibration procedure be developed and implemented to ensure the temperature control system is operated using correct data and information, this should also include periodic testing of the alarms throughout the plant**. This procedure should be part of the plant Safety Management System.

The risk of failure to destroy all contaminants in the SPL is low due to the various thermocouples available, the alarm systems and the operator attendance at the plant during operational periods (i.e. plant is never left unattended).

### 4.7.3 High Kiln Operating Temperature

In the event of a high gas flow and elevated temperature in the kiln (in excess of 850$^{o}$C) there is a potential for hydrogen fluoride (HF) to be released in the kiln exhaust gases. Hence, temperature control in the furnace is critical to ensure that HF is not released in stack emissions.

Like the low operating temperature scenario, to minimise the potential for high temperature operation, the kiln will be fitted with a temperature control system.

Thermocouples will be installed in the kiln shell that will monitor the kiln space temperature and control gas flow and combustion rates to maintain temperature between 750$^{o}$C and 800$^{o}$C. In the event of a plant excursion higher than 800$^{o}$C, thermocouples connected to plant controls will raise an alarm in the plant control room, both visual and audible. Operators will then be able to assess the alarm and respond accordingly. The thermal mass of the kiln will prevent rapid temperature rises and, hence, once the alarm has sounded at 800$^{o}$C, there will be adequate time for operator response and shut down of gas supply, if required.

The risk of failure to destroy all contaminants in the SPL is low due to the various thermocouples available, the alarm systems and the operator attendance at the plant during operational periods (i.e. plant is never left unattended).

### 4.8 Hydro Mixer – Induction (ID) Fan Failure

The hydro mixer is used to inject water into the thermally-treated heated SPL. The aim of this operation is to react the thermally-treated SPL with water to remove the nitrides and carbides in the product so that the potential to generate uncontrolled flammable and toxic gases, from SPL/water mix, is eliminated. The hydro mixer provides this function in a controlled environment and then combusts the gases in the kiln. However, in the event of ID Fan failure, the exhaust gases from the burner are not extracted and the flammable and toxic gases, generated in the mixer, continue to be released. Hence, there is a potential for these gases to escape the mixer and be released into the building and subsequently beyond the building if sufficient gas generation occurs.

It is critical that in the event of ID fan failure, the water supply to the mixer is isolated to prevent continued water addition and hazardous gas generation. **It is therefore recommended that an interlock be fitted to the water supply system and ID fan such that in the event the ID fan stops for any reason, the water supply to the mixer is isolated.**

It is understood that as part of the burner management system, fuel gas supply to the kiln is isolated if the ID fan fails. Therefore the gases that are generated in the mixer may not be combusted in the kiln. In review of the possibility of gas release from the mixer and kiln itself, the hot kiln gases will, to some extent, create a natural draft through the exhaust system of the plant although the burner is shut down. The hot gases rising up the stack will create a slight vacuum in the base of the stack, which will draw gases from the kiln (and mixer) into the combustion space of the kiln. The natural draught will extract any gases generated in the mixer and pass them through the combustion space. It is noted that, although the gas supply is shut down and there is no flame in the kiln, the kiln temperature will still be in the order of 500$^{o}$C – 600$^{o}$C for some period after the ID fan failure. Temperatures in excess of 500$^{o}$C are well over the auto ignition temperature of

methane and acetylene, hence, these gases will be auto ignite and burn in the kiln space, which will in turn combust the ammonia.

In the event of ID fan failure, and gas release into the building, there is a potential for gas to accumulate in the building itself resulting in the formation of flammable and/or toxic gas clouds in specific areas of the building. The building is fitted with an extraction system, primarily for the removal of dust. However, the accumulation of flammable gas would be minimised by the extraction system and the development of a flammable cloud would be unlikely simultaneous with the failure of the ID fan. The building is also fitted with ventilation louvers along its side, providing further ventilation in the event of extraction fan failure simultaneous with ID fan failure.

Overall, the risk of flammable or toxic gas development in the kiln or building is low.

### 4.9 Loading of Treated SPL

The treated SPL will be loaded to road tankers using a conveyor and loading spout. The conveyor system will be fully covered and the spout will be fitted with a bellows unit to manage any dust that may be generated by the loading and to prevent rainwater contact with the loaded product. The conveyor systems and delivery spout will be connected to the dust extraction system and, hence, the risks of release from this system will be low (see **Section 3.4.7**). However, failure to connect the truck loading spout or spout failure itself could result in release of treated and blended SPL around the truck loading area. The driver will be present during all transfer activities and will be able to initiate emergency shut down of the transfer system in the event of a connection or spout failure. Further, there are only 3-5 transfers performed each week and these will be arranged so that trucks are not filled during rain periods.

It is also noted that the SPL is now treated and there are no hazardous compounds in the product that will cause hazardous gas generation or significant pollution concerns. The area in which the trucks are loaded will be contained by kerbs and gutters. Drains in the area will feed to the site collection ponds where sedimentation and water treatment occur before release off-site.

Notwithstanding the fact that there is little chance for hazard or pollution as a result of loading incidents, the tanker driver and plant operators will be in the vicinity of the loading operation at all times. Further, it is understood that the loadout area will be fitted with a closed circuit television camera (CCTV) which will enable personnel in the control room to monitor loadout during the full operation.

In summary the risk of hazardous impact from spout incidents is low.

# 5. CONCLUSIONS AND RECOMMENDATIONS

## 5.1 Conclusions

The analysis in **Section 4** reviewed a number of potential hazards that could result in the following incidents:

- Dust release from handling and process operations (e.g. front end loaders);
- Flammable and toxic gas release from water/SPL contact;
- Fluoride and other contaminants release as a result of kiln operational excursions;
- Flammable and toxic gas release as a result of equipment failure in the kiln/hydro mixer area; and
- Explosion in the kiln as a result of flameout.

Based on the analysis it is concluded that the risk of incidents at the site, that could result in offsite impact, is considered to be low due to the proposed safety features to be installed on the plant and the proposed operational and safety management of the facility.

Notwithstanding the proposed safeguards, associated with both hardware (equipment) and software (procedures), a number of recommendations were made during the analysis to ensure the facility is operated at the optimum level of safety.

## 5.2 Recommendations

Based on the analysis in **Section 4**, and to ensure the facility is operated at the optimum level of safety, the following recommendations are made.

1. The management of the operations at the SPL facility will require the implementation of systems such as permit to work, equipment/electrical isolation, maintenance /operational procedures, etc. These are all elements of a Safety Management System (SMS). It is therefore recommended that an SMS be developed for the SPL plant to include elements of the operations, maintenance and management of the facility. The guidelines issued by the Department of Planning in Hazardous Industry Planning Advisory Paper No.9, “Guidelines for Safety Management Systems” (Ref.9) should be used in the development of SMS for the facility.

2. The calibration of temperature monitoring and control equipment in the kiln is critical in maintaining effective temperature control. It is therefore recommended that a kiln temperature monitoring and calibration procedure be developed and implemented to ensure the temperature control system is operated using correct data and information. This procedure should be part of the plant Safety Management System.

3. It is critical that in the event of ID fan failure, the water supply to the SPL/Water mixer is isolated to prevent continued water addition and hazardous gas generation. It is therefore recommended that an interlock be fitted to the water supply system and ID fan such that in the event the ID fan stops for any reason, the water supply to the mixer is isolated.

# APPENDIX A

# HAZARD IDENTIFICATION TABLE

| Site Area or Operation | Cause | Consequence | Safeguard |
|---|---|---|---|
| SPL Handling – SPL Shed 5 | Tipping and moving SPL in the shed | - Dust generated during tipping and movements – potential dust release off-site<br>- Spill occurs beyond the immediate movement area – potential SPL spill into adjacent areas<br>- Personnel impacted by dust and spill (i.e. come into contact with SPL) – irritation and O&S problems | - SPL movement is performed within Shed 5 – spills and dust generation are contained within the shed<br>- Shed 6 is fitted with dust extraction equipment (i.e. baghouse) which prevents loss of dust beyond the immediate confines of the building<br>- Dust extraction equipment, fitted with a system of alarms so that equipment failure is notified via audible and visual alarms<br>- SPL handling is not permitted unless the dust extraction equipment is in operation (procedure)<br>- Personnel not involved with the plant operations are not permitted in the storage processing plant sheds<br>- SPL plant operations personnel are trained in the operation of the SPL processing equipment and procedures<br>- Visitors are not permitted on the plant without completing a plant induction procedure |
| SPL Handling – SPL Shed 5 | - Rain during the unloading operation<br>- Transfer equipment (trucks, FEL) is impacted by rain during handling | Potential for water contact with SPL resulting in generation of flammable and toxic gases (e.g. ammonia, methane, acetylene, hydrogen) | - Unloading is conducted inside a roofed building<br>- Roof protects from potential water/SPL contact<br>- Building is fitted with dust extraction and louver ventilation (general moisture and gases generated would be extracted)<br>- Quantity of gas generated would be relatively minor for short period moisture contact (i.e. damp air)<br>- Significant quantity of water required to generate flammable and/or toxic gases (many tonnes) |

| Site Area or Operation | Cause | Consequence | Safeguard |
|---|---|---|---|
| Treated SPL Blending Area – Shed 6 | Handling of SPL:<br>- loading SPL to feeders<br>- blending and mixing of SPL | Potential to generate dust during SPL handling<br>- operators impacted by SPL dust resulting in OH&S effects<br>- potential for dust to be released outside the SPL building and eventually offsite | - Operators are located in mechanical handling equipment (e.g. front and loaders) which are fitted with air-conditioned cabins (dust tight)<br>- The building is fitted with dust extraction equipment (and baghouse) that creates a slightly negative pressure in the building, eliminating the potential for dust release beyond the building<br>- Dust extraction equipment is fitted with fail alarms, both visual and audible (i.e. bag break through or high dP)<br>- Procedure is to cease operations unless the dust extraction equipment is functional |

Note: Once in Shed 6, the SPL is treated and compound with the potential to produce flammable or toxic gases have been removed, hence, water ingress and impact is no longer a hazard

| Site Area or Operation | Cause | Consequence | Safeguard |
|---|---|---|---|
| SPL Processing Equipment – loading hoppers, conveyors, crushers, grinders and storage silos (crushing, grinding, drying, etc, areas) | - Dust is generated as SPL is loaded to the hopper<br>- Dust generated during conveying and crushing/ grinding | Potential for dust to be released beyond confines of the equipment & building, eventual release offsite | - Feed hoppers are fitted with hoods to minimise the release of dust beyond the hopper confines<br>- All equipment is fully covered preventing dust escaping beyond the immediate confines of the equipment itself<br>- A dust extraction system is fitted to the SPL processing equipment, generating slightly negative pressure in the equipment (i.e. air is drawn into equipment therefore dust cannot escape)<br>- The building is fitted with dust extraction equipment (and baghouse) that creates a slightly negative pressure in the building, generated gas is extracted along with any dust and therefore does not have the potential to concentrate and form explosive mixtures<br>- All dust extraction equipment is fitted with fail alarms, both visual and audible (i.e. bag break through or high dP)<br>- Procedure is to cease operations unless the dust extraction equipment is functional |
| Rotary Kiln | Flame ignition fails | Gas fills kiln and ignites resulting in explosion and potential offsite impact from missiles | - Kiln is designed with a burner management system in accordance with AS1853<br>- Blast panels are installed on the kiln to prevent kiln destruction and generation of missiles<br>- Operators monitor system temperature and have manual shut down available to isolate the gas<br>- Kiln is located over 50m from the site boundary and further to adjacent industrial areas due to buffer zone around the smelter (i.e. minimal impact potential offsite) |

| Site Area or Operation | Cause | Consequence | Safeguard |
|---|---|---|---|
| Rotary Kiln | Gas flow reduced due to control system/valve failure resulting in loss of heat | Temperature in kiln falls and drops below 750$^{o}$C – potential for failure to destroy contaminants in the SPL | - Temperature control system installed on the kiln<br>- Thermocouples monitor temperature and maintain it between 750$^{o}$C and 800$^{o}$C<br>- Low temperature shut down and alarm installed on the system (i.e. shuts gas off in event of temperature lower than 750$^{o}$C)<br>- Operators monitor system temperature and have manual shut down available to isolate the gas |
| Rotary Kiln | Gas flow increases due to control system/valve failure resulting in increased temperature | Temperature in the kiln rises above 850$^{o}$C – potential for fluoride release to atmosphere and offsite impact | - Temperature control system installed on the kiln<br>- Thermocouples monitor temperature and maintain it between 750$^{o}$c and 800$^{o}$C<br>- High temperature shut down and alarm installed on the system (i.e. shuts gas off in event of high temperature in excess of 800$^{o}$C)<br>- Operators monitor system temperature and have manual shut down available to isolate the gas |
| Hydro mixer | Gas shut down in kiln | Pressure in kiln rises and extraction of gas from hydro mixer fails resulting in toxic/flammable gas escape to atmosphere | - Failure of gas results in shut down of all kiln systems (including hydro mixer)<br>- Quantity of SPL in the hydro mixer is relatively small, resulting in small quantities of gas generated once the water is isolated<br>- Gas will be contained in the mixer preventing release into the atmosphere surrounding the plant (i.e. no impact offsite from gas release)<br>- Hydro mixer is part of the kiln mixer system which is fitted with blast doors |

| Site Area or Operation | Cause | Consequence | Safeguard |
|---|---|---|---|
| Treated SPL Loadout | Failure to connect loading spout and truck together correctly or component failure in loadout system (i.e. split pipe, split nozzle, nozzle not connected properly) | Processed SPL spill onto the truck or around the truck | - Processed SPL is inert and generally non hazardous<br>- Truck loading area is bunded<br>- Operators are present during all transfer operations (i.e. can stop transfer if required)<br>- Equipment is regularly inspected and worn components replaced<br>- CCTV used to monitor loadout from the control room |

# APPENDIX B

# SPL-WATER MIX ANALYSIS

# B1 AMMONIA RELEASE FROM SPL AND WATER MIXING

## B1.1 General

The SPL proposed for processing at the Tomago facility contains a variety of materials which are detailed in the MSDS presented at **Appendix C**. Although not listed, aluminium carbides and nitrides may impregnate the SPL as a result of contact with dross materials in the pot. A typical level of carbide/nitride in dross would be about 10% aluminium nitride with smaller quantities of aluminium carbide. The MSDS shows in Appendix C, does not list aluminium nitride and carbide in the constituents, however, this MSDS is for new SPL and contaminants contained in the SPL from contact with dross would not be shown in new SPL. The MSDS also shows that fluoride is present in the material (0.09-0.22) and trace quantities of sodium cyanide (<0.001). In mixing water with the SPL, ammonia would be released as the predominant gas with smaller amounts of acetylene, methane, hydrogen cyanide and hydrogen fluoride.

The analysis in this section is performed to determine the release quantities of the various gases from an SPL-water mix, based on 1kg of water. The above description of SPL indicates that there could be contamination from the aluminium nitrides and carbides, the description section of the study estimates that this contamination could be about 1% (conservative).

## B1.2 Ammonia Release

### B1.1.1 Chemical Reactions

The mixing of water and SPL results in a reaction that takes place according to the equation:

$$AlN + 3(H_2O) \rightarrow NH_3 + Al(OH)_3.$$

This calculation assumes that all water mixing with SPL is available for reaction. However, this is not usually the case in water SPL mixes. In reality, other reactions take place in conjunction with the aluminium nitride/water reaction above. One important reaction is:

$$2\ AlN + 3\ (H_2O) \rightarrow 2NH_3 + Al_2O_3$$

This reaction creates significant heat, liberating water in the form of vapour and steam. Hence, not all the water is available for reaction. To ensure the analysis is conservative it has been assumed that all water is available for the reaction, hence, overestimating the quantity of flammable/toxic vapours produced.

### B1.1.2 Release Rate Calculations

For this analysis a base value of 1 litre (or 1kg) of water has been used to determine the unit quantity of gas released per litre/kg of water.

Mass of water = 1kg

A stoichiometric mixture of 1 mole of AlN (0.41kg) and 3 moles of $H_2O$ (0.54kg) gives 1 mole of $NH_3$ (0.17kg). Therefore the mass of ammonia released per kg of water is given by:

$$\text{Mass of ammonia produced/kg of water} = \frac{1\text{kg } H_2O \times 0.17 \text{ kg } NH_3}{0.54\text{kg } H_2O}$$
$$= 315\text{g ammonia/kg of water}$$

Noting that this analysis is conservative as all water will not be available for generation of ammonia due to heat and side reactions such as those demonstrated below in **Sections B2 & B3**.

## B1.3 Nature and Properties of Evolved Ammonia Releases

It is important at this stage to discuss the nature and properties of ammonia that are critical in understanding the behaviour of the gas after it has been released. Anhydrous ammonia (or liquid ammonia) is stored at 840kPa(abs.) at ambient temperature (20$^o$C). Hence, when anhydrous ammonia is released it immediately commences to vaporise, absorbing heat from the surroundings. This causes a reduction in temperature of the released gas/liquid which increases the gas density, making heavier than air in the immediate area of the release point. Further, as the gas in this form is highly saturated, it is highly hygroscopic, and is therefore absorbed by the water vapour in the air resulting in an ammonia water molecule that is also heavier than air. In general, a release of anhydrous ammonia acts as a dense gas, although the gas molecule itself is lighter than air.

The gas release due to water/ SPL mix is not anhydrous. The gas is formed as a result of a chemical reaction between the water and aluminium nitrides in the SPL. This reaction is exothermic, hence the gas is released at above ambient temperature and does not cool during the release period. The gas in this form is less hygroscopic and tends to remain as a gas (i.e. does not mix with water vapour) during and after the release. Under these circumstances, the gas is buoyant, as the molecular weight of ammonia (17) is much lighter than air (≈28).

# B2 OTHER GASES RELEASED FROM SPL AND WATER MIXING

## B2.1 General

The evolution of other gases, such as acetylene, methane, hydrogen cyanide and hydrogen fluoride would be limited due to the alkaline nature of the SPL water mix (i.e. aluminium hydroxide formation).

Acetylene and methane are produced from minor quantities of aluminium carbide in the SPL. The SPL at Tomago is not listed as having significant quantities of nitrides or carbides as the new SPL does not contain these materials, however, these contaminants may be present in quantities up to 1%, with a predominance of nitride (see **Section B1.1**). On average about 0.1% aluminium carbide content may be found in the SPL. Hence, based on 1% Nitrides and 0.1% carbides (i.e. 10:1 ratio of nitrides to carbides), the water available to nitride/carbide would be 10:1 (or 90% to 10% respectively). This ratio has been used in the analyses conducted later in this section.

Aluminium carbide comes in two forms, $Al_2C_6$ and $Al_4C_3$ (Ref.11-main report). When mixed with water, the former produces acetylene, the latter methane. The SPL contains, relatively, only trace amounts of cyanide bearing compounds, hence, releases of cyanide would not be sufficient to generate a toxic cloud resulting in offsite effects. At the levels of gas evolution expected from the SPL water mix postulated in this analysis, hydrogen fluoride (HF) would not be an acute toxic gas. Further, as the mixture would be alkaline, there is little potential for HF production as the chemical reaction forming HF is suppressed by alkaline conditions. Based on this analysis, there is no further consideration of hydrogen cyanide or hydrogen fluoride release.

In some cases high humidity can affect SPL and release toxic and flammable gases. The high humidity can cause a slow reaction at the surface of the SPL releasing ammonia, acetylene, methane, hydrogen cyanide and hydrogen fluoride. The reaction would occur at the surface only, releasing insignificant quantities of gas. Nevertheless over a period of time, these gases can build up in confined spaces leading to dangerous and flammable atmospheres. The proposed TAC SPL storage area is fully vented with draft fans drawing air from the storage space through dust collection units thus preventing build up of gas in the storage area.

Fresh air is currently drawn into the storage area as air is removed from the space by the fans. The fans operate on a 24 hour basis, reducing the likelihood of gas build up in the building. The slow release rate of gas and the vent fans result in a low risk of toxic or flammable gas build up at this facility.

## B2.2 Chemical Reactions

The mixing of water and SPL results in a reaction that takes place according to the equation:

$Al_2C_6 + 3(H_2O) \rightarrow C_2H_2 + Al_2O_3$

and

$Al_4C_3 + 6\ H_2O \rightarrow 3\ CH_4 + 2\ Al_2O_3$

Assuming each of the carbides mix stoichiometrically with water, the following amounts of acetylene and methane are produced:

$Al_2C_6$ = 1kg of water mixed with 2.33kg of carbide leads to 1.44kg of acetylene

$Al_4C_3$ = 1kg of water mixed with 1.33kg carbide leads to 0.44kg of methane.

# B3 MASS OF WATER REQUIRED TO RELEASE HAZARDOUS LEVELS OF AMMONIA, ACETYLENE & METHANE

## B3.1 General Theory

The density of a gas in a specified volume can be determined from the relationship:
Density [$\rho$] = molecular weight/22.412 grams/litre.

Each material has a specific hazard level at which ignition will occur (lower explosive limit or LEL for flammable gases – acetylene and methane) or toxic impact will occur (ammonia). These levels are:

- Ammonia ($L_{C50}$)– 11,500ppm (Ref.8 – main report)
- Acetylene (LEL) – 2.3% or 23,000ppm (Ref.7 – main report)
- Methane (LEL) – 5% or 50,000ppm (Ref.7 - main report)

The volume of water required to generate the specific levels of hazardous gas can therefore be calculated using the density relationship and the hazard levels above. This analysis is conducted in detail below.

## B3.2 Water Required to Generate Hazardous Levels of Ammonia

An elevation and end elevation of the building in which the SPL will be stored is shown at **Figure B1**. The volume of the building from the dimensions shown is 22,744m$^3$.

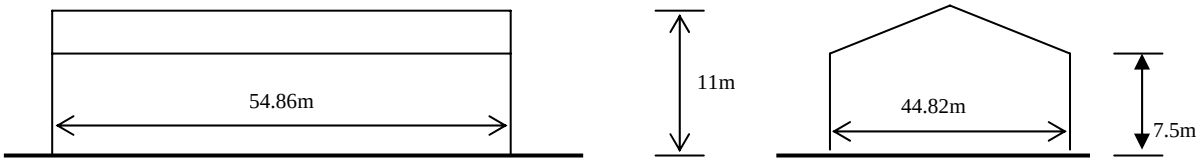

**FIGURE B1**
**DIMENSIONS OF SPL STORAGE BUILDING**

Whilst it is recognised that localised water mixing and higher concentrations of the gas may be present at specific locations, personnel impacted by the gas at these locations may leave the area and move to an uncontaminated area, which will facilitate recovery from any symptoms of impact. It has been assumed that only a building full of gas at a hazardous level will result in impact to personnel as they will not be able to escape to a clear area in sufficient time.

Hence, if ammonia gas filled the full volume of the building, the density of gas would be:
Density [ρ] = molecular weight/22.412 grams/litre

Where molecular weight of ammonia is 17 (based on the chemical formula of $NH_3$)

Density = 17/22.412 = 0.76grams/litre or kg/$m^3$

The selected hazardous impact level for ammonia is 11,500ppm or 0.0115 of the normal density of the gas in a given space. Hence, the density of ammonia in air at 11500ppm = 0.0115 x 0.76 = 0.0085 kg/$m^3$. The volume of the building is 22,744$m^3$, therefore the mass of ammonia released, in order to reach 11,500ppm, would need to be 0.085 x 22,744 = 193.3kg.

From **Section B1.1.2**, the quantity of ammonia produced per kg water is 0.315kg and it was stated above (**Section B2.1**) that only 90% of the water is available for ammonia production (the remaining 10% goes to acetylene/methane production). Therefore the amount of water required to produce 193.3 kg of ammonia is:

Quantity of water = 193.3/(0.315 x 0.9) = 682kg.

This analysis assumes complete mixing and all water available for ammonia production (i.e. no account of side or exothermic reactions).

## B3.3 Water Required to Generate Hazardous Levels of Acetylene

By similar analysis to that conducted above for ammonia:

Density [ρ] = molecular weight/22.412 grams/litre

Where molecular weight of acetylene is 26, based on a chemical formula of $C_2H_2$.

Density = 26/22.412 = 1.16grams/litre or kg/$m^3$

The selected hazardous impact level for acetylene (LEL) is 23,000ppm or 0.023 of the normal density of the gas in a given space. Hence, the density of acetylene in air at 23,000ppm = 0.023 x 1.16 = 0.027 kg/$m^3$. The volume of the building is 22,744$m^3$, therefore the mass of acetylene released, in order to reach 23,000ppm, would need to be 0.027 x 22,744 = 614kg.

From **Section B1.1.2**, the quantity of acetylene produced per kg water is 1.44kg and it was stated above (**Section B2.1**) that only 10% of the water is available for acetylene/methane production, which has been apportioned to half of this amount (5%) for each gas. Therefore the amount of water required to produce 614 kg of acetylene is:

Quantity of water = 614/(1.44 x 0.05) = 8,528 kg or 8.5 tonnes.

This analysis is very conservative and assumes complete mixing and all water assumed available for acetylene production will produce the gas (i.e. no account of side or exothermic reactions). Hence, in reality, more water would be required to produce an acetylene LEL in the building.

## B3.4 Water Required to Generate Hazardous Levels of Methane

By similar analysis to that conducted above for ammonia and acetylene:

Density [$\rho$] = molecular weight/22.412 grams/litre = 16/22.412 = 0.71grams/litre or kg/$m^3$

The selected hazardous impact level for methane (LEL) is 50,000ppm or 0.05 of the normal density of the gas in a given space. Hence, the density of methane in air at 50,000ppm = 0.05 x 0.71 = 0.0355kg/$m^3$. The volume of the building is 22,744$m^3$, therefore the mass of methane released, in order to reach 50,000ppm, would need to be 0.0355 x 22,744 = 807.4kg.

From **Section B1.1.2**, the quantity of methane produced per kg water is 0.44kg and it was stated above (**Section 2.1**) that only 10% of the water is available for acetylene/methane production, which has been apportioned to half of this amount (5%) for each gas. Therefore the amount of water required to produce 340 kg of methane is:

Quantity of water = 807.4/(0.44 x 0.05) = 36,700kg or 36.7 tonnes.

This analysis assumes complete mixing and all water assumed available for methane production will produce the gas (i.e. no account of side or exothermic reactions).

## B3.4 Summary of Water Requirements to Generate Hazardous Quantities of Toxic & Flammable Gases

The quantities of water required to generate hazardous levels of toxic and flammable gases are presented in **Table B1**.

**TABLE B1**
**SUMMARY OF LEVELS OF WATER REQUIREMENTS TO GENERATE HAZARDOUS QUANTITIES OF FLAMMABLE & TOXIC GASES**

| Flammable/Toxic Gas Generated | LEL or $LC_{50}$ (in the bld) | Quantity of gas Generated | Quantity of Water Required |
|---|---|---|---|
| Ammonia ($NH_3$) | 11,500ppm | 193. | 682 |
| Acetylene ($C_2H_2$) | 2.3% | 614 | 8.5 tonnes |
| Methane ($CH_4$) | 5% | 807.4kg | 36.7 tonnes |

## Section 2 - HAZARDS IDENTIFICATION

**STATEMENT OF HAZARDOUS NATURE**
**HAZARDOUS SUBSTANCE. DANGEROUS GOODS. According to the Criteria of NOHSC, and the ADG Code.**

**POISONS SCHEDULE**
S6

RISK
Reacts violently with water liberating extremely flammable gases.
Harmful if swallowed.
Contact with acids liberates very toxic gas.
Causes burns.
Risk of serious damage to eyes.
Harmful: danger of serious damage to health by prolonged exposure through inhalation.
Harmful: danger of serious damage to health by prolonged exposure through inhalation and if swallowed.
Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

SAFETY
Never add water to this product.

Keep locked up.
Do not breathe dust.
Avoid contact with eyes.
Wear suitable protective clothing.
Keep container dry.

Use only in well ventilated areas.

Keep container in a well ventilated place.

Take off immediately all contaminated clothing.
In case of accident or if you feel unwell IMMEDIATELY contact Doctor or Poisons Information Centre (show label if possible).

| sulfur | 7704-34-9. | 0-2^ |
| free cyanide | | 0-0.1 |

## Section 4 - FIRST AID MEASURES

**SWALLOWED**

- If swallowed do NOT induce vomiting.
- If vomiting occurs, lean patient forward or place on left side (head-down position, if possible) to maintain open airway and prevent aspiration.
- Observe the patient carefully.
- Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious.
- Give water to rinse out mouth, then provide liquid slowly and as much as casualty can comfortably drink.
- Seek medical advice.

**EYE**

If this product comes in contact with the eyes:
- Immediately hold eyelids apart and flush the eye continuously with running water.
- Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.
- Continue flushing until advised to stop by the Poisons Information Centre or a doctor, or for at least 15 minutes.
- Transport to hospital or doctor without delay.
- Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

**SKIN**

If skin contact occurs:
- Immediately remove all contaminated clothing, including footwear.
- Flush skin and hair with running water (and soap if available).
- Seek medical attention in event of irritation.

**INHALED**

- If dust is inhaled, remove from contaminated area.
- Encourage patient to blow nose to ensure clear breathing passages.
- Ask patient to rinse mouth with water but to not drink water.
- Seek immediate medical attention.

# Executive Summary

AECOM Australia Pty Ltd (AECOM) was engaged by Regain Services Pty Ltd (Regain) to undertake a Human Health Risk Assessment (HHRA) for their Regain Tomago facility located within the Tomago Aluminium site (the Site). The Site location is shown on **Figure F1**, **Appendix A**, while the Site setting and surrounding land uses is illustrated on **Figure F2, Appendix A**.

The HHRA supports the Environmental Assessment (EA) prepared by AECOM as part of the Part 3A Modification Request (06_0050 MOD 2) to Project Approval 06_0050 under *Environmental Planning and Assessment Act 1979 (NSW)* (EP&A Act). The project includes consideration and assessment of the proposed increase in Spent Pot Lining (SPL) processing capacity from 20kT to 60kT per annum at the Regain Tomago facility. The proposed modification includes:

- Operation of a 20,000 tpa and 40,000 tpa thermal treatment plant (consisting of a rotary kiln and water reaction mixer) and associated emission points;
- Operation of a dust collector servicing Shed 5 (where SPL preparation activities are undertaken) and an associated emission point;
- Operation of a drying plant dust collector and associated emission point;
- Operation of a fine grinding plant and associated emission points; and
- Revising the previously approved site layout to accommodate the revised plant configuration.

The NSW Department of Planning and Environment (DP&E) Environmental Assessment Requirements (EARs) were issued for the proposed modification (06_0050 MOD 2) on 20 December 2017. The EARs required that the EA must include an assessment of the potential human health risks associated with the processing of SPL.

This HHRA has been prepared to assess the potential health risks to surrounding human receptors resulting from exposure to Regain Tomago air emissions associated with the processing of SPL during normal operations and at the proposed maximum Environment Protection Licence (EPL) limits of the facility.

Two future operating scenarios were considered as part of the HHRA, as detailed in the table below.

| Scenario ID | Scenario Name | Description | Consideration in HHRA |
|---|---|---|---|
| **1** | Typical Operating Conditions | • Based on standard operating conditions, with the SPL facility operating continuously at the proposed 60 kT per year.<br>• All existing point sources modelled using average source emission data.<br>• Scenario 1 is considered to be most representative of the future operating conditions with the proposed SPL facility. | Chronic health assessment as this scenario was considered to represent conservative operating conditions at the Site. |

| Scenario ID | Scenario Name | Description | Consideration in HHRA |
|---|---|---|---|
| **2** | Proposed Maximum EPL Limits | • SPL facility operating continuously using proposed maximum EPL limits.<br>• All existing point sources modelled using average source emission data.<br>• Scenario 2 is representative of theoretical worst-case impacts using the proposed maximum licence limits and is unlikely to ever occur, and if so unlikely to be for long periods of time. | Chronic health assessment as this scenario was considered to represent theoretical worst case operating conditions at the Site. |

Potential acute or upset conditions were not assessed as there were no upset conditions that were considered likely for the SPL facility (i.e. the facility has an auto shutdown feature which ceases emissions from the stacks if there are operational issues).

The following human receptors were considered in this HHRA based on the surrounding land uses:

- Off-site residents, including caravan parks;
- Off-site recreational users; and
- Off-site commercial workers.

Exposure to air and deposition of particulates (which could deposit onto soil) was identified as a potential exposure pathway which warranted higher tiers of assessment. Pathways that have been considered to be complete for the Site and were therefore assessed in the HHRA include:

- Inhalation of vapours and dust in indoor and outdoor air (inhalation pathway assessment).
- Ingestion of home-grown fruit and vegetables by residents (multiple exposure pathway assessment).
- Ingestion of eggs from home-grown chickens by residents (multiple exposure pathway assessment).
- Ingestion of home-grown beef (multiple exposure pathway assessment).
- Ingestion of breast milk by infants (multiple exposure pathway assessment).

The maximum annual average ground level concentrations ($100^{th}$ percentile) at each receptor and grid maximum concentrations were adopted for Scenario 1 (normal operational conditions) and Scenario 2 (operational conditions at proposed maximum EPL limits). Additionally, annual dust deposition rates for the identified bioaccumulative contaminant were used to estimate contaminant concentrations in soil for consideration in the multiple pathway assessment for both scenarios.

Scenario 1 (Normal Operational Conditions)

Using maximum annual average exposure point concentrations (EPCs) and grid maximum EPCs, estimated conservative screening (upper-bound) Incremental Lifetime Cancer Risk (ILCR) estimates for off-site receptors considered in the inhalation and multiple pathway assessments were found to be below the adopted acceptable risk level of $1 \times 10^{-5}$, and hazard indices were below the adopted acceptable hazard index of 1.0.

Scenario 2 (Operational Conditions at Proposed Maximum EPL Limits)

Using the maximum annual average EPCs estimated conservative screening (upper-bound) ILCR estimates for off-site receptors considered in the inhalation and multiple pathway assessments were found to be below the adopted acceptable risk level of $1 \times 10^{-5}$, and hazard indices were below the adopted acceptable hazard index of 1.0.

Using the grid maximum EPCs estimated conservative screening (upper-bound) ILCR estimates for off-site residents considered in this multi-exposure parameter assessment for Scenario 2 were found to be below the adopted acceptable risk level of $1 \times 10^{-5}$, and the hazard indices were marginally above the adopted acceptable hazard index of 1.0. However, this scenario is considered to be overly conservative i.e. a resident exposed to the modelled maximum annual average concentration at the operational conditions for the proposed maximum EPL limits for all Chemicals of Potential Concern (CoPC), for 24 hours a day, 365 days a year for 30 years. Scenario 2 is representative of theoretical worst case impacts operating at licence limits and is unlikely to be realised. Additionally, the grid maximum location was identified approximately 80 metres (m) north-west of the Site, on land currently zoned as General Industrial and not as residential land.

While these risk estimates were based on a number of conservative assumptions and were considered to overestimate actual risk to receptors, it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels. Overall the estimated health risks to off-site residents, recreational users and commercial workers from inhalation and residents from direct contact pathways under normal and at the proposed maximum licence limit operating conditions were considered low and acceptable.

# 1.0 Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by Regain Services Pty Ltd (Regain) to undertake a Human Health Risk Assessment (HHRA) for their Tomago facility located within the Tomago Aluminium site (the Site). The Site location is shown on **Figure F1**, **Appendix A**, while the Site setting and surrounding land uses is illustrated on **Figure F2, Appendix A**.

## 1.1 Background

The HHRA supports the Environmental Assessment (EA) prepared by AECOM as part of an application to modify Project Approval 06_0050 under the *Environmental Planning and Assessment Act 1979* (EP&A Act). The project includes consideration and assessment of the proposed increase in Spent Pot Lining (SPL) processing capacity from 20kT to 60kT per annum at the Regain Tomago facility. The proposed modification includes:

- Operation of a 20,000 tpa and 40,000 tpa thermal treatment plant (consisting of a rotary kiln and water reaction mixer) and associated emission points;
- Operation of a dust collector servicing Shed 5 (where SPL preparation activities are undertaken) and an associated emission point;
- Operation of a drying plant dust collector and associated emission point;
- Operation of a fine grinding plant and associated emission points; and
- Revising the previously approved site layout to accommodate the revised plant configuration.

Environmental Assessment Requirements (EARs) were issued by the NSW Department of Planning and Environment (DP&E) for the proposed modification (06_0050 MOD 2) on 20 December 2017. The revised EAR's required that that the EA must include an assessment of the potential human health risks associated with the processing of SPL.

This HHRA has been prepared to assess potential health risks to surrounding off-site human receptors resultant from the exposure to Regain Tomago air emissions associated with the proposed increased processing of 60,000 tpa of SPL at the facility. The evaluation of the risks to on-site workers involved in the operation of the SPL processing facility has not been evaluated as their exposures are addressed via the implementation of appropriate occupational health and safety procedures and management plans.

This HHRA has been has been written in conjunction with other available technical reports including:

- AECOM, 2018. Air Quality Impact Assessment, Regain Tomago – Project Modification. AECOM Australia Pty Ltd. August 2018.

## 1.2 Objective

The objective of the HHRA is to assess potential health risks to surrounding identified human receptors that may be exposed to emissions from the modified Regain Tomago facility.

## 1.3 Framework and Methodology

The HHRA was undertaken in accordance with relevant nationally adopted guidelines for a health risk assessment, including:

- Environmental Health Risk Assessment: Guidelines for Assessing Human Health Risks from Environmental Hazards. Department of Health and Ageing and enHealth Council, Commonwealth of Australia (enHealth, 2012a).
- Australian Exposure Factor Guide, Department of Health and Ageing and enHealth Council, Commonwealth of Australia (enHealth, 2012b).

- National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM) 1999, National Environment Protection Council (NEPC), as amended and in force on 16 May 2013 (ASC NEPM, 2013).
- Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities. Office of Solid Waste, US Environmental Protection Agency (US EPA, 2005).

Additionally, the HHRA was consistent with the NSW Environment Protection Authority (EPA) Guidelines for the NSW Site Auditor Scheme (3rd Edition) (NSW EPA, 2017).

## 1.4 Scope of Work

The scope of work for the risk assessment, in accordance with enHealth (2012a) and ASC NEPM (2013) guidance included the following five stages:

### 1.4.1 Stage 1: Issues Identification

The purpose of Stage 1 was to identify the problems that the risk assessment needed to address and to establish the context for the risk assessment. It comprises a number of phases, including:

- review of existing reports applicable to the HHRA (as identified in **Section 1.1**) to determine whether further assessment of potential human health risks was required.
- identification of Chemical of Potential Concern (CoPC) and determination of whether there are hazards amendable to risk assessment;
- setting the hazards into their environmental health context;
- identification of potential interactions between the agents, to include transport and migration pathways; and
- stating why a risk assessment was required, and the scope and objectives of the HHRA.

This stage included the development of a Conceptual Site Model (CSM) for the Site outlining the source-pathway-receptor linkages. This is further discussed in **Section 4.0**.

### 1.4.2 Stage 2: Hazard Identification

During Stage 2, the potential hazards from the CoPC identified in Stage 1, were identified by characterising the adverse health effects that might be caused by long term exposure to the CoPC. This included an assessment of chronic health effects (during typical operating conditions).

This was achieved by undertaking a review of toxicity information published by Australian or international regulatory agencies (e.g. National Health and Medical Research Council (NHMRC), World Health Organization (WHO), Agency for Toxic Substances and Disease Registry (ATSDR), United States Environmental Protection Agency (US EPA)).

### 1.4.3 Stage 3: Dose-Response Assessment

The Stage 3 dose-response assessment examines the quantitative relationships between exposure to the CoPC and the associated health effects. The determination of whether there is a hazard is often dependent on whether a dose-response relationship is present. Relevant toxicity values for the identified CoPC will be obtained from sources recognised by Australian regulatory agencies in accordance with the hierarchical approach detailed in Section 5.12 of enHealth, 2012a.

Incremental impacts and appropriate slope factors (unit risk factors) were used for compounds where no acceptable “safe” threshold is provided (i.e. carcinogenic compounds). For those threshold compounds (i.e. non-carcinogenic compounds), appropriate reference concentrations (RfC) were used following an adjustment for background exposure (see below). It should be noted that some compounds are considered to be both threshold and non-threshold, and have been assessed as such.

AECOM took into consideration background exposure that the human receptors may have to the threshold CoPC assessed in the HHRA, and adjusted (i.e. reduced) the published toxicity data accordingly. Background exposure is the extent to which the exposed population is exposed to the CoPC in food, drink, ambient air and consumer products as part of their daily lives.

### 1.4.4 Stage 4: Exposure Assessment

During Stage 4, AECOM assessed the exposure magnitude, frequency, extent, character and duration for the identified sensitive receptors and the potential exposure pathways.

Appropriate human exposure parameters were selected in accordance with enHealth (2012b) and ASC NEPM (2013).

In accordance with enHealth (2012a) guidance, it was assumed that the concentration of vapours and particulates inside a building was 100% of the level predicted in the outside air.

### 1.4.5 Stage 5: Risk Characterisation

Risk characterisation is the qualitative and/or quantitative estimate outcome of the risk assessment. During this stage the nature and potential incidence of adverse health effects to receptors based on comparison of estimated contaminant intake or exposures to relevant toxicity (dose-response) criteria was characterised. The risk estimate for each individual chemical and exposure pathway was summed to produce the cumulative risk estimate for each exposure scenario.

For non-threshold (carcinogenic) CoPC, the incremental lifetime cancer risk estimates for each receptor was compared to an *acceptable* carcinogenic risk level of 1 in 100,000 ($1 \times 10^{-5}$) (enHealth, 2012a).

For threshold (non-carcinogens) CoPC, potentially *unacceptable* chemical intake/exposure was indicated if the exposure level exceeded the Tolerable Daily Intake (TDI) or Tolerable Concentration (TC) (i.e. if the HQ is greater than 1.0) (enHealth, 2012a).

If the risk acceptability criteria for non-threshold and threshold CoPC were exceeded, a more detailed and critical evaluation of the risk was conducted, or appropriate risk management measures were recommended.

A sensitivity and uncertainty analysis was undertaken that includes a discussion of the key uncertainties associated with the HHRA process and the assumptions adopted for the exposure modelling. The risk estimates should be considered in the context of identified uncertainties.

# 2.0 Site Description and Setting

## 2.1 Site Description

**Table 1 Site Details**

| Item | Description |
|---|---|
| Site Identification | Regain Tomago SPL processing Facility |
| Site Address | 638 Tomago Road, Tomago, NSW 2322 |
| Title Identification Details | Lot 3 DP 808004 |
| Site Owner | Regain Services Pty Ltd |
| Site Location | Tomago Aluminium site (blue rectangle) and the Regain SPL processing facility (green border) is shown in **Figure F1, Appendix A** |
| Local Context | **Figure F2, Appendix A** |
| Current Site Layout | **Figure F3, Appendix A** |

The Site is zoned as *IN1– General Industrial* under the Port Stephens Local Environmental Plan 2013. It is noted that the area surrounding the Site is zoned RE1 (public recreation), IN1 (general industrial), E2 (environmental conservation) and RU2 (rural landscape) (refer to **Figure F2, Appendix A**).

## 2.2 Site Location

The Regain SPL processing facility (a 0.9 hectare site) is located within the existing Tomago Aluminium smelter site (a 500 hectare site) situated on the NSW east coast approximately 13 km northwest of the central business district of Newcastle. The site is within the Port Stephens local government area (LGA), on Tomago Road, Tomago NSW. The regional context of the Tomago Aluminium site (blue rectangle) and the Regain facility (green border) is shown in **Figure F1, Appendix A.** The current Regain SPL facility layout within the Tomago Aluminium site, including the stack locations are presented in **Figure F3, Appendix A**.

## 2.3 Surrounding Land Uses

The current land uses, based on Council zoning, surrounding the Site are shown on **Figure F2 Appendix A**. A description of the surrounding land uses are provided in **Table 2** below.

**Table 2 Surrounding Land Uses**

| Direction from Site | Land Use |
|---|---|
| North | Undeveloped land and an industrial plant (unknown name), beyond which are large areas of undeveloped land, followed by the Hunter Region Botanic Gardens. |
| East | Undeveloped land and Industrial facilities including the Varley Group (engineering and manufacturing), Setco Australia, Redicrete, Compass Pools Australia. Further east is undeveloped land and more industrial facilities including Glade Manufacturing and Sales, Omega Chemicals Kyzac Coatings and Hunter Valley Concrete Pumping Service. |
| South | Commercial/Industrial facilities including Biz Industries, Wheeler Cranes and Brent and Warburton (engineering) and some areas of undeveloped land, beyond which is Tomago Road. Across Tomago road are Tomago Bowling and Sporting Club, Tomago Periodic Detention Centre, TW Woods Construction and Tank Solutions, beyond which is the Hunter River. The Hunter Wetlands National Park is located south of the River. |
| West | A small strip of undeveloped land, followed by commercial/Industrial facilities including ATB Morton, PPK Mining Equipment Pty, IOR Petroleum Newcastle, beyond which is Old Punt Road. More commercial/industrial properties are located across Old Punt Road including J.A Martin Electrical and Hunter Valley Compressors. The Tomago Village Van Park is located further west of the site. |

## 2.4 Current Site Operations

Tomago Aluminium has three potlines, each containing 280 pots used for the smelting of Aluminium. Potlining has a life cycle of six to seven years, over which time it becomes contaminated with materials such as alumina, aluminium, calcium, fluoride compounds and sodium. Cyanide compounds and aluminium carbide can also be created in the reducing atmosphere of the pots and infiltrate the potlining. The deteriorated potlining, known as spent potlining (SPL), is regularly replaced as part of the periodic individual rebuilding of the pots. Potlining is typically removed in two stages. First-cut SPL is the removed carbon cathode lining, whilst second-cut SPL is the removed refractory lining. SPL is removed from the pots at the smelter's Deline facility.

The current SPL processing plant and amenities are located in two adjacent existing buildings on the Tomago Aluminium site, known as SPL Sheds 5 and 6. SPL Shed 5 is adjacent to the Tomago Aluminium Deline facility, where the SPL is removed from the pots. Each building is 55 m long x 50 m wide (floor area of 2,750 $m^2$). The building sides (north and south) are fitted with louvre type ventilation panels. The steel retaining walls are sealed to the floor excluding the two doorways per building.

The current approval associated with the 2009 EA provided for plant items as follows:

- Materials preparation – including SPL crushing, sizing, grinding and storage facilities.
- SPL Thermal treatment – including a rotary kiln and water reaction mixer.
- Product plant – including blending, drying and final product crushing and storage facilities.

Existing plant constructed to date is in general accordance with the project description provided in the ENSR/AECOM, 2009 *Environmental Assessment, Construction and Operational of a Spent Potliner Processing Facility* (2009 EA), Tomago which stated that:

- The heat treatment plant (which would include a rotary kiln and water reaction mixer) and product plant (where grinding and blending, drying, final product crushing and storage would be undertaken) would be located between Shed 5 and Shed 6; and
- Plant associated with the existing 20,000 tpa plant, including conveyors, crushing, grinding and sizing equipment, raw material and product bins, etc., may be retained and utilised in the proposed project.

### 2.4.1 Discharge Points

All externally-located plant is enclosed, and all emissions from the project occur via independent dust extraction and collection points:

- Thermal treatment plant dust collector.
- SPL Shed 5 and Deline facility air filter (SPL preparation facilities).

The SPL processing and product storage facilities are fully sealed, including covered conveyors and sealed atmospheric storage bins. Ductwork is installed throughout the process plant system and connected to dust generating areas such as mills, crushers, conveyors, storage bins and the kiln/dryer. The dust extraction systems maintain a negative pressure within the process system and buildings, preventing the escape of fugitive dust.

Dust is collected via the baghouse dust collectors, which is fitted with alarm systems to immediately shut down plant operations in the event of baghouse failure. Visual and audible alarms sound within the plant buildings, with the alarm displaying on the plant control system monitoring display. Collected particulate matter feed back through the production cycle.

The dust extraction systems draws air from within each building at the roof ridgeline, and pass it through dust filter/baghouse facilities. The air discharge from each baghouse is directed to atmosphere via stacks. The solid discharge from each baghouse is collected and fed to the products blending hopper.

### 2.4.2 Control Measures

Regain has developed an extensive control system for their facilities to manage air emissions from their plant. Control measures are focused around the operation of suitable baghouse dust collectors and process operational controls e.g. control of process materials, housekeeping etc.

The approved SPL processing facility is operated and maintained to ensure the following:

- Mitigation of fugitive emissions by maintaining the processing plant and buildings under negative pressure.
- Destruction of cyanide and hazardous gases by control of the processing stages.
- Minimal formation of incomplete combustion products and liberation of gaseous fluoride by control of the thermal treatment process (i.e. maintaining the temperature below 850$^{o}$C).
- Minimal emissions of particulate matter and particulate-bound contaminants such as fluoride by the appropriate operation of baghouse dust collectors.
- Minimal dust generation from concrete apron areas by the application of appropriate housekeeping practices.

## 2.5 Proposed Site Modifications and Operations

The project is to modify the existing SPL processing facility on site at the Tomago Aluminium smelter which reduces the hazardous nature of a waste material through thermal treatment thereby recycling a waste material into a useable end-product.

The project (as modified) would generally comprise:

- Materials preparation: This would involve SPL crushing and sizing, and would be located in Shed 5. Quantities of SPL would continue to be stockpiled in Shed 5. No modification to existing material preparation processes is proposed as a result of this modification;
- Thermal treatment: This would involve a heat treatment process which would destroy the cyanide and neutralise the flammable gas hazard associated with SPL while retaining valuable materials such as carbon, fluorides, and other inorganic compounds. Thermal treatment would occur between Shed 5 and Shed 6;

- Product preparation: The product plant would involve drying and grinding treated SPL to suit product specification. Product plant elements would be located between the two existing buildings;
- Storage of materials: Quantities of SPL would continue to be stored in Shed 5. Treated product would be stored in Shed 6; and
- Daily truck movement to and from site for unloading SPL material for treatment and loading for delivery and distribution of treated products via road trucks.

To reach the target capacity of 60,000tpa and other product specifications, it is proposed to operate an optimised configuration utilising the thermal treatment process elements of both the originally proposed project and an additional thermal treatment plant and fine grinding mill. An overview of the revised project configuration which pertains to this air quality impact assessment is provided in **Table 3**.

**Table 3 Overview of Revised Project Configuration**

| Project Configuration (2009 EA) | Revised Project Configuration |
|---|---|
| Stack 1 - Thermal treatment plant dust collector (EPL Point 1) | Stack 1 – Thermal treatment plant dust collector (EPL Point 1) |
| | Stack 2 - Additional thermal treatment plant dust collector (New EPL Point) |
| Stack 2 Drying and blending plant dust collector (EPL Point 2) | Stack 3 – Drying plant (EPL Point 2) |
| | Stack 4 – Fine Grinding Stack (New EPL Point) |
| Stack 3 - Shed 5 and Deline facility air filter (EPL Point 3) | Stack 5 - Shed 5 and Deline facility air filter (EPL Point 3) |

A conceptual layout of the modified site plan associated with the Project, including the location of the as-built SPL Processing Plant, and the proposed new fine grinding plant and drying plant is provided in **Figure 1**.

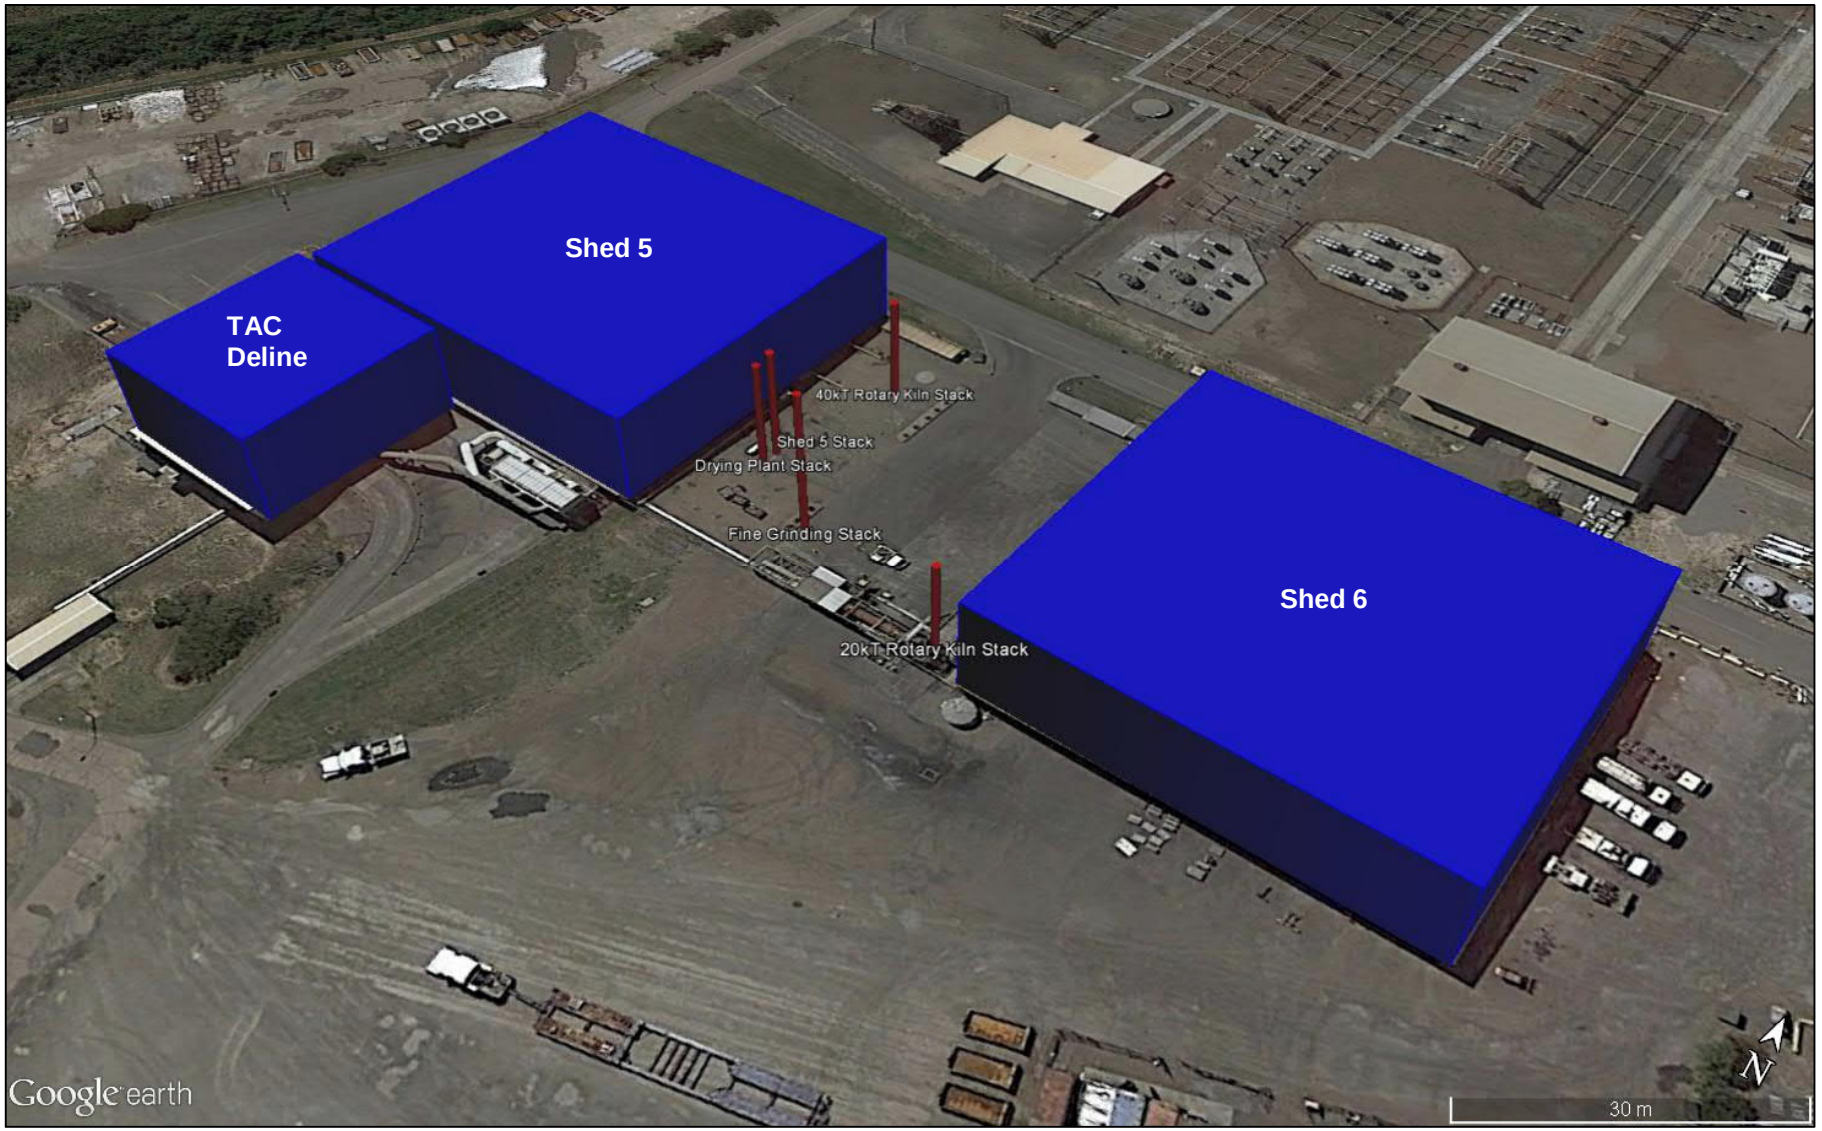

**Figure 1 Regain Tomago Facility Layout**

## 2.6 Meteorological Conditions

The meteorological conditions used in the dispersion modelling are detailed in the *Air Quality Impact Assessment, Regain Tomago – DA Modification* (AECOM, 2018) and are summarised below.

The Bureau of Meteorology (BoM) records long-term meteorological data at a number of automatic weather stations across the country. The BoM operate a meteorological weather station at Williamtown (Station number 061078) located approximately 12km east northeast of the site, and records temperature, rainfall, wind speed and wind direction. Selected long-term regional meteorological data were obtained from the BoM Williamtown monitoring station; a summary is provided in the following sections.

### 2.6.1 Climate

The study area experiences a warm to moderate climate. The warmest temperatures occur during the summer months, with the highest average maximum temperature (28.1$^{o}$C) occurring in January. July is the coldest month, with a recorded average minimum temperature of 6.4$^{o}$C.

The annual average rainfall for the area is 1127 millimetres (mm) over 85 days a year. June is the wettest month, with an average rainfall of 121 mm, while August is driest month with an average rainfall of just 60.5mm. Humidity follows a diurnal cycle, with higher humidity in the morning compared to the afternoon.

### 2.6.2 Wind Direction

Wind speed and direction are largely affected by topography at the small scale, while factors such as synoptic scale winds affect wind speed and direction on the larger scale. Wind speed and direction are important variables in assessing potential air quality impacts, as they dictate the direction and distance air pollutant plumes travel.

Daytime wind speeds were found to be moderate, with higher wind speeds occurring in the afternoon compared to the morning. The annual average 9am wind speed recorded is 13.7 kilometres per hour (km/h) and the annual average 3pm wind speed was 20.2 km/h. Seasonally, wind speeds are higher during the warmer months with the highest average wind speed occurring in December at 23.5 km/h. The long-term wind roses show that on an annual basis the dominant wind direction is from the northwest quadrant during the mornings and from the southeast quadrant during the afternoons.

## 2.7 Existing Air Quality

The NSW Environment Protection Authority (EPA) operates a number of air quality monitoring stations in the Lower Hunter. The closest monitoring station site to the Regain Tomago site is located at Beresfield (5 km of the Site). This station records hourly particulate concentrations ($PM_{10}$ and $PM_{2.5}$) using a Tapered Element Oscillating Microbalance (TEOM), nitrogen dioxide ($NO_2$) and sulfur dioxide ($SO_2$).

The ambient air quality monitoring data is presented in the Air Quality Impact Assessment (AECOM, 2018) and a summary of the monitoring data for the project is provided in **Table 4**.

**Table 4 Adopted Background Air Quality Pollutant Concentrations**

| Pollutant | Averaging Period | Adopted Concentration (µg/m$^3$) | % of Criteria | Assessment Criteria (µg/m$^3$) |
|---|---|---|---|---|
| Sulfur Dioxide ($SO_2$) | 1 hour | 214.8 | 38 | 570 |
| | 24 hours | 73.4 | 32 | 228 |
| | Annual | 9.8 | 16 | 60 |
| Nitrogen Dioxide ($NO_2$) | 1 hour | 92.1 | 37 | 246 |
| | Annual | 16.9 | 27 | 62 |
| Carbon Monoxide (CO) | 1 hour | N/A | N/A | 30,000 |
| | 8 hour | 1.5 | 0.02 | 10,000 |

| Pollutant | Averaging Period | Adopted Concentration (µg/m$^3$) | % of Criteria | Assessment Criteria (µg/m$^3$) |
|---|---|---|---|---|
| $PM_{10}$ | 24 hour | 43.3 | 87 | 50 |
| | Annual | 18.7 | 75 | 25 |
| Lead | Annual | N/A | N/A | 0.5 |
| Total Suspended Particulates | Annual | N/A | N/A | 90 |
| Hydrogen Fluoride (general land use) | 90 days | 0.20 | 40 | 0.5 |
| | 30 days | 0.81 | 96 | 0.84 |
| | 7 days | 1.18 | 69 | 1.7 |
| | 24 hours | N/A | N/A | 2.9 |
| Cyanide | 1 hour | N/A | N/A | 200 |
| Dioxins & Furans | 1 hour | N/A | N/A | $2x10^{-6}$ |
| PAH's as benzo(a)pyrene | 1 hour | N/A | N/A | 0.4 |
| Antimony | 1 hour | N/A | N/A | 9 |
| Arsenic | 1 hour | N/A | N/A | 0.09 |
| Cadmium | 1 hour | N/A | N/A | 0.018 |
| Chromium | 1 hour | N/A | N/A | 0.09 |
| Manganese | 1 hour | N/A | N/A | 18 |
| Mercury | 1 hour | N/A | N/A | 1.8 |
| Nickel | 1 hour | N/A | N/A | 0.18 |
| Acetone | 1 hour | N/A | N/A | 22,000 |
| Benzene | 1 hour | N/A | N/A | 29 |
| Toluene | 1 hour | N/A | N/A | 360 |

# 3.0 Assessment of Data

## 3.1 Introduction

Air quality data used in the HHRA were derived from dispersion modelling provided in the following report:

- AECOM, 2018. Air Quality Impact Assessment, Regain Tomago – Poject Modification. AECOM Australia Pty Ltd. 22 August 2018.

AECOM has adopted 1-hour annual average ground level concentrations and grid maximum concentrations in the HHRA. For non-volatile CoPC, annual average and grid maximum dust deposition rates were adopted.

Two operating scenarios (SPL processing at typical operating conditions and SPL processing at expected licence limits) were considered as part of the HHRA. Potential acute or upset conditions were not assessed as there were no upset conditions that were considered likely for the SPL facility. The facility employs auto shutdown features which cease operations if operational issues are encountered. The building dust extraction system, including filter bags, would be fitted with a visual and audible alarm system that would sound within the plant buildings to immediately shut down plant operations in the event that the dust extraction failed. Continuous baghouse temperature monitoring (via temperature probes) would be linked to an alarm system that would alarm and shut down the plant if the inlet gas temperature to the baghouses exceeded 130$^{o}$C.

## 3.2 2018 Air Quality Impact Assessment, Regain Tomago – Project Modification

This air quality impact assessment was undertaken for the proposed capacity increase modification to the Regain facility located within the Tomago Aluminium site at Tomago, NSW. The proposed modification includes increasing the processing capacity of the site from 20,000 tpa to 60,000 tpa , by the addition of a 40,000 tpa Rotary Kiln, as well as construction of a Fine Grinding Plant. The main emissions of concern for this assessment associated with the proposed Regain operations include a range of primary air pollutants and principal air toxic substances, released during the thermal treatment of SPL.

The air quality assessment examined the existing air quality and local meteorology, outlined the relevant air quality standards and guidelines, detailed the assessment methodology through the use of the air dispersion model CALPUFF and considered the effects on air quality from the potential operational emissions.

The dispersion modelling was undertaken for the operational scenario as discussed in **Table 5**.

**Table 5 Assessment Scenarios**

| Scenario ID | Description |
|---|---|
| 1 | Proposed 60kT Operations (Maximum EPL Emission Concentrations Scenario)<br>• Assumed 24 hour operations<br>• Emission rates calculated from the maximum EPL concentration limits listed in the Regain Tomago license for:<br>- 20kT Rotary Kiln Stack (EPL Point 1)<br>- 40kT Rotary Kiln/Dryer Stack (EPL Point 2)<br>- Shed 5 Stack (EPL Point 3)<br>- Fine Grinding Mill Stack (Proposed EPL Point 4)<br><br>*Note 1 – Where no available limit was listed in the current EPL for the expected pollutants from that source, a commensurate EPL limit was proposed in line with the current limits imposed on EPL Point 1.*<br><br>*Note 2 – For the speciated VOC's, where no EPL Limit was available for a pollutant to* |

| Scenario ID | Description |
|---|---|
| | *assess in this scenario, the percentage ratio of each species compared to the Total VOC's of the available measured stack testing data from the Regain site was used to determine an appropriate emission rate.*<br><br>*Note 3 - For all Type 1 & 2 Metals, where no EPL Limit was available for the individual species, the percentage ratio of each elemental species compared to the Total Type 1 & 2 substances of the measured stack testing data from Regain site was used to determine an appropriate emission rate.* |

Gridded receptors were selected covering a 6km x 6km grid, with 200m spacing between receptors. Additionally, a denser grid of receptors was added in a 2km x 2km grid centred on the Regain facility with 50m spacing between them. The gridded receptors were selected to ensure a representative sample of all nearby potential sensitive receptor locations were included in this assessment.

The assessment indicates that the proposed modification to the Regain facility in isolation from background pollutant sources is not likely to result in any exceedances of the ground level concentration criteria for any pollutants assessed in this AQIA. Although there was a cumulative exceedance of the short term 30-day Hydrogen Fluoride criteria predicted by the modelling, it is principally the result of the high background levels of ambient fluoride associated with the operation of the aluminium smelter within which the Regain facility is located. Additionally, the industrial location of the receptors which may potentially exceed the criteria are unlikely to be impacted by the marginally increased levels of ambient fluoride associated with the Regain contribution as there are no sensitive flora or grazing animals present.

A Green House Gas (GHG) inventory was also prepared as part of this assessment, which predicts an increase in GHG emission intensity associated with the increased production capacity, however the facilities overall contribution is very small to the state and national GHG emissions, and not expected to be of concern.

It is recommended that Regain apply the same operational mitigation measures currently in place at the facility for the 20,000 tpa rotary kiln to the additional 40,000 tpa rotary kiln to ensure the facility is able to minimise any potential for environmental harm. Additionally, it is recommended that Regain undertaken biannual emissions monitoring of all point source locations once they are all installed and operational to continually demonstrate compliance with currently licensed (and proposed) EPL concentration limits.

## 3.3 Data Gaps

Some data gaps which may impact the HHRA were identified based on a review of the available reports and data. Identified data gaps and the manner with which they have been addressed are summarised in **Table 6**.

**Table 6 Data Gaps**

| Data Gap | Potential Significance | Addressed in HHRA |
|---|---|---|
| Inherent uncertainty of air dispersion modelling | **Moderate**: Conservatism of the air quality data.<br><br>Models predict maximum concentrations for any specific set of input data (i.e. they predict the maximum concentrations that would result from a large set of observations under the specific conditions being modelled). However, for any specific hour with those exact maximum hourly conditions, the predicted ground level concentrations will never exactly match the actual pattern of ground level concentrations, due to the effects of random turbulent motions and random fluctuations in other factors such as temperature. | The HHRA has adopted annual 1-hour average concentrations based on meteorological data from a representative year (2015) to be representative of overall conditions and to account for some of the uncertainty associated with dispersion modelling.<br><br>In addition, the grid maximums have been modelled for the identified receptors. This is considered to be conservative as the location of the grid maximum is directly adjacent to the western boundary of the Site, within the general industrial zoned area.<br><br>Further, the distribution of Total PAH compounds analysed were based on measured PAH stack concentrations from 2014 to 2016. |
| It is not known when the Regain Tomago Facility will have offline periods for maintenance. | **Low**: No data available | The HHRA and AQIA (AECOM 2018) conservatively assumed that the Site will operate continuously for 24 hours per day, 7 days per week. Therefore, if the Site was to be non-operational for periods, the air quality impacts are likely to decrease. |
| Potential future changes of land use surrounding the Site to more sensitive uses. | **Moderate:** Identification of potential human receptors was based on a review of the Port Stephens Local Environmental Plan 2013. If these land uses were to change to more sensitive uses, the risk profile to off-site receptors would likely increase. | To address any sensitive land use changes in the future, the HHRA includes an assessment using the grid maximum ground level concentration i.e. highest annual average (chronic) ground level concentrations reported from the dispersion modelling. Adopting grid maximum concentrations ensures that the most sensitive receptor is being assessed with a 'worst-case' exposure point concentration. |

| Data Gap | Potential Significance | Addressed in HHRA |
|---|---|---|
| No assessment of consumption of chickens has been undertaken | **Low** – Not considered to be a significant pathway<br><br>Excluding potentially complete exposure pathways may result in an underestimated assessment of the potential risk to human health. | The Site is located within a predominantly industrial area with residents that may keep chickens located approximately 760 m for the Site. Given the residential area is low-density and not agricultural, similar to the assumptions made in the ASC NEPM (2013), pullet chickens are considered to be kept for egg production and not for consumption purposes. |
| No assessment of upset conditions has been undertaken | **Low:** Not assessed. | The facility employs auto shutdown features which cease operations if operational issues are encountered. The building dust extraction system, including filter bags, would be fitted with a visual and audible alarm system that would sound within the plant buildings to immediately shut down plant operations in the event that the dust extraction failed. Continuous baghouse temperature monitoring would alarm and shut down the plant if the inlet gas temperature to the baghouses exceeded 130$^{o}$C.<br><br>It is considered that there are no upset conditions which would cause acute inhalation exposures from the SPL facility. |

# 4.0 Issues Identification

## 4.1 Data Used in the HHRA

The AQIA (AECOM 2018) provides details of the air dispersion modelling methodology and air quality results. The AQIA included modelling of relevant chemicals of potential concern (CoPC) during the operation of the Regain Tomago Facility (discussed in **Section 4.2**) and estimating representative ground level concentrations and deposition rates for each CoPC at each human receptor and grid maximum. Specifically, the data used in the chronic health assessment is outlined below in **Section 4.1.1**. The locations where grid maximum concentrations are discussed are presented in **Section 4.1.3**.

### 4.1.1 Chronic Health Assessment (Scenario 1 and Scenario 2)

For the chronic HHRA, for both Scenario 1 (typical operating conditions) and Scenario 2 (operating conditions at the proposed maximum licence limits), 1-hour annual average ground level concentrations (as $\mu g/m^3$, $100^{th}$ percentile[1]) at each receptor (i.e. residential, recreational and commercial) and grid maximum concentrations (discussed in **Section 4.1.3**) were adopted as these were considered to represent current and future off-site human exposure conditions. The '1-hour annual average concentration' is the average value (concentration) of the 1-hour averages that were predicted over an entire year. The 'grid maximum' is the highest concentration reported from all arbitrary gridded receptors.

For non-volatile CoPC, annual average and grid maximum dust deposition rates[2] (as $mg/m^2$/year) were estimated based on the anticipated source emission rates under typical operating conditions and at the proposed maximum EPL limits. The deposition rates were used to determine the levels of pollutants that may deposit onto soil and therefore be present via a number of additional exposure pathways other than inhalation. The deposition modelling realistically assumes dry (as opposed to wet) deposition and is estimated in CALPUFF using a multi-layer resistance model. Dry deposition entails gravitational settling, impaction and diffusion to surfaces and results in greater dispersion (i.e. emissions travel further) than wet deposition which "washes out" some airborne emissions.

### 4.1.2 Receptor Locations

The coordinates and description of the locations of the maximum 1 hour annual average ground level concentrations for each off-site receptor are presented below in **Table 7**.

**Table 7 Receptor Locations**

| Receptor | Scenario | X Coordinate | Y Coordinate | Description of Location |
|---|---|---|---|---|
| Commercial for Scenarios 1 and 2 | Chronic Scenario (Maximum annual average GLCs) | 379464 | 6367607 | Adjacent to the western boundary of the Site within the general industrial zoned area (refer to **Figure F2**). |
| | Chronic Scenario (Maximum annual dust deposition rates) | | | |
| Residential for Scenarios 1 and 2 | Chronic Scenario (Maximum annual average GLCs) | 379929 | 6366674 | Corrective Services NSW Academy located 0.8 km southeast of the site (refer to **Figure F2**). |
| | Chronic Scenario (Maximum annual | | | |

[1] It should be noted that the HHRA conservatively adopted $100^{th}$ percentile model predications for each averaging period while the Air Quality Assessment adopted the $99.9^{th}$ percentile in accordance with The Approved Methods.
[2] Given that particulate matter less than 2.5 micrometres are not readily affected by gravitational settling, to generate a non-zero outcome, deposition modelling was completed based on an assumption that all particulate matter is released within the 10 micrometre ($PM_{10}$) size fraction. This is considered conservative for deposition purposes, and in reality the particulate is anticipated to lie within the $PM_{2.5}$ size fraction. Deposition estimates were derived through conventional atmospheric dispersion modelling, using the assumption of particulate in the 10 micrometres in aerodynamic diameter

| Receptor | Scenario | X Coordinate | Y Coordinate | Description of Location |
|---|---|---|---|---|
| | dust deposition rates) | | | |
| Recreational for Scenarios 1 and 2 | Chronic Scenario (Maximum annual average GLCs) | 381500 | 6366900 | Tomago House and Chapel, a function and National Trust venue for hire for recreational purposes is located approximately 1.9 kilometres southeast of the site (refer to **Figure F2**). |
| | Chronic Scenario (Maximum annual dust deposition rates) | | | |

### 4.1.3 Grid Maximum Locations

The coordinates and a description the grid maximum location for Scenario 1 and Scenario 2 are provided in **Table 8**.

**Table 8 Grid Maximum Locations**

| Scenario | X Coordinate | Y Coordinate | Description of Location |
|---|---|---|---|
| Chronic Scenario (Maximum annual average GLCs) | 379464 | 6367607 | Adjacent to the western boundary of the Site within the general industrial zoned area (refer to **Figure F2**). |
| Chronic Scenario (Maximum annual dust deposition rates) | | | |

## 4.2 Contamination Sources

The operations of the Regain Tomago Facility has been described in detail, including emission sources, air emission controls, building characteristics, stack heights and potential emission concentrations in the AQIA (AECOM 2018). shows the stack parameters used in the assessment.

**Table 9 Summary of Modelled Emission Points**

| Source | Units | 20,000 tpa Rotary Kiln Stack | 40,000 tpa Rotary Kiln Stack | Shed 5 Stack | Fine Grinding Mill Stack | Drying Plant Stack |
|---|---|---|---|---|---|---|
| Easting | mE MGA94 | 379631 | 379605 | 379598 | 379609 | 379598 |
| Northing | mN MGA94 | 6367514 | 6367551 | 6367534 | 6367523 | 6367531 |
| Height | mAGL | 12.52 | 14.10 | 14.94 | 20.26 | 14.94 |
| Temperature | K | 359 | 360[1] | 299[2] | 306[3] | 324[3] |
| Inside Diameter | m | 0.9 | 1.1 | 1.1 | 0.75 | 0.75 |

Source: Air Quality Impact Assessment, Regain Tomago – DA Modification (AECOM 2018b)

For the purposes of the HHRA, the emissions associated with each source have been conservatively evaluated as occurring concurrently for 24 hours a day seven days per week.

## 4.3 Chemicals of Potential Concern

Chemicals of potential concern (CoPC) are those chemicals which are suspected to be emitted from the stacks at concentrations that may present a risk to human health. The prime objective of identifying CoPC is to focus the HHRA on assessing chemicals that have the potential to significantly contribute to risks to human health.

The CoPC considered part of this HHRA was sourced from the AQIA (AECOM 2018), which reported the results of air dispersion modelling for the following CoPCs:

- Antimony
- Arsenic
- Cadmium
- Chromium
- Lead
- Manganese
- Mercury
- Nickel
- Acetone
- Benzene
- Toluene
- Cyanide
- Dioxins and Furans
- Total PAHs as benzo(a)pyrene and naphthalene*.

* The speciated breakdowns of the Total PAH stack testing results collated from 2014 to 2016 indicated that the average contribution of BaP to the Total PAH was 0.0099%, and the average contribution of naphthalene and 2-methylnapthalene to the Total PAH was 22% and 42% respectively. Thus, it was considered overly conservative to assume BaP represented 100% the Total PAH concentration. As such, only the carcinogenic PAHs (Benzo(a)anthracene, Benzo(b+j)fluoranthene, Benzo(k)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz(a,h)anthracene, and Indeno(1,2,3-c,d)pyrene) have been assessed as BaP. The average percent contribution of the carcinogenic PAHs to the Total PAH is 0.67%. The remaining contribution of PAHs (99.3%) has been assessed as naphthalene.

The speciated breakdowns of the Total PAH stack testing results are presented in **Appendix G**.

In addition to the air toxics, the following Criteria pollutants have been modelled as part of the AQIA (AECOM 2018):

- Particulate matter (PM), emitted as TSP and PM10
- Hydrogen Fluoride (HF)
- Sulphur Dioxide ($SO^2$)
- Oxides of nitrogen (NOx) (expressed as nitrogen dioxide ($NO_2$))
- Carbon Monoxide (CO).

## 4.4 Potential Contaminant Transport Pathways

Potential transport mechanisms by which CoPC may migrate off-site are summarised in **Table 10** below.

**Table 10 Potential Contaminant Transport Pathways**

| Transport Mechanism | Comments | Likelihood or Significance |
|---|---|---|
| Release of vapours and particulates to ambient air from the Site | Vapours and particulates may be emitted to the atmosphere via stacks (identified in **Section 2.4**). | Potentially Medium-High as dispersion modelling has indicated that vapour and particulates released from the on-site sources (i.e. stacks) are being reported at off-site receptor locations.<br>It has been conservatively assumed that all CoPC are released as a vapour, volatile or not, to assess the cumulative risk associated with emissions. |
| Deposition of particulates (dust) onto off-site soils | Dust emitted from the Site may settle from the atmosphere onto exposed off-site soils. | Potentially Medium-High as dispersion modelling has indicated that dust (or non-volatile particulates) is emitted from on-site sources (i.e. stacks). Low-density residential, recreational and commercial land has been identified nearby the Site where exposed soil may be present (refer to **Section 4.1.2**). |
| Uptake of chemicals by home-grown produce (i.e. fruit and vegetables) from off-site soils and deposited dust | Following deposition of dust onto off-site plants and soils, home-grown produce may uptake chemicals active adsorption (see further discussion below regarding vapour-to-leaf transfer). | Medium given low-density residential land where home-grown produce could be present has been identified nearby the Site. |
| Uptake of chemicals by poultry (chickens) from off-site soils and transfer to eggs | Following deposition of dust onto off-site soils, chickens may uptake chemicals present in soil via ingestion. | Medium given low-density residential land where chickens could be present has been identified nearby the Site. AECOM has assumed residents will keep backyard poultry for egg production rather than consumption purposes. |
| Uptake of chemicals by grazing flora (i.e. grass) from off-site soils and ingestion by grazing fauna (i.e. sheep and cattle). | Following deposition of dust onto off-site soils, sheep and cattle may uptake chemicals present in grazing flora. | No diary infrastructure, paddocks hosting sheep or cattle were identified within 2 km of the Site, however areas near the site are zoned as rural landscape and as such, hobby farms with cattle or sheep grazing paddocks may exist.<br>. |

Other transport mechanisms e.g. leaching from soil to groundwater or surface water, transport of leached contamination within groundwater, volatilisation and vapour migration from subsurface media, are not considered to be significant in this HHRA. The contaminant mass that may leach from soil is likely to be minimal given the high molecular weight and physio chemical properties of the contaminants which may be subject to deposition. The organic contaminants (i.e. PAHs and dioxins/furans) have high soil organic carbon-water partitioning coefficients (Koc), ranging from 6200 L/kg to 587000 L/kg, indicating they are less mobile and likely to bind to the soil. The inorganic contaminants (i.e. metals) have elevated distribution coefficients (kd), ranging from 2.1 L/kg to 1000 L/kg, indicating they are unlikely to partition to water.

As a result of the above, subsurface media is unlikely to be impacted by the operations at the Regain Tomago Facility via leaching from soil.

Vapour-to-leaf transfer was not considered to be a significant accumulation pathway as bioaccumulative CoPC considered in the multiple pathway assessment are typically not volatile (based on the henry's law constant and vapour pressure[3]) and therefore unlikely to be present in 'air'. This is further supported by the dispersion modelling results whereby negligible concentrations of non-volatile CoPC (e.g. metals) were reported in air across the grid. Therefore, with negligible concentrations of bioaccumulative CoPC in air, this is not likely to be a significant pathway of concern.

## 4.5 Potential Off-Site Human Receptors

Based on a desktop review, potential off-site human receptors were identified (as discussed in **Section 2.3**).

Overall, the following human receptors were considered in this HHRA based on the surrounding land uses:

- Off-site residents, includes caravan parks;
- Off-site commercial workers; and
- Off-site recreational users.

Off-site residents (nearest residents are located approximately 0.8 km south of the Site boundary, and a caravan park is located approximately 1.3 km west of the Site), may be exposed to vapours and particulates emitted from the Regain Tomago Facility.

The off-site residents were assumed to have gardens/accessible soil and home-grown produce which accounts for less than 10% of their fruit and vegetable intake. This assumption is consistent with the ASC NEPM (2013) for low density residential properties.

Additionally, AECOM conservatively assumed that residents may keep poultry and ingest eggs from kept poultry. In accordance with the ASC NEPM (2013) for low density residential properties, it is not considered that residents will consume poultry for consumption purposes rather for egg production in a domestic backyard. Therefore no assessment of chicken consumption has been undertaken.

Although no diary infrastructure was identified within 2 km of the Site, areas near the site are zoned as rural landscape and hobby farms with cattle or sheep grazing paddocks may exist, and as such, ingestion of beef for off-site residents has been considered as part of this HHRA. This is considered to be overly conservative given that it is unlikely that residents surrounding the Site will consume large amounts of locally grown beef as it is anticipated that the cows will be sent to slaughter for distribution to the wider NSW and Australian population.

Accordingly, a very low contribution of 1% has been assumed within the cumulative assessment for consumption of locally grown beef.

Off-site commercial workers located around the Site may be exposed to vapours and particulates emitted from the Site. All commercial receptors were assumed to be at ground level.

[3] Based on Schedule B2 ASC NEPM (2013) where a CoPC is considered to be sufficiently volatile if its Henry's law constant is greater than 1 x $10^5$ atm m3/mol and the vapour pressure is greater than 1 mm Hg at room temperature

Off-site recreational users located approximately 1 km (Hunter Wetlands National Park) and 1.9 km (Tomago House and Chapel) from the Site boundary may be exposed to vapours and particulates emitted from the Site. All recreational receptors were assumed to be at ground level.

The human receptor locations are illustrated on **Figure F4**, **Appendix A**.

To address any sensitive land use changes in the future, the HHRA includes an assessment using the grid maximum ground level concentration i.e. the highest annual average 1-hour ground level concentrations reported from the dispersion modelling. Adopting grid maximum concentrations ensures that the most sensitive receptor is being assessed with a 'worst-case' exposure point concentration.

## 4.6 Exposure Pathways

In order for a human receptor to be exposed to a chemical contaminant derived from a site, a complete exposure pathway must exist. An exposure pathway describes the course a chemical or physical agent takes from the source to the exposed individual and generally includes the following elements (US EPA, 1989):

- a source and mechanism of chemical release;
- a retention or transport medium (or media where chemicals are transferred between media);
- a point of potential human contact with the contaminated media; and
- an exposure route (e.g. inhalation or direct contact) at the point of exposure.

Where one or more of the above elements is missing, the exposure pathway is considered to be incomplete and no further assessment is required.

Pathways that have been considered to be complete for the Site and therefore were assessed in the HHRA include:

- Inhalation of vapours and dust in indoor and outdoor air (inhalation pathway assessment).
- Ingestion of home-grown fruit and vegetables by residents (multiple exposure pathway assessment).
- Ingestion of home-grown beef (multiple exposure pathway assessment)
- Ingestion of eggs from home-grown chickens by residents (multiple exposure pathway assessment).
- Ingestion of breastmilk by infants (multiple exposure pathway assessment).

Pathways that have been considered to be incomplete for the Site and therefore were not assessed in the HHRA include:

- Ingestion of home-grown pork, chicken or home-grown milk.
- Ingestion of drinking water.

A significant proportion of house dust can be attributed to soil particles that have been tracked into the indoor environment from outdoors. enHealth (2012) consider that 50% of the indoor dust is derived from the site soil, in accordance with the recommendations made by US EPA (2008; 2011). However, in this assessment AECOM has conservatively assumed that the concentration of vapours and particulates inside a building was 100% of the level predicted in the outside air.

AECOM has conservatively assumed that residents may keep poultry and ingest 100% of their eggs from kept poultry. It is not considered that residents will consume poultry, rather for egg production in a domestic backyard as it is noted that pullets which lay eggs are not for consumption purposes. Furthermore, no chicken farms were identified within Tomago area. Therefore no assessment of chicken consumption has been undertaken.

No paddocks hosting sheep or cattle were identified within 2 km of the Site. Therefore, no assessment of beef, pork or lamb consumption (including milk consumption) has been undertaken.

Given the distance of the Grahamstown Water Treatment Plant and Grahamstown Dam from the Site (approximately 4.4 km and 9 km respectively), emissions from the Regain Tomago Facility are unlikely to impact the drinking water supply for the Newcastle region. Therefore, the ingestion of drinking water was not considered to be a complete pathway in this assessment.

## 4.7 Inhalation Pathway Assessment

A number of gaseous phase compounds were identified as CoPC in **Section 4.3** i.e. CO, $SO_2$, HF, and $NO_2$. Given the nature of these compounds and their potential presence in ambient air at receptor locations (based on dispersion modelling), they have been assessed via the inhalation pathway.

Suspended particulate matter ($PM_{10}$ and TSP) was also demonstrated to be present in ambient air at receptor locations and therefore have been assessed via the inhalation pathway.

There are a number of CoPC listed in **Section 4.3** that are not considered to be volatile based on the chemical's henry's law constant (greater than 1 x $10^{-5}$ atm-$m^3$/mol) and vapour pressure (greater than 1 mm Hg at room temperature), namely heavy metals. However, for the purposes of the inhalation pathway assessment, AECOM has conservatively assumed that heavy metals are considered to be sufficiently volatile. Those CoPC that were considered to be sufficiently volatile i.e. benzene, were also assessed via the inhalation pathway.

## 4.8 Multiple Pathway Assessment

In order to assess the overall body burden from exposure to chemicals from the proposed development, AECOM have undertaken a multiple pathway assessment for chemicals which are persistent and bioaccumulative. Chemicals which are volatile have not been considered further in the assessment, as they are not considered to contribute a significant portion to deposition given their volatile nature.

The assessment and determination of chemicals which are persistent and bioaccumulative reviewed available toxicity information from the following sources:

- ANZECC, 2000. *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*. Australian and New Zealand Environment and Conservation Council (ANZECC) and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ), October 2000.
- Agency for Toxic Substances & Disease Registry (ATSDR) Toxicological Profiles, available at http://www.atsdr.cdc.gov/toxprofiles/index.asp.
- DEH, 2005. National Dioxins Program, Technical Report No. 12, Human Health Risk Assessment of Dioxins in Australia. Office of Chemical Safety, Australian Government Department of the Environment and Heritage, Canberra. July 2005.
- NHMRC, 2016. National Water Quality Management Strategy, Australian Drinking Water Guidelines 6 2011, Version 3.2. National Health and Medical Research Council. Updated February 2016.
- WHO, 2011. Guidelines for Drinking-water Quality. Fourth Edition. World Health Organisation. July 2011.

The assessment has been conducted using the annual average deposition rates which have been used to estimate a chemical concentration within soil for the chronic health assessments.

It is also noted that the adoption of deposition rates for estimates within residential areas is conservative, as the deposition rates do not take into account the presence of buildings, enclosures, green houses, fencing etc., which will affect the rate of dispersion of a particulate.

The dry deposition rates have been adopted and soil concentrations have been estimated using the approach detailed within the following documents:

- Health Effects of Municipal Waste Incineration, Chapter 5 2,3,7,8 Tetrachlorodibenzo-p-Dioxin in the Agricultural Food Chain: Potential Impact of MSW Incineration on Human Health, Jeffery B. Stevens, CRC Press 1991.
- US EPA (2005) Human Health Risk Assessment Protocol (HHRAP) for Hazardous Waste Combustion Facilities, Final September 2005

Further detail on the equation is provided in **Appendix E**.

Once present within the soil or on plants, the chemicals have been considered for the following pathways:

- Uptake by edible plants within roots, stems and leaves which are consumed by residents.
- Uptake by backyard chickens who lay eggs which are consumed by residents.
- Direct contact by residents of surficial soils during gardening. An assessment of incidental ingestion and dermal contact has been undertaken.
- Uptake by beef cattle which may be consumed. It is however considered unlikely that the residents surrounding the site will consume the beef, as it is considered that the cows would be transported to the nearest abattoir and then processed through the commercial food chain.
- Uptake via all pathways detailed above by breast feeding mothers and exposures to infants.

The assessment of the potential exposure pathways detailed above has been undertaken in accordance with the guidance detailed above and:

- US EPA, 1989. Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual. Interim Final, Office of Emergency and Remedial Response, United States Environment Protection Agency (US EPA), Washington DC, OSWER Directive 9285.7-0/a.

The assessment of multiple pathway exposure was conservatively undertaken based on the Regain Tomago Facility operating for 100 years.

**Section 4.3** and **Table 11** detail the specific CoPC which were considered for the multiple pathway assessment.

**Table 11 Bioaccumulative and/or Persistent Chemicals**

| CoPC | Bioaccumulative and/or Persistent (Yes/No) | Source |
|---|---|---|
| Antimony | No | ATSDR (1992), ANZECC (2000) and WHO (2003) |
| Arsenic | Yes | ATSDR (2007) |
| Cadmium | Yes | ATSDR (2012) |
| Chromium (total) | Yes | ATSDR (2012) |
| Lead | Yes | ATSDR (2007) |
| Manganese | No | ATSDR (2012) |
| Mercury | Yes | ATSDR (1999) |
| Nickel | Yes | ANZECC (2000) |
| Dioxins and furans as PCDD and PCDF | Yes | DEH (2005) |
| PAHs as benzo(a)pyrene | Yes | ATSDR (1995) |
| Benzene | No | ATSDR (2007) and ANZECC (2000) |

| CoPC | Bioaccumulative and/or Persistent (Yes/No) | Source |
|---|---|---|
| Toluene | No | ANZECC (2000) |
| Acetone | No | ASTDR (1994) |
| Cyanide | No | ASTDR (2006) |
| Naphthalene | No | ATSDR (2005) |

## 4.9 Conceptual Site Model

A Conceptual Site Model (CSM) is a site-specific qualitative description of the source(s) of contamination, the pathway(s) by which contaminants may migrate through the environmental media, and the populations (human or ecological) that may potentially be exposed. This relationship is commonly known as a Source-Pathway-Receptor (SPR) linkage. Where one or more elements of the SPR linkage are missing, the exposure pathway is considered to be incomplete and no further assessment is required.

The CSM for the Site has been prepared in accordance with Schedule B2, ASC NEPM (2013).

**Table 12** Potential Exposure Pathways

| Exposure Pathway | Off-site Residents | Off-site Commercial Workers | Off-site Recreational User |
|---|---|---|---|
| **Vapour** | | | |
| Inhalation of stack-derived vapour in indoor air | ✓ | ✓ | ✓ |
| Inhalation of stack-derived vapour in outdoor air | ✓ | ✓ | ✓ |
| **Soil / Deposited Dust** | | | |
| Incidental Ingestion of surficial soils following dust deposition | ✓ | × (a) | × (c) |
| Dermal Contact with surficial soils following dust deposition | ✓ | × (a) | × (c) |
| Ingestion of home-grown fruit and vegetables | ✓ | × (a) | × |
| Ingestion of eggs from home-grown chickens | ✓ | × (a) | × |
| Ingestion of home-grown beef | ✓ | × (a) | × |
| Ingestion of breastmilk | ✓ | × (b) | × (c) |

**Notes:** × – incomplete pathway
✓ – complete pathway

(a) Based on the surrounding land use desktop inspection undertaken by AECOM, commercial properties were typically capped with hardstand and therefore soil is not exposed for direct contact. Additionally, these commercial properties were not used to grow home-grown produce.

(b) The assessment of ingestion of breastmilk by a resident mother is considered to be protective of a commercial worker mother or a recreational user mother as the resident is exposed by more pathways and for longer periods of time.

(c) The assessment of direct contact with soil for residential receptors is considered protective of recreational users and maintenance workers as the resident is exposed for longer periods of time.

## 4.10 Tier 1 Screening Criteria

Potential contamination sources were identified in **Section 4.2**. The Tier 1 assessment aims to confirm whether these sources have the potential to be associated with unacceptable risks by comparison of reported contaminant concentrations in media of concern (i.e. ambient air) at the human receptor against conservative generic screening criteria, termed 'Tier 1' screening criteria which have been derived based on protection of human health. When the CoPC concentration is reported to be present

in the environmental media at the human receptor above Tier 1 screening criteria, further assessment of the CoPC is undertaken in the Tier 2 assessment.

CoPC in ambient air were selected based on comparison to appropriate screening criteria in accordance with the land uses surrounding the Site (i.e. residential, recreational and commercial/industrial).

### 4.10.1 6.0Selected Tier 1 Screening Criteria

For the chronic health assessment, CoPC were assessed by screening the annual average ground level concentrations at each receptor and the grid maximum concentration against the following enHealth (2012a) hierarchy of ambient air criteria:

- EPA, 2017 *Approved Methods and Guidance for the Modelling and Assessment of Air Pollutants in New South Wales.* Department of Environment and Conservation: Sydney, Australia, 2017
- NEPC, 2011. *National Environment Protection (Air Toxics) Measure 2004*, as amended 2011. National Environment Protection Council. 16 September 2011.
- NEPC, 2003. *National Environment Protection (Ambient Air Quality) Measure*, as amended 2003. National Environment Protection Council. 16 September 2011. 7 July 2003[4].
- WHO, 2010. *WHO Guidelines for Indoor Air Quality*, Selected Pollutants. World Health Organisation. Geneva 2010.
- WHO, 2005. *Air Quality Guidelines – Global Update, Particulate Matter, Ozone, Nitrogen Dioxide and Sulfur Dioxide*. Europe. World Health Organisation. 2005.
- WHO, 2000a. *Guidelines for Air Quality*. Geneva. World Health Organisation. 2000.
- US EPA, 2018. *Regional Screening Levels for Chemical Contaminants at Superfund Sites – Residential Air and Industrial Air.* United States Environmental Protection Authority. May 2018.

The Australian based guidelines published by the NEPC are considered current and appropriate as a first tier screen as they are applicable to ambient air and protective of human health over a lifetime (chronic) exposure. As stated in NEPC (2011) '*The monitoring investigation level values are levels of air pollution below which lifetime exposure, or exposure for a given averaging time, does not constitute a significant health risk. If these limits are exceeded in the short-term it does not mean that adverse health effects automatically occur*'. Additionally, the desired environmental outcome of the standards published in NEPC (2003) is '*ambient air quality that allows for the adequate protection of human health and well-being*'.

International guidelines published by WHO were adopted as a second tier screen (with the exception being benzene where the more conservative WHO value was adopted). The WHO (2010) guidelines were developed to provide a uniform basis for the protection of human health from adverse effects of indoor exposure to air pollution based on toxicological and epidemiological data. Although these guidelines are conservatively for indoor air quality (with outdoor and indoor air sources), they are considered to be protective of outdoor exposure based on exposure duration (i.e. people spend longer indoors) and likely concentrations (typically higher indoors). WHO (2005) and WHO (2000) present risk based guideline values that provide a basis for protecting public health from adverse effects of air pollutants and to eliminate or reduce exposure to those pollutants that are known or likely to be hazardous to human health or wellbeing. These guidelines apply to all WHO regions, including Australia.

Other national guidelines (i.e. US EPA, 2018) were considered as third tier screening criteria. The US EPA RSLs for residential and industrial air are health based screening levels derived using US risk equations and input parameters e.g. for carcinogens, using a unit risk value of $1 \times 10^{-6}$. AECOM notes that a number of US EPA RSLs are more conservative than those published by NEPC and WHO.

4 The desired environmental outcome of NEPM (Ambient Air) guideline is "ambient air quality that allows for the adequate protection of human health and well-being" (NEPC, 2003). AECOM notes that following a review of the NEPM (Ambient Air) guideline that the goals are designed for use in assessing air quality in regions and sub-regions and not to localised 'hotspot' areas such as industrial facilities, busy roads or mines. However, the goals can give an indication of predicted air quality for criteria pollutants (from the Regain Tomago Facility and existing air quality) with respect to the desired environmental outcome.

However, adopting these more conservative guidelines would not have a significant impact on the outcomes of the HHRA given the following:

- If carcinogenic compounds were converted the Australian acceptable unit risk level of 1 x $10^{-5}$, then the RSLs would be in the same order of magnitude as NEPC and WHO criteria e.g. benzene.
- All bioaccumulative compounds were assessed via a Tier 2 assessment regardless of exceedances of the screening criteria, which was identified in **Table 11** to be arsenic, cadmium, chromium, lead, mercury, nickel, dioxins and furans and benzo(a)pyrene.

### 4.10.2 Tier 1 Screening Results

The modelled emissions of CO, $SO_2$, $NO_2$, HF, $PM_{10}$ and TSP, lead, benzene, toluene, naphthalene, acetone, dioxins and furans, antimony, arsenic, cadmium, manganese, mercury, nickel and cyanide from the Regain Tomago Facility under typical operating conditions and at proposed maximum EPL limit operating conditions were below the selected Tier 1 screening criteria. Therefore, unless the contaminant is considered to be bioaccumulative (refer to **Section 4.11**), further assessment of these CoPC was not required. The maximum modelled annual average concentration at the proposed maximum EPL limit operating conditions for total chromium was reported to be above the adopted screening criteria at all off-site receptors. Chromium, along with other bioaccumulative CoPC has been further assessed in **Section 5.0** to **Section 6.0**.

Refer to **Table T1** (**Appendix B**) for the Tier 1 screening assessment.

The exposure-response relationships for a number of health effects associated with exposures to $PM_{10}$ and TSP is linear (i.e. there is no level or threshold below which no adverse effects have been identified). Therefore, as there is no threshold for potential adverse health effects, further assessment of particulate matter has been undertaken (refer to **Section 4.10.3**).

### 4.10.3 Particulate Matter Assessment

A cumulative assessment of particulate matter concentrations associated with the normal and proposed maximum licence limit operations of the Regain Tomago facility was undertaken in Section 7.0 of the AQIA (AECOM 2018). The cumulative assessment considered both emissions from the Regain Tomago Facility and existing air quality (refer to **Section 2.7**). This analysis was structured in accordance with the methods prescribed in DEC (2005) *The Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales* (the Approved Methods). This structure comprises a threshold based approach, whereby compliance with air quality objectives is achieved by demonstrating that the Project will not result in additional exceedances of the relevant particulate matter criteria. In an approvals context, this metric is endorsed by EPA as indicating that the Project is unlikely to results in adverse air quality impacts.

Maximum background concentrations were added to the grid maximum predicted concentrations from the Regain Tomago facility during the proposed maximum licence limit operations to assess the cumulative particulate matter concentrations (refer to **Table 13**). This provides a conservative estimate of cumulative impact as the probability of a maximum observed value occurring at the time of a maximum predicted value is very small.

**Table 13 Cumulative Assessment of Particulate Matter during the Proposed Maximum EPL Limit Operations**

| CoPC | Averaging Period | Criteria (µg/m$^3$) | Maximum Predicted Concentration (µg/m$^3$) | Maximum Background (µg/m$^3$) | Cumulative Concentration (µg/m$^3$) |
|---|---|---|---|---|---|
| **Proposed Maximum Licence Limit Operations** | | | | | |
| $PM_{10}$ | 24 hour | 50 | 3.87 | 43.30 | 47.17 |
| | Annual | 25 | 0.41 | 18.70 | 19.11 |
| Total Suspended Particulates (TSP) | Annual | 90 | 0.70 | N/A | N/A |

Source: Air Quality Impact Assessment, Regain Tomago DA Modification (AECOM 2018)

As presented in **Table 13** the scale of predicted particulate matter impacts associated with the operation of the Regain Tomago facility are minor, with maximum predicted annual $PM_{10}$ and TSP concentrations constituting less than 7.7% of the impact assessment criteria for operations at the proposed maximum licence limits. It is noted that cumulative predictions are dominated by background air quality, with a small contribution from the Regain Tomago Facility.

In addition, the worst case cumulative concentrations of $PM_{10}$ and TSP are below the 24-hour and annual criteria published by NEPC (2003) and WHO (2005). Accordingly, particulate matter emissions from the Regain Tomago Facility were considered low and acceptable.

## 4.11 Multiple Pathway Assessment

AECOM notes that the Air Quality Assessment considered emissions of CoPC that are semi-volatile or not volatile (based on Schedule B2 ASC NEPM (2013), a CoPC is considered to be sufficiently volatile if its Henry's law constant is greater than 1 x $10^{-5}$ atm-$m^3$/mol and the vapour pressure is greater than 1 mm Hg at room temperature). Non-volatile CoPC are predicted to be present at the receptor locations, these CoPC have been included in the Tier 2 assessment to ensure the cumulative risks are assessed.

A number of CoPC emitted from the Regain Tomago Facility are regarded as persistent in the environment and have the potential to bioaccumulate. Therefore, pathways other than inhalation were required to be assessed as part of the HHRA. The persistent and bioaccumulative CoPC may be emitted as particulates by deposition and accumulate on soil and in home-grown produce, poultry and eggs and potentially breastmilk resulting in the exposure of humans as detailed in **Section 4.8**.

**Table 14** below presents a summary of the CoPCs identified and considered further as part of this HHRA with respect to chronic exposures.

**Table 14 Summary of Volatile CoPC**

| Specific Air Toxics | Volatile – Inhalation Pathway Only | Dust Deposition Potential – Multiple Exposure Pathway (a) |
|---|---|---|
| antimony | ✓ | × |
| arsenic | ✓ | ✓ |
| cadmium | ✓ | ✓ |
| chromium (total) | ✓ | ✓ |
| lead | ✓ | ✓ |
| manganese | ✓ | × |
| mercury | ✓ | ✓ |
| nickel | ✓ | ✓ |
| dioxins and furans as PCDD and PCDF | ✓ | ✓ |
| PAHs as benzo(a)pyrene | ✓ | ✓ |
| naphthalene | ✓ | × |
| benzene | ✓ | × |
| toluene | ✓ | × |
| acetone | ✓ | × |
| cyanide | ✓ | × |

(a) As discussed in **Section 4.8**, those CoPC that were considered to be bioaccumulative and persistent are assessed via multiple exposure pathways.

This page has been left blank intentionally.

# 5.0 Hazard Identification

## 5.1 Hazard Identification Process

The hazard identification process requires a review of existing toxicological information from a variety of appropriate sources to describe the capacity of a specific agent to produce adverse health effects.

Toxicological profiles and associated hazards for the specific CoPC quantitatively assessed in this HHRA are provided in **Appendix F**. The toxicity values adopted in this HHRA are presented in **Table 15**.

**Table 15 Adopted Toxicity Values**

| CoPC | Inhalation Unit Risk (IUR) $(\mu g/m^3)^{-1}$ | Source | Reference Concentration (RfC) $(\mu g/m^3)$ | Source | Oral Cancer Slope Factor (CSF) $(mg/kg/day)^{-1}$ | Source | Oral Reference Dose (RfD) mg/kg/day | Source |
|---|---|---|---|---|---|---|---|---|
| antimony | - | - | 21 | RIVM (2008). Converted from TDI of 0.006 mg/kg/day. | NA | - | NA | |
| arsenic | - | - | 1 | RIVM (2000). | NA | - | 6.00E-03 | RIVM (2008) |
| cadmium | - | - | 0.005 | WHO (2000a). | NA | - | 8.00E-04 | WHO (2010) |
| chromium IV | - | - | 0.1 | ATSDR (2008) | NA | - | 1.00E-03 | ATSDR (2008) |
| lead | - | - | 0.5 | US EPA IRIS (2015). | NA | - | 3.50E-03 | NHMRC (2011) |
| manganese | - | - | 0.15 | WHO (2000a). | NA | - | NA | |
| mercury | - | - | 0.2 | WHO (2000b). | NA | - | 6.00E-04 | WHO (2011) |
| nickel | - | - | 0.02 | WHO (2003). | NA | - | 1.20E-02 | WHO (2011) |
| cyanide | - | - | 0.8 | EA (2009). | NA | - | NA | |
| dioxins and furans (PCDDs and PCDFs) | - | - | 0.00000805 | DEH (2005). Converted NHMRC TMI (70 pg/kg body weight/month) to TDI ($2.3 \times 10^{-9}$ mg/kg/day) to RfC. | NA | - | 2.30E-09 | DEH (2005) |
| PAHs as benzo(a)pyrene | 8.70E-02 | WHO (2000b). TEF (1) | - | | 5.00E-01 | WHO (2011) | NA | - |

| CoPC | Inhalation Unit Risk (IUR) $(\mu g/m^3)^{-1}$ | Source | Reference Concentration (RfC) $(\mu g/m^3)$ | Source | Oral Cancer Slope Factor (CSF) $(mg/kg/day)^{-1}$ | Source | Oral Reference Dose (RfD) mg/kg/day | Source |
|---|---|---|---|---|---|---|---|---|
| naphthalene | - | - | 3.7 | ATSDR (2005) | NA | - | NA | - |
| toluene | - | - | 5000 | US EPA IRIS (2015). | NA | - | NA | - |
| acetone (propanone) | - | - | 30900 | ATSDR (1994). Converted from chronic MRL of 13 ppm. | NA | - | NA | - |
| benzene | 6.00E-06 | WHO (2010). | 30 | US EPA IRIS (2015). | NA | - | NA | - |

Note:
NA = Not Applicable
- = No published toxicity value (not assessed as a threshold or non-threshold compound)

## 5.2 Dose-Response Assessment

The objective of the dose-response assessment is to identify the toxicity values for each CoPC to be used for the quantification of human health risk. The numerical values derived from toxicity dose-response studies are referred to collectively as toxicity values. The toxicity values adopted are based on two different approaches to the characterisation of dose-response (NHMRC, 1999 and US EPA, 2005):

- For chemicals that have the potential to result in carcinogenic effects that are associated with a genotoxic mechanism, any level of exposure is assumed to result in some incremental lifetime risk. These chemicals are therefore assessed on the basis of a non-threshold dose-response relationship.
- For other chemicals that may be associated with non-carcinogenic effect or carcinogenic effects that are not genotoxic, a threshold is considered relevant. The threshold level is considered a level whereby exposure below the threshold will not result in any adverse effects. Exceedance of the threshold level does not imply that adverse effects will occur, as there are a number of uncertainties and safety factors incorporated into the threshold value adopted, rather that other factors (e.g. exposure duration) needs to be further evaluated.

The toxicity values adopted for the CoPC in this risk assessment, and the source of the adopted values are presented in **Appendix F**. The values have been obtained (where available) from the following information sources (listed in order of preference, as per enHealth (2012a) guidance):

- National Health and Medical Research council (NHMRC) publications and documents from other joint Commonwealth, State and Territory health organisations (NHMRC 2004, 2011).
- World Health Organisation (WHO) publications (WHO 2000a, 2000b).
- Criteria published by the Agency for Toxic Substances and Disease Registry (ATSDR) (see toxicity profiles for references).
- Criteria published by US EPA sources, primarily those published by the US EPA Integrated Risk Information system (IRIS) (US EPA, 2013) (see toxicity profiles for references).
- Canadian Council of Ministers of the Environment (CCME) documents (CCME, 2010).

It is noted that, where relevant, toxicity data available from a number of sources have been reviewed with respect to currency and adequacy to identify the most appropriate value to be used in the HHRA. This approach is consistent with Section 5.12.4 (selecting data sources) of enHealth (2012a).

The following sections present additional information on the approach adopted in this assessment to the application of non-threshold and threshold dose-response (toxicity) values.

### 5.2.1 Non-Threshold Dose Response Values

The assessment of potential health effects associated with genotoxic carcinogens requires the use of non-threshold toxicity values. The values available are essentially the slope of the cancer dose-response curve for the chemical (based on relevant studies and approaches to extrapolate effects from high doses to low doses) and are termed an inhalation unit risk (IUR). The IUR (expressed as $(\mu g/m^3)^{-1}$) is used to estimate the probability of an individual developing cancer at some point in a lifetime as a result of a specific exposure.

Two compounds (benzene and BaP) presented in **Appendix E** were considered to be potential genotoxic carcinogens, and have been assessed based on non-threshold toxicity criteria. Non-threshold toxicity values adopted in this HHRA are presented in **Table 15** above.

Toxicity profiles with additional toxicological information for each compound are provided in **Appendix F**.

### 5.2.2 Threshold Dose Response Values

Potential health effects that are assessed on the basis of a threshold dose response utilise a threshold value which is typically termed an acceptable or tolerable daily intake (ADI or TDI). For the purpose of this assessment, the threshold value adopted has been termed a TDI. A TDI is a chemical intake below which it is considered that no adverse effects would occur in human populations, including sensitive sub-groups (e.g. the very young or elderly). Hence, the TDI relates to intakes from all sources, the Site related impacts as well as background intakes (where relevant).

Where relevant to inhalation exposures the threshold value is typically termed a tolerable concentration in air (TC) or reference concentration (RfC), which is an estimate of a continuous inhalation exposure concentration to people (including sensitive subgroups) that is likely to be without risk of deleterious effects during a lifetime.

The majority of the compounds presented in **Appendix F** were considered to be potential non-carcinogens, and have been assessed based on threshold toxicity criteria. Threshold toxicity values adopted in this HHRA are presented in **Table 15** above.

Toxicity profiles with additional toxicological information for each compound are provided in **Appendix F**.

### 5.2.3 Background Intakes

When evaluating potential health effects or deriving health-based investigation levels for chemicals assessed on the basis of a threshold dose-response criteria, total exposure to a given chemical (i.e. the sum of the background exposure and the substance exposure from contaminated media) should not exceed the TDI (enHealth, 2012a; ASC NEPM, 2013).

Background levels of contamination comprise chemical concentrations present in the environment as a result of everyday activities or natural sources. These chemicals may be present in food, air, water and consumer products and represent the non-Site sources of contamination exposure. This is commonly referred to as background exposure. enHealth (2012a) and ASC NEPM (2013) require that 'background exposure' be taken into account during the assessment of potential human health risk.

Background exposure is only applied to threshold contaminants (i.e. non-carcinogens) because intakes of non-threshold contaminants (i.e. carcinogens) are considered on the basis of an increase in risk, which is irrespective of background exposure. The allocation of background exposure is undertaken on a chemical-specific basis by applying a factor (%) to the threshold toxicity reference value (TRV or Reference Dose), as illustrated in the equation below:

$$TRV\ (adjusted\ for\ background\ exposure\ ) = \left(1 - Background\ (\%)\right)\ x\ TRV$$

In cases where background exposure is considered to be essentially negligible (contributing to less than 5% of the threshold TRV), no background exposure has been applied. Should background exposure be considered to comprise greater than 50% of the threshold TRV, the background exposure is generally considered to be 50% of the TRV. However, no CoPCs in this study exceeded the 50% figure and this approach was not adopted. It should be also noted that enHealth (2012a) does not recommend a specific background exposure value for an inhalation pathway.

The background exposure allocated for each of the CoPC assessed in the HHRA is summarised in each toxicity profile (presented in **Appendix F**) and **Table 16** below.

**Table 16 Background Exposure Allocations**

| CoPC | Background Allocation | Reference |
|---|---|---|
| antimony | 0% | Negligible. |
| arsenic | 0% | ASC NEPM (2013). |
| cadmium | 20% | ASC NEPM (2013). |
| chromium IV | 0% | ASC NEPM (2013). |
| lead | 0% | Negligible. |
| manganese | 20% | ASC NEPM (2013). |

| CoPC | Background Allocation | Reference |
|---|---|---|
| mercury | 10% | ASC NEPM (2013). |
| nickel | 20% | ASC NEPM (2013). |
| cyanide | 0% | ASC NEPM (2013). |
| dioxins and furans (PCDDs and PCDFs) | 57% | DEH (2004) |
| PAHs as benzo(a)pyrene | - | - |
| naphthalene | 0% | ATSDR (2005). |
| toluene | 0% | Friebel & Nadebaum (2011). |
| acetone (propanone) | 10% | Friebel & Nadebaum (2011)* |
| benzene | 20% | Friebel & Nadebaum (2011). |

* In absence of compound-specific background exposure data, the background exposure for semi or volatile CoPC has been set at 10% in accordance with the total petroleum hydrocarbon (TPH) background exposure allocation adopted by CRC CARE (2011) during derivation of the Health Screening Levels (HSLs).

# 6.0 Exposure Assessment

Exposure Assessment involves the estimation of magnitude, frequency, extent, and duration of exposure to Site-derived contamination (enHealth, 2012b).

"*Direct measurement of the exposures of the (potentially) affected population provides the best exposure data but this is not always available or practicable and default exposure factor data is often required*." (Langley, AJ (1993). In absence of direct measurement data, environmental sampling and predictive models are commonly used to estimate intakes of CoPC by the exposed populations. The key elements of exposure assessment in the context of contaminated land risk assessment are to:

- identify input values for contaminant concentrations and pathways;
- identify input values for exposed populations;
- estimate exposure concentrations; and
- estimate chemical intake.

The Air Quality Assessment provides details of the air dispersion modelling methodology and results of the air quality assessment. A summary is also provided in **Section 3.2** above.

## 6.1 Representative Exposure Point Concentrations

A key element of the risk assessment process is estimation of the concentration of Site-derived CoPC in environmental media. This concentration is commonly termed the exposure point concentration (EPC) and should be selected as a conservative estimate of the average chemical concentration in an environmental medium at the point of exposure. EPCs are determined for each site-impacted 'exposure unit', which is defined as the area throughout which a receptor moves and encounters an environmental medium for the duration of exposure. Typically, an individual receptor is assumed to be equally exposed to media within all portions of the exposure unit over the time frame of the risk assessment.

The adopted EPCs in air and dust deposition rates are presented in **Table 17** and **Table 18**.

. It should be noted that the maximum annual average ground level concentrations (100$^{th}$ percentile) at residential and commercial receptor locations and grid maximum concentrations (100$^{th}$ percentile) were adopted in the HHRA for Scenario 1 (typical operating conditions) and Scenario 2 (operating conditions at the proposed maximum licence limits). Dust deposition rates (as mg/m$^2$/year) for selected CoPC (based on bioaccumulation potential) are based on the established relationship between the anticipated in-stack concentrations under normal and proposed maximum licence limit operating conditions. It is noted that dust deposition rates include only dry deposition of particulates. The dust deposition rates are only presented for residents, as a multiple pathways were not considered to be complete for commercial workers. In addition, the multiple pathway assessment for residents is considered to be protective of recreational user exposures.

**Table 17 Exposure Point Concentrations used in the HHRA for Scenario 1 – Typical operating conditions**

| CoPC (a) | 1-hour Annual Average Concentration in Air (µg/m$^3$) | | | | Dust Deposition Rate (mg/m$^2$/year) | |
|---|---|---|---|---|---|---|
| | Grid Maximum | Off-site Resident | Off-site Commercial Worker | Off-site Recreational Worker | Off-site resident | Grid Maximum |
| Lead | 6.74E-05 | 5.03E-06 | 6.74E-05 | 7.34E-06 | 1.70E-11 | 8.79E-11 |
| PAHs as benzo(a)pyrene* | 4.33E-05 | 3.24E-06 | 4.33E-05 | 4.72E-06 | 1.09E-11 | 5.63E-11 |
| Naphthalene* | 6.42E-03 | 4.81E-04 | 6.42E-03 | 7.00E-04 | - | - |
| Benzene | 3.21E-03 | 2.41E-04 | 3.21E-03 | 3.51E-04 | - | - |
| Toluene | 4.14E-02 | 3.11E-03 | 4.14E-02 | 4.53E-03 | - | - |
| Acetone (propanone) | 3.47E-02 | 2.61E-03 | 3.47E-02 | 3.80E-03 | - | - |
| Dioxins and furans (PCDDs and PCDFs) | 2.43E-10 | 1.82E-11 | 2.43E-10 | 2.66E-11 | 6.14E-17 | 3.17E-16 |
| Antimony | 1.72E-05 | 1.27E-06 | 1.72E-05 | 1.86E-06 | - | - |
| Arsenic | 1.22E-05 | 8.81E-07 | 1.22E-05 | 1.29E-06 | 3.05E-12 | 1.59E-11 |
| Cadmium | 1.89E-04 | 1.42E-05 | 1.89E-04 | 2.06E-05 | 4.77E-11 | 2.46E-10 |
| Chromium | 1.18E-04 | 8.80E-06 | 1.18E-04 | 1.28E-05 | 2.97E-11 | 1.54E-10 |
| Manganese | 7.05E-04 | 5.29E-05 | 7.05E-04 | 7.70E-05 | - | - |
| Mercury | 1.12E-05 | 8.36E-07 | 1.12E-05 | 1.22E-06 | 2.82E-12 | 1.46E-11 |
| Nickel | 2.54E-04 | 1.91E-05 | 2.54E-04 | 2.78E-05 | 6.42E-11 | 3.31E-10 |
| Cyanide | 1.24E-02 | 9.32E-04 | 1.24E-02 | 1.36E-03 | - | - |

(a) CoPC that were considered to be bioaccumulative are assessed via multiple exposure pathways.

* Based on the speciated breakdown of the Total PAH stack testing results collated from 2014 to 2016, the average contribution of BaP to the Total PAH is 0.0099% and the average contribution of Napthalene and 2-methylnapthalene to the Total PAH is 22% and 42% respectively. As such, it was considered overly conservative to assume BaP represented 100% the Total PAH concentration. The carcinogenic PAHs (Benzo(a)anthracene, Benzo(b+j)fluoranthene, Benzo(k)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz(a,h)anthracene, and Indeno(1,2,3-c,d)pyrene ) have been assessed as BaP. The average percent contribution of the carcinogenic PAHs to the Total PAH is 0.67%, and remaining contribution (99.3%) has been assessed as naphthalene.

**Table 18 Exposure Point Concentrations used in the HHRA for Scenario 2 – Proposed Maximum Licence Limit Operating Conditions**

| CoPC (a) | 1-hour Annual Average Concentration in Air (µg/m$^3$) | | | | Dust Deposition Rate (mg/m$^2$/year) | |
|---|---|---|---|---|---|---|
| | Grid Maximum | Off-site Resident | Off-site Commercial Worker | Off-site Recreational Worker | Off-site resident | Grid Maximum |

(a) CoPC that were considered to be bioaccumulative are assessed via multiple exposure pathways

* Based on the speciated breakdown of the Total PAH stack testing results collated from 2014 to 2016, the average contribution of BaP to the Total PAH is 0.0099% and the average contribution of Napthalene and 2-methylnapthalene to the Total PAH is 22% and 42% respectively. As such, it was considered overly conservative to assume BaP represented 100% the Total PAH concentration. The carcinogenic PAHs (Benzo(a)anthracene, Benzo(b+j)fluoranthene, Benzo(k)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz(a,h)anthracene, and Indeno(1,2,3-c,d)pyrene ) have been assessed as BaP. The average percent contribution of the carcinogenic PAHs to the Total PAH is 0.67%, and remaining contribution (99.3%) has been assessed as naphthalene.

## 6.2 Estimation of Chemical Intakes

Chemical intakes were calculated for each of the CoPC via the following exposure pathways:

- Indoor and outdoor inhalation of vapour
- Incidental ingestion of surficial soils following dust deposition
- Dermal contact with surficial soils following dust deposition
- Ingestion of home-grown fruit and vegetables following dust deposition and root uptake
- Ingestion of eggs from home-grown chickens;
- Ingestion of home-grown beef; and
- Ingestion of breastmilk by infants (<6 months).

enHealth (2012a) recommends that the estimation of chemical intakes via the inhalation pathway follows the US EPA (2009) RAGS-F guidance which follows the *Inhalation Dosimetry Methodology*. This methodology supersedes the previous US EPA (1989) RAGS, Part A inhalation methodology because "*the internal dose to a chemical from the inhalation pathway is not a simple function of the inhalation rate and body weight….* [and therefore the US EPA (1989) inhalation equation] *does not comply with the principles of EPA's inhalation dosimetry procedures used to determine the human equivalent concentration (HEC) for calculating a Reference Concentration (RfC) or Inhalation Unit Risk (IUR)*") (US EPA, 2003).

The updated inhalation dosimetry methodology calculates a modified exposure concentration (EC, µg/m$^3$) which is then directly compared with a Reference Concentration (RfC, µg/m$^3$) or Inhalation Unit Risk (IUR, per µg/m$^3$) that is derived from toxicological studies. The equation used to estimate chemical intakes via inhalation of vapour and combustion particulates is as follows:

$$Exposure\ Adjusted\ Air\ Concentration\ \left(\frac{\mu g}{m^3}\right) = \frac{Cair\ \left(\frac{\mu g}{m^3}\right) x\ ET\ \left(\frac{h}{d}\right) x\ EF\ \left(\frac{d}{yr}\right) x\ ED\ (yr)}{AT\ (h)}$$

*Where*:

Cair: contaminant concentration in air (µg/m$^3$)

ET: exposure time (hours per day)

EF: exposure frequency (days per year)

ED: exposure duration (years)

AT: averaging time for threshold and non-threshold CoPC (hours)

The EPCs presented in **Section 6.1** will be used as the '*contaminant concentration in air (µg/m$^3$)*' when calculating the exposure concentration for each CoPC in this HHRA. The values representing ET, EF, ED and AT are presented in **Section 6.3** below.

Equations for the additional direct contact (i.e. ingestion and dermal contact) exposure pathways are presented in **Appendix E**.

The assessment has also considered the potential for multiple pathway exposure, which is dependent on inhalation and body weight to calculate appropriate intake factors. Therefore the equations (as outlined in **Appendix E**) have also been undertaken to be incorporated in the multiple pathway assessment.

## 6.3 Human Behavioural Exposure Parameters

Human behavioural exposure parameters adopted in this risk assessment were obtained from the following recognised Australian and international sources:

- enHealth (2012a) Environmental Health Risk Assessment, Guidelines for Assessing Human Health Risks from Environmental Hazards. Department of Health and Ageing and enHealth Council, Commonwealth of Australia
- enHealth (2012b) Australian Exposure Factor Guide, Department of Health and Ageing and enHealth Council, Commonwealth of Australia
- ASC NEPM (2013) National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM) 1999, National Environment Protection Council (NEPC), as amended and in force on 16 May 2013, specifically, Schedule B4, Guideline on Site-Specific Health Risk Assessment Methodology
- USEPA (1989) Risk Assessment Guidance for Superfund Volume I – Human Health Evaluation Manual Part A. United States Environmental Protection Agency Office of Emergency and Remedial Response. Washington DC, Revised December 1989; and associated updates.

Where specific guidance was not available from the above or other literature sources, conservative estimates for exposure parameters were adopted. Human exposure parameters adopted for the assessment, their source and justification are presented in **Table 19** to **Table 21.**

below. Additional exposure parameters that are pathway specific are provided in **Appendix E**.

In accordance with the *Inhalation Dosimetry Methodology* described in **Section 6.2** above, consideration of body weight and inhalation rates are not required for the inhalation exposure pathway. As outlined above, these parameters were considered when calculating the average maternal intake (mg/kg/day) as adult intakes for each CoPC.

**Table 19 Human Behavioural Exposure Parameters - Off-site Residents**

| Exposure Parameter (units) | Value Adopted | | Reference |
|---|---|---|---|
| | Adult | Child | |
| Exposure Duration (years) | 29 | 6 | ASC NEPM (2013) - low to medium density residential. |
| Averaging Time (carcinogens) (years) | 70 | 70 | ASC NEPM (2013) - low to medium density residential. |
| Averaging Time (non-carcinogens) (years) | 29 | 6 | ASC NEPM (2013) - low to medium density residential. |
| Exposure Frequency (days/day) | 365 | 365 | ASC NEPM (2013) - low to medium density residential. |
| Exposure Time – Indoors and Outdoors (hours/day) | 24 | 24 | ASC NEPM (2013) - low to medium density residential. |
| Body Weight | 70 | 15 | ASC NEPM (2013) - low to medium density residential. |
| Daily Soil Ingestion Rate (mg/day) | 50 | 100 | ASC NEPM (2013) - low to medium density residential. |
| Exposed Skin Surface Area for Soil Contact ($cm^2$) | 6300 | 2700 | ASC NEPM (2013) - low to medium density residential. |
| Soil to Skin Adherence Factor ($mg/cm^2$) | 0.5 | 0.5 | ASC NEPM (2013) - low to medium density residential. Assumes 31.5% of total body surface area (20,000 $cm^2$) for an adult and 44.3% (6100 $cm^2$) for a child. |

| Exposure Parameter (units) | Value Adopted | | Reference |
|---|---|---|---|
| | Adult | Child | |
| Particulate emission factor (indoor air assumed equivalent to outdoor air) ($m^3$/kg) | 2.90E+10 | 2.90E+10 | ASC NEPM (2013) - low to medium density residential. |
| Inhalation Rate (mother) ($m^3$/hour) | 1.34 | - | Inhalation rate assuming 20 hours indoors at 1.17 $m^3$/hour and 4 hours outdoors at 2.2 $m^3$/hour. Only applicable to breast feeding mother. |

**Table 20 Human Behavioural Exposure Parameters - Off-site Recreational Users**

| Exposure Parameter (units) | Value Adopted | | Reference |
|---|---|---|---|
| | Adult | Child | |
| Exposure Duration (years) | 29 | 6 | ASC NEPM (2013) - recreational user. |
| Averaging Time (non-carcinogens) (years) | 29 | 6 | ASC NEPM (2013) - recreational user. |
| Averaging Time (carcinogens) (years) | 70 | 70 | ASC NEPM (2013) - recreational user. |
| Exposure Frequency (days/day) | 365 | 365 | ASC NEPM (2013) - recreational user. |
| Exposure Time – Outdoors (hours/day) | 2 | 2 | ASC NEPM (2013) - recreational user. |
| Body Weight | 70 | 15 | ASC NEPM (2013) - recreational user. |
| Daily Soil Ingestion Rate (mg/day) | 25 | 50 | ASC NEPM (2013) - recreational user. |
| Exposed Skin Surface Area for Soil Contact ($cm^2$) | 6300 | 2700 | ASC NEPM (2013) - recreational user. Assumes 31.5% of total body surface area (20,000 $cm^2$) for an adult and 44.3% (6100 $cm^2$) for a child. |
| Soil to Skin Adherence Factor (mg/$cm^2$) | 0.5 | 0.5 | ASC NEPM (2013) - recreational user. |
| Particulate emission factor (outdoor air) ($m^3$/kg) | 2.90E+10 | 2.90E+10 | ASC NEPM (2013) - recreational user. |
| Lung retention factor (dust inhalation) | 0.375 | 0.375 | ASC NEPM (2013) - recreational user. |

**Table 21 Human Behavioural Exposure Parameters - Off-site Commercial Workers**

| Exposure Parameter (units) | Value Adopted | Reference |
|---|---|---|
| Exposure Duration (years) | 30 | ASC NEPM (2013) - commercial/industrial. |
| Averaging Time – Carcinogens (years) | 70 | ASC NEPM (2013) - commercial/industrial. |
| Averaging Time – Non-Carcinogens (years) | 30 | ASC NEPM (2013) - commercial/industrial. |
| Exposure Time – Indoors and Outdoors (hours/day) | 9 | ASC NEPM (2013) - commercial/industrial. |
| Exposure Frequency (days/year) | 240 | ASC NEPM (2013) - commercial/industrial. |
| Particulate emission factor (indoor air assumed equivalent to outdoor air) ($m^3$/kg) | 2.90E+10 | ASC NEPM (2013) - commercial/industrial. |

# 7.0 Risk Characterisation

## 7.1 Methodology

The methodology and equations used to estimate risks for the HHRA are presented below for threshold and non-threshold CoPC.

### 7.1.1 Threshold Risk Estimates

Risks to human health for CoPCs assessed on the basis of a threshold approach were estimated by comparison of the exposure adjusted air concentration (µg/m$^3$) of each CoPC with its respective reference concentration (RfC, µg/m$^3$) allowable from the Site (i.e. the RfC minus background intakes). The resulting ratio, referred to as the hazard quotient, is derived in the following manner:

$$HQ = \frac{EC_{inh}}{RfC - background}$$

Where:

HQ = Hazard Quotient (unitless)

$EC_{inh}$ = Exposure adjusted air concentration (µg/m$^3$)

RfC = Tolerable Concentration in air (µg/m$^3$) – adjusted for background intake

A potentially unacceptable chemical intake/exposure is indicated if the EC exceeds the RfC (i.e. if the hazard quotient is greater than 1.0).

To assess the overall potential for adverse health effects posed by exposure to multiple chemicals, the hazard quotients for each chemical and exposure pathway relevant to a receptor are summed. The resulting sum is referred to as the hazard index (HI), and is calculated using the following equation.

$$HI = \sum_{i=1,\, j=1}^{n} HQ_{i,j}$$

Where:

HI = Hazard Index (unitless)

$HQ_{i,j}$ = Hazard Quotient for pathway *i* and chemical *j* (unitless)

n= Number of chemicals and/or pathways relevant to land use scenario

If the HI is less than one, then cumulative exposure to the CoPC is considered unlikely to result in an adverse effect. If the sum is greater than 1.0, a more detailed and critical evaluation of the hazards may be required, or appropriate risk management measures at the Site may need to be implemented (enHealth, 2012a).

### 7.1.2 Non-Threshold (Carcinogenic) Risk Estimates

Risks to human health for CoPC considered to be genotoxic carcinogens were estimated as the incremental probability of an individual developing cancer over a lifetime as a result of chemical exposure. The numerical estimate of incremental lifetime carcinogenic risk was calculated using the following relationship:

$$ILCR = EC_{inh} * IUR$$

Where:

ILCR = Incremental Lifetime Cancer Risk (unitless)

$EC_{inh}$ = Exposure adjusted air concentration (µg/m$^3$)

IUR = Inhalation Unit Risk (µg/m$^3$)$^{-1}$

To assess the overall potential for effects posed by simultaneous exposure to more than one chemical that is associated with non-threshold carcinogenic effects, the risk for each chemical and pathway were summed. The resulting sum is referred to as the cumulative incremental lifetime carcinogenic risk and is estimated as follows:

$$ILCR_{cum} = \sum_{i=1, j=1}^{n} ILCR_{i,j}$$

Where:

$ILCR_{cum}$ = Cumulative ILCR for a given receptor (unitless)

$ILCR_{i,j}$ = ILCR for chemical i and pathway j

*n* = Number of chemicals and/or pathways relevant to land use scenario.

This approach assumes that exposure to multiple carcinogens over a lifetime results in a cumulative effect, and therefore, exposures are summed over all intake routes.

## 7.2 Risk Acceptability Criteria

For non-threshold (carcinogenic) CoPC, the incremental lifetime cancer risk estimates for each receptor have been compared to an *acceptable* carcinogenic risk level of 1 in 100,000 ($1 \times 10^{-5}$) (enHealth, 2012a).

For threshold (non-carcinogens) CoPC, potentially *unacceptable* chemical intake/exposure is indicated if the exposure level exceeds the TDI or TC (i.e. if the HQ is greater than 1.0) (enHealth, 2012a).

Where the risk acceptability criteria for threshold and non-threshold CoPC are exceeded, a more detailed and critical evaluation of the risk may be conducted, or appropriate risk management measures may be recommended.

## 7.3 Summary of Risk Estimates

### 7.3.1 Inhalation Pathway Assessment

The risk calculation results are presented in **Appendix E**.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for vapour inhalation is presented in **Table 22** and **Table 23.**

**Table 22 Risk Characterisation Summary – Inhalation Pathway for Scenario 1 (Typical operating conditions)**

| Exposure Scenario | Threshold (HI) | Non-Threshold (ILCR) |
|---|---|---|
| **Maximum Annual Average EPCs** | | |
| Off-Site Resident | 6.60E-03 | 1.42E-07 |
| Off-Site Commercial Worker | 2.17E-02 | 4.00E-07 |
| Off-Site Recreational User | 7.99E-04 | 1.72E-08 |
| **Grid Maximum EPCs** | | |
| Off-Site Resident | 8.78E-02 | 1.89E-06 |
| Off-Site Commercial Worker | 2.17E-02 | 4.00E-07 |
| Off-Site Recreational User | 7.32E-03 | 1.58E-07 |

**Bold** text indicates exceedance of the risk acceptability criteria.

Using the maximum annual average EPCs and grid maximum EPCs for Scenario 1, estimated conservative screening (upper-bound) ILCR estimates for off-site residents, recreational users and commercial workers considered in this assessment were found to be below the adopted acceptable risk level of 1 x $10^{-5}$, and the calculated hazard indices were below the adopted acceptable hazard index of 1.0.

**Table 23 Risk Characterisation Summary – Inhalation Pathway for Scenario 2 (Proposed Maximum Licence Limit Operating Conditions)**

| Exposure Scenario | Threshold (HI) | Non-Threshold (ILCR) |
|---|---|---|
| **Maximum Annual Average EPCs** | | |
| Off-Site Resident | 8.34E-02 | 5.30E-07 |
| Off-Site Commercial Worker | 2.72E-01 | 1.48E-06 |
| Off-Site Recreational User | 1.00E-02 | 6.40E-08 |
| **Grid Maximum EPCs** | | |
| Off-Site Resident | **1.10E+00** | 7.02E-06 |
| Off-Site Commercial Worker | 2.72E-01 | 1.48E-06 |
| Off-Site Recreational User | 9.18E-02 | 5.85E-07 |

**Bold** text indicates exceedance of the risk acceptability criteria.

Using the maximum annual average EPCs and grid maximum EPCs for Scenario 2, estimated conservative screening (upper-bound) ILCR estimates for off-site residents, recreational users and commercial workers considered in this assessment were found to be below the adopted acceptable risk level of 1 x $10^{-5}$, and the calculated hazard indices (with the exception for the off-site Resident in the Grid Maximum Scenario) were below or equal to the adopted acceptable HI of 1.0. An off-site resident potentially exposed to the grid maximum concentrations during proposed maximum licence limit operational conditions resulted in a HI of 1.1, which is marginally above the adopted acceptable HI of 1.0. Inhalation of nickel dust was the primary contributor (46%) of the total inhalation risk.

It is considered that this scenario is overly conservative i.e. a resident exposed to the modelled maximum annual average concentration at the proposed maximum licence limit operational conditions of all CoPC, for 24 hours a day, 365 days a year for 30 years, and is unlikely to be realised. Additionally, it should be noted that the grid maximum location was identified approximately 80 m north-west of the Site, on land currently zoned as General Industrial and not as residential land (refer to **Section 4.1.3**).

### 7.3.2 Multiple Exposure Pathway Assessment

The risk calculation results are presented in **Appendix D**.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for multiple exposure pathways is presented in **Table 24** for Scenario 1 and **Table 25** for Scenario 2.

**Table 24 Risk Characterisation Summary – Multiple Exposure Pathways for Scenario 1**

| Exposure Scenario | Threshold (HI) | | Non-Threshold (ILCR) |
|---|---|---|---|
| | Adult | Child | |
| **Maximum Annual Average EPCs** | | | |
| Off-Site Resident – Inhalation of Vapour | 6.60E-03 | | 1.42E-07 |
| Off-Site Resident – Incidental Ingestion of Soil | 2.57E-13 | 2.40E-12 | 6.19E-19 |
| Off-Site Resident – Dermal Contact with Soil | 1.25E-14 | 2.51E-14 | 1.13E-18 |
| Off-Site Resident – Ingestion of Home-grown Produce | 6.74E-11 | 1.55E-10 | 8.19E-16 |
| Off-Site Resident – Ingestion of Eggs | 1.27E-11 | 2.55E-11 | 1.01E-16 |
| Off-Site Resident – Ingestion of Beef | 2.22E-11 | 3.89E-11 | 1.55E-15 |
| Cumulative Risk | 6.60E-03 | 6.60E-03 | 1.42E-07 |
| **Grid Maximum EPCs** | | | |
| Off-Site Resident – Inhalation of Vapour | 8.8E-02 | | 1.9E-06 |
| Off-Site Resident – Incidental Ingestion of Soil | 1.3E-12 | 1.2E-11 | 3.2E-18 |
| Off-Site Resident – Dermal Contact with Soil | 6.5E-14 | 1.3E-13 | 5.8E-18 |
| Off-Site Resident – Ingestion of Home-grown Produce | 3.5E-10 | 8.0E-10 | 4.2E-15 |
| Off-Site Resident – Ingestion of Eggs | 6.6E-11 | 1.3E-10 | 5.2E-16 |
| Off-Site Resident – Ingestion of Beef | 1.1E-10 | 2.0E-10 | 8.0E-15 |
| Cumulative Risk | 8.8E-02 | 8.8E-02 | 1.9E-06 |

**Bold** text indicates exceedance of the risk acceptability criteria.

Using the maximum annual average EPCs and grid maximum EPCs, estimated conservative screening (upper-bound) ILCR estimates for off-site residents considered in this multi-exposure parameter assessment for Scenario 1 were found to be below the adopted acceptable risk level of 1 x $10^{-5}$, and hazard indices were below the adopted acceptable hazard index of 1.0.

**Table 25 Risk Characterisation Summary – Multiple Exposure Pathways for Scenario 2**

| Exposure Scenario | Threshold (HI) | | Non-Threshold (ILCR) |
|---|---|---|---|
| | Adult | Child | |
| **Maximum Annual Average EPCs** | | | |
| Off-Site Resident – Inhalation of Vapour | 8.3E-02 | | 5.3E-07 |
| Off-Site Resident – Incidental Ingestion of Soil | 3.8E-12 | 3.5E-11 | 2.3E-18 |
| Off-Site Resident – Dermal Contact with Soil | 4.1E-13 | 8.1E-13 | 4.1E-18 |
| Off-Site Resident – Ingestion of Home-grown Produce | 1.0E-09 | 2.3E-09 | 3.0E-15 |

| Exposure Scenario | Threshold (HI) | | Non-Threshold (ILCR) |
|---|---|---|---|
| | Adult | Child | |
| Off-Site Resident – Ingestion of Eggs | 2.5E-10 | 5.0E-10 | 3.7E-16 |
| Off-Site Resident – Ingestion of Beef | 4.3E-10 | 7.6E-10 | 5.7E-15 |
| Cumulative Risk | 8.3E-02 | 8.3E-02 | 5.3E-07 |
| **Grid Maximum EPCs** | | | |
| Off-Site Resident – Inhalation of Vapour | **1.1E+00** | | 7.0E-06 |
| Off-Site Resident – Incidental Ingestion of Soil | 2.0E-11 | 1.8E-10 | 1.2E-17 |
| Off-Site Resident – Dermal Contact with Soil | 2.1E-12 | 4.2E-12 | 2.1E-17 |
| Off-Site Resident – Ingestion of Home-grown Produce | 5.3E-09 | 1.2E-08 | 1.5E-14 |
| Off-Site Resident – Ingestion of Eggs | 1.3E-09 | 2.6E-09 | 1.9E-15 |
| Off-Site Resident – Ingestion of Beef | 2.2E-09 | 3.9E-09 | 2.9E-14 |
| Cumulative Risk | **1.1E+00** | **1.1E+00** | 7.0E-06 |

**Bold** text indicates exceedance of the risk acceptability criteria.

As presented in **Table 25**, hazard indices for the multiple exposure pathway assessment by off-site residents were typically below the adopted acceptable hazard index of 1.0. The calculated risk estimates for the inhalation of vapour and particulates by off-site residents using the grid maximum concentrations were marginally above the adopted acceptable hazard index of 1.0 for threshold compounds, as discussed in **Section 7.3.1.**

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from vapour and particulates emitted from the Site were considered low and acceptable.

### 7.3.3 Infant Ingestion of Breastmilk Pathway Assessment

The risk calculation results are presented in **Appendix E**.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for an infant ingestion of breastmilk is presented in **Table 26** for Scenario 1 and **Table 27** for Scenario 2.

**Table 26 Risk Characterisation Summary – Infant Ingestion of Breastmilk for Scenario 1**

| Exposure Scenario | Child | |
|---|---|---|
| | Non-Threshold (ILCR) | Threshold (HI) |
| **Maximum Annual Average GLCs** | | |
| Infant Ingestion of Breastmilk (mother exposed to multiple exposure pathways) | 2.12E-13 | 1.27E-03 |
| **Grid Maximum GLCs** | | |
| Infant Ingestion of Breastmilk (mother exposed to multiple exposure pathways) | 2.83E-12 | 1.69E-02 |

**Bold** text indicates exceedance of the risk acceptability criteria.

Using the maximum annual average GLCs and grid maximum GLCs for Scenario 1, the estimated conservative screening (upper-bound) ILCR estimate for the infant ingestion of breastmilk pathway was found to be below the adopted acceptable risk level of 1 x $10^{-5}$, and the hazard index was below the adopted acceptable hazard index of 1.0.

Overall the estimated health risks to an infant from the ingestion of breastmilk were considered low and acceptable.

**Table 27 Risk Characterisation Summary – Infant Ingestion of Breastmilk for Scenario 2**

| Exposure Scenario | Child | |
|---|---|---|
| | Non-Threshold (ILCR) | Threshold (HI) |
| **Maximum Annual Average GLCs** | | |
| Infant Ingestion of Breastmilk (mother exposed to multiple exposure pathways) | 7.85E-13 | 1.31E-02 |
| **Grid Maximum GLCs** | | |
| Infant Ingestion of Breastmilk (mother exposed to multiple exposure pathways) | 1.0E-11 | 1.7E-01 |

**Bold** text indicates exceedance of the risk acceptability criteria.

Using the maximum annual average GLCs and grid maximum GLCs for Scenario 2, the estimated conservative screening (upper-bound) ILCR estimate for the infant ingestion of breastmilk pathway was found to be below the adopted acceptable risk level of 1 x $10^{-5}$, and the hazard index was below the adopted acceptable hazard index of 1.0.

Overall the estimated health risks to an infant from the ingestion of breastmilk were considered low and acceptable.

.

# 8.0 Uncertainty and Sensitivity Analysis

The risk assessment process involves a number of assumptions regarding Site conditions, human exposure and chemical toxicity. These assumptions are based on Site-specific information (where available), but it is not always possible to fully predict or describe site conditions and human activities at a Site for the exposure period considered in the risk assessment. The assumptions adopted for this risk assessment were therefore generally selected to be conservative in nature, in order to evaluate an assumed reasonable maximum exposure scenario and provide a deliberate margin of safety.

A discussion of some of the key uncertainties associated with different components of the risk assessment process, and an input parameter sensitivity analysis, is provided below.

## 8.1 Air Dispersion Modelling

The atmosphere is a complex, physical system and the movement of air in a given location is dependent on a number of variables, including temperature, topography and land use, as well as larger-scale synoptic processes. Dispersion modelling is a method of simulating the movement of air pollutants in the atmosphere using mathematical equations. The model equations necessarily involve the current understanding of the complex environmental interactions and chemical reaction processes involved, available input data, processing time and data storage limitations. The model configuration particularly affects model predictions during certain meteorological conditions and source emission types. For example, the prediction of pollutant dispersion under low wind speed conditions (typically defined as those less than 1 m/s) or for low-level, non-buoyant sources, is problematic for most dispersion models. To accommodate these effects, the model is configured to provide conservative estimates of pollutant concentrations at particular locations.

The results of dispersion modelling, therefore, provide a conservative indication of the worst likely level of pollutants within the modelling domain. While the models, when used appropriately and with high quality input data, can provide very good indications of the scale of pollutant concentrations and the likely locations of the maximum concentrations occurring, their outputs should not be considered to be representative of exact pollutant concentrations at any given location or point in time.

To account for the variability in air dispersion modelling, maximum 1-hour annual average ground level concentrations at each receptor were adopted in the HHRA as these were considered to represent the worst case exposure scenario. Maximum dust deposition rates (as $mg/m^2$/year) for selected bioaccumulative CoPC within the grid were also adopted in the HHRA. The maximum ground level concentrations and deposition rates identified at off-site receptors from the air dispersion modelling are likely to overestimate exposure in the areas assessed.

## 8.2 Ingestion Models

The assessment of potential multiple pathway exposure is based on a number of conservative assumptions which are likely to result in an assessment which is in the upper estimate of exposure. Namely the assessment relies on deposition rates which are determined not taking into account the terrain (i.e. buildings) which may restrict flow path for deposition. The estimated concentrations are based on the maximum deposition rates determined to be representative of exposures over a lifetime to multiple pathways which are unlikely to be representative of the usual residential exposure. They are presented however to account for the potential that there may be a resident in which all of the estimated exposure scenarios apply.

## 8.3 Toxicity Assessment

In general, the available scientific information is insufficient to provide a thorough understanding of all of the potential toxic properties of chemicals to which humans may be exposed. It is necessary, therefore, to extrapolate these properties from data obtained under other conditions of exposure and involving experimental laboratory animals. This may introduce two types of uncertainties into the risk assessment, as follows:

a) those related to extrapolating from one species to another; and

b) those related to extrapolating from the high exposure doses, usually used in experimental animal studies, to the lower doses usually estimated for human exposure situations.

The majority of the toxicological knowledge of chemicals comes from experiments with laboratory animals, although there may be interspecies differences in chemical absorption, metabolism, excretion and toxic response. There may also be uncertainties concerning the relevance of animal studies using exposure routes that differ from human exposure routes. In addition, the frequent necessity to extrapolate results of short-term or sub-chronic animal studies to humans exposed over a lifetime has inherent uncertainty.

In order to adjust for these uncertainties, IURs and RfCs incorporate safety factors that may vary from 10 to 10,000. The US EPA assumes that humans are as sensitive to carcinogens as the most sensitive animal species. The policy decision, while designed to minimise the potential for underestimating risk, introduces the potential to overestimate carcinogenic risk. Conversely, it also does not allow for the possibility that humans may be more sensitive than the most sensitive animal species.

The model used by the US EPA to determine slope factors is a linearised multistage model, which provides a conservative estimate of cancer risk at low doses and is likely to overestimate the actual slope factor. It is assumed in this approach that a genotoxic mechanism applies, however, most carcinogens do not actually cause cancer by this mechanism. The result is that the use of slope factors has the general effect of overestimating the incremental cancer risks.

The approach for evaluating risks to mixtures of chemicals assesses dose additively and does not account for potential synergism, antagonism or differences in target organ specificity and mechanism of action. In general, the additive approach has the effect of overestimating the risks. This is because chemicals that have no additive effects are included together as well as chemicals that may have additive effects.

## 8.4 Background Exposures

For metals, the available background exposure percentages adopted by the ASC NEPM (2013) were applied. Background exposures to other metals (Sb and Pb) were considered to be negligible.

An average lifetime daily exposure (ALDE) was calculated for dioxins and furans using findings of a blood serum study and body burdens (DEH, 2004). The mean ALDE was estimated as 1.32 TEQ pg/kg bw/day (minimum of 0.13 pg/kg bw/day for ages under 16 years; maximum of 2.96 pg/kg bw/day for 60 years and older). AECOM converted 1.32 TEQ pg/kg bw/day to months, which equalled 40.15 pg/kg bw/month. This is 57% of the tolerable monthly intake (TMI) of 70 pg/kg bw/month (DEH, 2005).

Background exposure to benzene by the general population was considered to be 20%. This is in accordance with recommendations made by Friebel & Nadebaum (2011) to be protective of the majority of residential properties and for Sydney CBD where people spend some time at ground level. For toluene and xylenes, the background concentrations were less than 3% of the threshold toxicity criteria in the worst reported area and therefore it was concluded that the inclusion of background ambient air concentrations do not contribute significantly to the total allowable exposure used to derive HSLs. A background exposure of 0% was adopted for toluene and xylenes.

In absence of compound-specific background exposure data, the background exposure for semi or volatile CoPC has been set at 10% in accordance with the total petroleum hydrocarbon (TPH) background exposure allocation adopted by Friebel & Nadebaum (2011).

In cases where background exposure is considered to be essentially negligible (contributing to less than 5% of the threshold TRV), no background exposure has been applied.

Adopted background exposure percentages are provided in **Appendix F**.

## 8.5 Human Exposure Parameters

Risk assessment requires the adoption of several assumptions in order to assess potential human exposure. This risk assessment included assumptions about general characteristics and patterns of human exposure relevant to the Site. The assumptions used for identified off-site residential, recreational and commercial receptors adjacent to the Regain Tomago Facility were conservative and developed to provide an estimate of reasonable maximum exposures rather than the actual exposures. This approach is likely to overestimate the associated health risks.

## 8.6 Sensitivity of Modelling Input Parameters

When undertaking quantitative risk modelling it is important to understand the potential effects that exposure parameters may have on the overall calculated risks. **Table 28** provides a summary of the main assumptions adopted in the current risk assessment.

**Table 28 Sensitivity of Modelling Input Parameters**

| Parameter | Value Adopted in Risk Assessment (unit) | Outcome in Risk Assessment |
|---|---|---|
| Exposure Time | 24 hours per day | It has been assumed that residential receptors will be exposed to contamination for 24 hours a day, which is considered the most conservative value. A reduction in this value will reduce the overall estimated health risks. |
| Exposure Frequency | 365 days per year | It has been assumed that residential receptors will be exposed to contamination for 365 days a year, which is considered the most conservative value. A reduction in this value will reduce the overall estimated health risks. |
| Exposure Duration | Resident – 29 (adult) and 6 (child) years<br><br>Commercial Worker – 30 years | It has been assumed that a resident will be exposed to contamination for 29 years for an adult and 6 years for a child.<br><br>It has been assumed that a commercial worker will be exposed to contamination for 30 years.<br><br>These exposure duration periods are in accordance with the ASC NEPM (2013) and are considered to be conservative. A reduction in this value will reduce the overall estimated health risks. |
| Daily Soil Ingestion Rate | 50 mg/day (adult) and 100 mg/day (child) | It has been assumed that an adult resident would ingest 50 mg of soil each day, while a child would ingest 100 mg of soil each day.<br><br>These soil ingestion rates are in accordance with the ASC NEPM (2013) and are considered to be conservative. A reduction in this value will reduce the overall estimated health risks. |
| Exposed Skin Surface Area for Soil Contact | 6300 $cm^2$ (adult) and 2700 $cm^2$ (child) | It has been assumed that 31.5% of an adult resident's body surface area would be exposed to contaminated soil, while 44.3% of a child's body surface area would be exposed to contaminated soil.<br><br>These exposed skin surface areas are in accordance with the ASC NEPM (2013) and are considered to be conservative. A reduction in this value will reduce the overall estimated health risks. |

| Parameter | Value Adopted in Risk Assessment (unit) | Outcome in Risk Assessment |
|---|---|---|
| Soil to Skin Adherence Factor | 0.5 mg/cm$^2$ | A soil to skin adherence factor of 0.5 mg/cm$^2$ is recommended in the ASC NEPM (2013) for all receptors, including residents. A reduction in this value will reduce the overall estimated health risks. |

# 9.0 Conclusions

AECOM Australia Pty Ltd (AECOM) was engaged by Regain Services Pty Ltd (Regain) to undertake a Human Health Risk Assessment (HHRA) for Tomago facility located within the Tomago Aluminium site (the Site). The Site location is shown on **Figure F1**, **Appendix A**, while the Site setting and surrounding land uses is illustrated on **Figure F2, Appendix A**.

The objective of the HHRA is to assess potential future human health risks to surrounding residents, commercial workers and recreational users, resultant from the exposure to Regain Tomago air emissions associated with the processing of SPL during the normal operations and at the proposed maximum EPL limits of the facility.

It is to be noted that this assessment considered air quality (i.e. vapour and particulates) only. Noise, vibration, odour, soil and water were not considered in this assessment.

Two operating scenarios (typical operating conditions and operational conditions at the proposed maximum EPL limits) were considered as part of the HHRA. Potential acute or upset conditions were not assessed.

The following human receptors were considered in this HHRA based on the surrounding land uses:

- Off-site residents, includes caravan parks
- Off-site recreational users
- Off-site commercial workers.

Exposures to air and deposition of particulates (which could deposit onto soil) was identified as a potential exposure pathway which warranted higher tiers of assessment. Pathways that have been considered to be complete for the Site and therefore were assessed in the HHRA include:

- Inhalation of vapours and dust in indoor and outdoor air (inhalation pathway assessment).
- Ingestion of home-grown fruit and vegetables by residents (multiple exposure pathway assessment).
- Ingestion of eggs from home-grown chickens by residents (multiple exposure pathway assessment).
- Ingestion of home-grown beef (multiple exposure pathway assessment).
- Ingestion of breast milk by infants (multiple exposure pathway assessment).

The maximum annual average ground level concentrations ($100^{th}$ percentile) at each receptor and grid maximum concentrations were adopted for Scenario 1 (normal operational conditions) and Scenario 2 (operational conditions at proposed maximum licence limits). Additionally, annual dust deposition rates for the identified bioaccumulative contaminant were used to estimate contaminant concentrations in soil for consideration in the multiple pathway assessment for both scenarios.

Scenario 1 (Normal Operational Conditions)

Using the maximum annual average EPCs and grid maximum EPCs, estimated conservative screening (upper-bound) ILCR estimates for off-site receptors considered in the inhalation and multiple pathway assessments were found to be below the adopted acceptable risk level of $1 \times 10^{-5}$, and hazard indices were below the adopted acceptable hazard index of 1.0.

Scenario 2 (Operational Conditions at Proposed Maximum Licence Limits)

Using the maximum annual average EPCs estimated conservative screening (upper-bound) ILCR estimates for off-site receptors considered in the inhalation and multiple pathway assessments were found to be below the adopted acceptable risk level of $1 \times 10^{-5}$, and hazard indices were below the adopted acceptable hazard index of 1.0.

Using the grid maximum EPCs estimated conservative screening (upper-bound) ILCR estimates for off-site residents considered in this multi-exposure parameter assessment for Scenario 2 were found to be below the adopted acceptable risk level of $1 \times 10^{-5}$, and the hazard indices were marginally above the adopted acceptable hazard index of 1.0. However, this scenario is considered to be overly

conservative i.e. a resident exposed to the modelled maximum annual average concentration at the proposed maximum EPL limits for all CoPC, for 24 hours a day, 365 days a year for 30 years. This Scenario is representative of theoretical worst case impacts using the expected licence limits and is unlikely to be realised. Additionally, it should be noted that the grid maximum location was identified approximately 80 m north-west of the Site, on land currently zoned as General Industrial and not as Residential land (refer to **Section 4.1.3**).

While these risk estimates were based on a number of conservative assumptions and were considered to overestimate actual risk to receptors, it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels. Overall the estimated health risks to off-site residents, recreational users and commercial workers from inhalation and residents from direct contact pathways under normal and proposed maximum licence limit operating conditions were considered low and acceptable.

# 10.0 Limitations

This document was prepared for the sole use of Regain Services Pty Ltd. This party is the only intended beneficiary of our work. Any advice, opinions or recommendations contained in this document should be read and relied upon only in the context of the document as a whole and are considered current to the date of this document. Any other party should satisfy themselves that the scope of work conducted and reported herein meets their specific needs. AECOM cannot be held liable for third party reliance on this document, as AECOM is not aware of the specific needs of the third party.

This document was prepared for the purpose described herein and as agreed to by Regain Services Pty Ltd. From a technical perspective, the subsurface environment at any site may present substantial uncertainty. It is a heterogeneous, complex environment, in which small subsurface features or changes in geologic conditions can have substantial impacts on water and chemical movement. Uncertainties may also affect source characterisation assessment of chemical fate and transport in the environment, assessment of exposure risks and health effects, and remedial action performance.

AECOM's professional opinions are based upon its professional judgement, experience and training. It is possible that additional testing and analysis might produce different results and/or different opinions. AECOM has limited its assessment to the scope agreed upon with it client. AECOM believes that its opinions are reasonably supported by the testing and analysis that have been done and that those opinions have been developed according to the professional standard of care for the environmental consulting profession in this area at this time. That standard of care may change and new methods and practices of exploration, testing, analysis and remediation may develop in the future, which might produce different results. AECOM's professional opinions contained in this document are subject to modification if additional information is obtained through further investigation, observations, or testing and analysis during any future assessment or remedial activities.

This page has been left blank intentionally.

**Notes:**
(a) Converted from parts per million (or nanograms per cubic metre) using molecular weight for each CoPC published by RAIS (2015). Standard temperature and pressure assumed i.e. 25ºC and 1 atm
(b) Converted published unit risk value for carcinogenic CoPC using an acceptable risk level of 1 x $10^{-6}$
(c) Value for Hexachlorodibenzo-p-dioxin, Mixture adopted as a surrogate guideline value
(d) Value for Chromium(VI) adopted for conservatism (no RSL for Chromium III).
(e) Value for mercuric chloride (and other mercury salts) and mercury (elemental) adopted.
(f) Value for nickel acetate, nickel carbonate, nickel carbonyl, nickel hydroxide, nickel oxide, nickel soluble salts and nickelocene adopted.
(g) The more conservative US EPA value for lead has been adopted, as per NSW EPA recommendation.

* The speciated breakdowns of the Total PAH stack testing results collated from 2014 to 2016, indicate that the average contribution of BaP to the Total PAH is 0.0099%, and the average contribution of naphthalene and 2-methylnapthalene to the Total PAH is 22% and 42% respectively. Thus, it was considered overly conservative to assume BaP represented 100% the Total PAH concentration. As such, only the carcinogenic PAHs (Benzo(a)anthracene, Benzo(b+j)fluoranthene, Benzo(k)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz(a,h)anthracene, and Indeno(1,2,3-c,d)pyrene) have been assessed as BaP, and the average percent contribution of the carcinogenic PAHs to the Total PAH is 0.67%. The remaining contribution of PAHs (99.3%) has been assessed as naphthalene. The speciated breakdowns of the Total PAH stack testing results are presented in Appendix G

Exceedances of screening critera are highlighted in gray
